MAN'S WORK.

By ALAN SULLIVAN,
Author of *The Passing of Oulibut*, *Blantyre-Alien*, *The Inner Door*, &c.

CHAPTER I.

I.

FROM the office-windows of Burley & Betts, in a tall building in Los Angeles, one could see the far crests of the Sierra Madre range filling the eastern sky, massive and imposing, lifting serenely above the haunts and doings of men. Of those whose eyes wandered frequently to this majestic spectacle, none surveyed it with more thankfulness than John Shanklin, senior clerk. He began to stare at it when first Burley & Betts made room for him in their expanding business, and continued to be conscious of it all through the four years that preceded his appointment as senior clerk. And on the day when Burley intimated in his deep, rumbling voice that by the end of the year, if things continued to be satisfactory, there might be room for a junior partner in the firm, it seemed that the Sierra Madre was dipped in golden light.

He was coming into his own by hard plugging, backed by a fixed belief that there was as much romance to be found in business as anywhere else, and that fundamentally it was important to be two things: straight and constructive. He took pride in doing his work, so that when he had finished it needed no further touches. Sometimes it seemed that, in law, one lived by disentangling the knots that other people unconsciously tied. At this Shanklin always smiled. He was fond of undoing knots, and on one particular morning, when the Sierra Madre looked more inviting than ever, he leaned back in his chair, pursed his firm young lips, and wondered what Courtney Brooks wanted to talk about at the appointment Burley had made for his client at eleven o'clock. Brooks was not the man to get himself entangled.

From this he wandered into a silent analysis of the visitor he now awaited. There was a particular reason why he should like Brooks—he had quite honestly tried, and tried hard. But, for all the man's hospitality, joviality, and apparent good-fellowship, Shanklin entertained an uncomfortable conviction that it was unfortunate he was his daughter's father. From which it may be deduced how the land lay.

Presently the door opened, and Brooks came in, accompanied by Sitwell, his partner. It had been suggested by a cynic that Brooks did the things which Sitwell couldn't do, that the latter did the things which Brooks wouldn't, and that therein lay the secret of their success. When Brooks was loud and hearty, his partner was suave and ingratiating. When Brooks boomed things out, Sitwell suggested them. When Brooks bluffed, Sitwell finessed. And Shanklin, regarding them with quiet, steady eyes, was compelled to admit that to all appearances the system worked like a well-oiled machine.

'Morning, John,' sounded the big voice, and a large, soft palm engulfed his fingers. 'You know Sitwell—so we 'll get to business.'

Sitwell, a tall, lean man of about thirty-five, nodded affably and sank into a leather-covered chair. He was dressed with the utmost care, and for a fraction of a second Shanklin wondered whether the perfection of his attire was a matter of natural taste or the result of painstaking effort. He had an idea that Sitwell would dress perfectly even in the wilderness.

'Won't keep you long this morning, John,' began Brooks comfortably. 'In fact, we could have fixed the thing up last night if you had come round. Where were you?'

'Working—looking up matters for a case that 's on this afternoon.'

Brooks grinned. 'Well, Claudia was disappointed—but I guess she won't criticise under the circumstances. Look over these, will you?'

He laid some papers on the flat-topped desk, and the young lawyer, glancing through them rapidly, noted that they were deeds for some fifty acres of land not far from Los Angeles. His brows went up a little.

'Going farming, Mr Brooks?'

The big man chuckled. 'Not on your life. Those are oil lands—or they 're going to be before long. I want a charter to operate and sell stock—the usual thing, you know—non-personal liability stock.'

 [*All Rights Reserved.*]

'You propose to incorporate on these holdings?'

Something in the steady tones drew a quick glance.

'Sure—why not?' The big man wheeled on his chair. 'By George! that's a great view you've got from here—can see the Observatory—eh?'

'Yes, we can see the Observatory.' Shanklin's voice was colourless. 'What capital had you thought of?'

Brooks turned suddenly to his partner. 'We agreed on two million—to sell at ten cents. But I've an idea now that we might cut that down by a quarter.'

Sitwell leaned slightly forward, pressed together the tips of his manicured fingers, and regarded them intently. Presently he looked up.

'We propose to retain one-third of the total shares for property and promotion—and I'm of the opinion that we can raise one hundred and thirty-three thousand dollars just as easily as a hundred thousand.'

'Well, you ought to know,' grunted the other; then, glancing at Shanklin, 'Sitwell is the financial end of our team.'

Shanklin did not answer Ever since he had joined Burley & Betts an important part of the business had been corporation work. It had given him an insight into matters sealed to the everyday man. At times it was difficult to control his impulses when things were egregiously undesirable, but, he always reflected, he was a lawyer, and not a judge. As to oil and oil lands, he had acquired valuable experience—which (it occurred at times) he might easily have used to his own definite advantage. But of all the incorporations which had come into the hands of Burley & Betts this was the wildest.

The oil lands of the Los Angeles district had to all present knowledge been accurately determined. These strata lay in recognised areas and at approximately well-known depths. Along their strike, and up to a certain distance on either side of it, there was the chance—the fair chance—of finding oil. But outside of this the chance was, to say the least, remote. And here on his table lay deeds for lands far removed from any oil strata, for which Brooks had paid some five thousand dollars, and which he proposed—as part, and only part, of the game—to resell to the public at a stupendous profit.

The big man lit a fat, black cigar. 'It may interest you to know, John, that my bunch of stock goes straight to Claudia just as soon as it's issued. She'll have to keep it off the market for six months, but after that I don't care.'

Shanklin drew a long breath. Involuntarily his eyes wandered over Brooks's shoulder to the Sierra Madre mountains. It seemed they had lost their colour and turned a cold steel-gray. It struck him, curiously, that this was the colour of fortitude. 'Will you be passing again this morning?' he asked quietly. 'I'd like to look into this before I say anything.'

Sitwell's lean face assumed the slightest tinge of surprise. The thing was so simple—it had been done so often before—that his instincts were at once aroused. The way Sitwell worked was to try to make himself feel as he reasoned the other man felt, and proceed from that.

'You don't anticipate any difficulty in getting a charter, do you?' He gathered himself, and stood by the door, tall and graceful.

Shanklin shook his head. 'You'll have no difficulty in getting a charter,' he answered diplomatically.

'What's the matter with you, Sit? Give the man a chance,' blurted Brooks, looking genuinely puzzled.

'Nothing—yet;' then, with a quick glance, 'We'll be back in an hour.'

II.

The door closed behind them, and Shanklin perceived that the thing that again and again he had prayed might not come had indeed come, and had brought with it an intensified moment he was loath to face. In the previous year (he had read a day or so ago) countless thousands had been ruined in his own country by speculation in fraudulent oil companies. The tale depressed him as much by the gullibility of the public as by the methods used to defraud. And now the hour had arrived for him to announce where he stood.

His mind turned instinctively to Claudia Brooks. She knew nothing of it all; but if she did know, where would she stand? At this his heart slowed a little, and he strove to remember that it is the business of most men to decide for themselves without judging others. But Claudia would be intimately affected by his decision. Their engagement had not been announced, though it was generally understood. She fascinated and altogether possessed him. Her mother had died when she was still a child, and for years she had been to her father so much more than only a daughter that the two were wrapped up in each other. Shanklin might be her fiancé, but Brooks was king—and the king could do no wrong. And that made the young man think harder than ever.

Behind all this was Sitwell, cool and debonair. It was said that, had not John Shanklin happened along at the opportune moment, Claudia would have married her father's partner, who was only some ten years older than herself. Whatever Sitwell might feel about it now, he betrayed nothing. He did not appear to avoid Shanklin, but the two had met but seldom. It is probable that the latter, in the joy of success, underestimated his rival, so brightly was the

sun shining on his own future; but to others Sitwell seemed to take life like a game of chess, which he played with marked astuteness, covering his moves with a maximum of skill. As Claudia's rejected suitor, he was not less attentive than formerly; and now to Shanklin, faced with a great decision, this took on a peculiar significance.

Then there was Burley & Betts. Betts was the San Francisco partner, and but rarely came to Los Angeles. It was to Burley that Shanklin looked, a little man with bushy brows, a deep, volcanic voice, and a bulldog face. Burley was accustomed to having his own way, and this was, no doubt, largely due to the degree to which the formidableness of his manner had surmounted the insignificance of his person. There was something electric in his attitude. When his mood was one of approbation, the entire office staff was conscious of a pleasant tingling in the air. When he disapproved, he radiated something that spread like an approaching thunder-storm, and was just as discomfiting. What would Burley say to all this?

By the time Shanklin's hour of grace was nearly up, the matter had come to an irreducible minimum. He must contrive that, without antagonising Brooks, the proposed charter should be looked after either by Burley himself or in some other office. To manage this he must trust to his own wits. It was quite clear that he could not undertake the work personally, no matter whither Brooks's bunch of shares was destined to go. He was drawing a fine distinction between his duty and what he conceived to be his integrity. But a life without such distinctions was, he quite deliberately decided, not the life he wanted. As for Claudia, his fate lay on the knees of the gods. So when the clock pointed to the hour he sat up in his chair, glanced first at the Sierra Madre and then at the door, and directed that Brooks and Sitwell be shown in as soon as they arrived. Presently the two entered, and he drew a long breath.

Ten minutes later Brooks heaved his big body out of his chair. He looked puzzled, but there was an understanding twinkle in his eye.

'Then I take it, John, that for some reason, which you haven't made very plain, you don't particularly want to act for us?' He said this in a voice which was in no way offended, but held a note of surprise.

Shanklin nodded, conscious of a vast relief. He felt that never before had he crossed such thin ice, and with such success. Sitwell's expression had roused his apprehension once or twice, but now the younger man's face was blank.

'If it's all the same to you.'

'Sure; but I had an idea I'd like to keep the business—well—sort of in the family,' said Brooks reflectively. 'However, you will speak to Burley, so he can't misunderstand?'

'Yes.' Shanklin had an immediate conviction that with Burley the ice would be thinner than ever, for it was not the custom of the firm to decline business under any pretext.

Brooks moved towards the door, glancing once or twice at the young lawyer as though it were in his mind to speak, and it struck Shanklin that in his manner there was something more than regret. It was as though he interpreted the real motive for this unsuspected decision, and silently sympathised with it so far as his position permitted. In that instant Shanklin got a sudden insight into the character of the father of the girl he loved, and perceived in him a man who primarily had been honest, but whose natural instincts had been suffocated by the desire for easy money.

'Come on, Sitwell; there's another lawyer in this building.'

But Sitwell, who had also risen, stood motionless, apparently examining the lining of his hat. His lips, slightly compressed, gave Shanklin a swift sense of discomfort. 'Just one thing, Brooks, before we go. Mr Shanklin hasn't taken us very much into his confidence as to his real reasons. Why not see Burley yourself?'

'What for?'

'To get at the bottom of this. . . . Ah!'

The door was flung open, and a little man swept into the room like a sirocco. 'Excuse me, gentlemen, but I left a brief here this morning.' He began to ferret about on Shanklin's desk. 'We seem to have what you'd call the loose-leaf system in this office.'

Sitwell smiled slightly. 'Glad you came in. I was just going to tell you that we're both sorry your office can't do our work.'

'Isn't our office as good as any other?' snapped Burley, continuing to search. Then, as though realising fully what had been said, he straightened up. 'What the devil are you talking about?'

'Come on, Sitwell; it doesn't matter,' put in Brooks hastily.

But Sitwell held his ground. 'It's only that Mr Shanklin is too—too occupied with other matters to attend to us,' he said coolly.

Burley dropped a handful of papers and stared, his eyes contracting to pin-points. 'What are you talking about?'

Sitwell put on his hat, pushed his arm into that of his partner, and moved towards the door. 'Ask him,' he said, jerking his chin towards Shanklin.

III.

The sound of steps died out, and Burley, clearing his throat, spoke with difficulty. 'What is all this tomfoolery? Aren't you preparing that charter?'

Shanklin shook his head. He was trying desperately to pull himself together.

'And may I take the liberty of asking why?' The senior partner's voice took on a certain icy significance.

The chief clerk stared first at the Sierra Madre, as though in a swift appeal for help, then at the angered face. 'It's rotten business—rotten all through,' he said slowly.

Burley's thick eyebrows arched into a black curve. 'Since when have you been on the bench?'

Shanklin's nerves steadied a little. 'You know what I mean, sir.'

'Go on.'

'Brooks is incorporating, and is going to sell worthless stock to ignorant people. I don't want to help him do it.'

Burley leaned forward a little. 'And you undertake to pass judgment on the motives of clients who come to my office for legal assistance?'

'There's lots of clean business to be had, sir. This isn't clean.'

'A Daniel come to judgment—and in Los Angeles. Mr Shanklin, listen to me for a minute. I won't keep you long. Every individual has certain rights as a citizen: some of them are most easily secured by the aid of a lawyer. You undertake to criticise what he is going to do with those rights after he gets them. I didn't know you were such a fool. I'm sorry, because things looked well for you here; now they don't—and you'd better get out. Do you think,' he added with rising anger, 'that I'm going to have my business spoilt by a crazy altruist?'

Shanklin felt a little sick. The thing had come more quickly than he had dreamed it could. He glanced at Burley, and meeting the hot eyes, looked away. Was it possible that, after all, he was discarding the bone for the shadow? And just then there stirred within him the profound assurance that, however crazy all this might seem, he was, at the bottom, right. He was staking everything he had for the one thing that he felt counted most—his self-respect. There was no time to moralise now. Burley stood there.

'I can't help what you think, sir. I only know what I feel. I'm sorry, but I can't put a stroke of a pen to that charter.' He looked up suddenly. 'You know it's a rotten thing yourself—you saw the deeds. I may be an altruist, but I'm not a fool.'

'When I want you to decipher my mind for me, young man, I'll send for you. Meantime you're too expensive for this firm. Come in, when you are ready, and get your cheque.'

He stumped out, and Shanklin stared after him. Then, quite methodically, the chief clerk put his papers in order, realising dully that never had his work looked so inviting as at this moment. From a top drawer he took out a photograph of Claudia Brooks, regarded it hungrily, and put it in his pocket. In an hour the desk was covered with neatly folded packets, each dated and labelled. From the book-cases he took a few volumes—his own—wondering where he would use them next. With a sigh that was undisguised he went into Burley's office.

The little man was sitting, chin in hand. The anger had died in his face, and it wore an expression that spoke of his intent to do a disagreeable thing as decently as possible. As Shanklin came in he motioned to a chair.

'I'm sorry to part with you—as I would with any man who has worked as hard as yourself. But what happened this morning convinces me—quite unexpectedly—that you're not built on the lines of a successful lawyer. You're cursed with too many self-searchings, and I advise you to get into something else. Here's your cheque.'

Shanklin took it without a word, and, glancing at it, saw that Burley had given him a bonus of six months' salary. His face reddened. 'What's this for, sir?'

'None of your business. Where are you going?'

'I don't know yet.' Shanklin's voice was shaky. An extra two thousand dollars! He had not dreamed of it.

'Well, if you get stuck, and need any sound legal assistance, come in and see me. It won't cost you anything.'

Shanklin nodded. He found it curiously hard to speak.

Burley got out of his chair and put a hand on the young man's shoulder. 'When I was your age I remember feeling pretty much about things as you do now. I got over it—whether for better or for worse I don't know; but I reckon you won't—and that may be a handicap. I guess the world needs fellows like you just as much as men like me. I can't keep you here—but'—he hesitated a moment, while his face softened perceptibly—'good luck to you; and if I can help, let me know.'

Long after Shanklin had left him the senior partner stood at the window, his head pushed forward, his hands deep in his pockets. He had done the only thing it was possible to do, and done it as decently as he could; but the affair had taken him back to the days of his youth. Just now he was balancing material success and progress against the dream and the glory that would never come again. He roused himself with the reflection that had he a son of his own he would have been inwardly thankful were he like the late chief clerk.

(Continued on page 21.)

THE SEVEN LAMPS OF ADVOCACY.*

By His Honour Judge PARRY.

I.—THE LAMP OF HONESTY.

The Seven Lamps of Advocacy are ***Honesty, Courage, Industry, Wit, Eloquence, Judgment, and Fellowship.***

THE great advocate is like the great actor: he fills the stage for his span of life, succeeds, gains our applause, makes his last bow, and the curtain falls. Nothing is so elusive as the art of acting, unless indeed it be the sister art of advocacy. You cannot say that the methods of Garrick, Kean or Irving, Erskine, Hawkins or Russell, were the right methods or the only methods, or even that they were the best methods of practising their several arts; you can only say that they succeeded in their day, and that their contemporaries acclaimed them as masters.

Inasmuch as their methods were often new and startling to their own generation, the young student of acting or advocacy is eager to believe that there are no methods and no technique to learn, and no school in which to graduate. Modern youth is prone to act on the principle that there are no principles, that there is no one from whom it can learn, and nothing to teach. Any one, it seems, can don a wig and gown, and thereby become an advocate. Yet there are principles of advocacy; and if a few generations were to forget to practise these, it would indeed be a lost art. The student of advocacy can draw inspiration and hope from the stored-up experience of his elders. He can trace in the plans and life-charts of the ancients the paths along which they strode, journeying towards Eldorado. True, these figures of forgotten advocates are dim and obscure—only to be painfully seen through the dusty gauzes of forgotten years, pictured for us in drowsy voluminous memoirs, or baldly reported in mouldering law reports; but if we search these records diligently we gradually discern a race of worthy men—see them haunting the old libraries, pacing the ancient halls with their clients, proud of the traditions of their great profession—advocates—advocates all.

It is in an endeavour to recapture something of the lives of these great ones, and the principles upon which they built their success, that I have struggled through forbidding masses of decaying biography in hopes to catch a faint whisper here and there of the triumphant works and days of my professional forebears.

For a race of moderns, that, maybe, care for none of these things, I have lighted again the old lamps which burned so brightly in the days that are gone; which I myself have seen lighting the darkness of our courts, and guiding the footsteps of the judges in the paths of justice and truth. For without a free and honourable race of advocates the world will hear little of the message of justice. Advocacy is the outward and visible appeal for the spiritual gift of justice. The advocate is the priest in the temple of justice, trained in the mysteries of the creed, active in its exercises. For this reason Wyclif in his translation of 1 John ii. 1 sanctifies the word in the text: 'We haue auoket anentis the fadir, Jhesu Crist just.' Modern versions retain 'advocate,' but unhappily substitute 'righteous' for 'just.' Advocacy connotes justice. Upon the altars of justice the advocate must keep his seven lamps clean and burning brightly. In the centre of these must ever be the lamp of honesty.

The English Bar is a society of advocates, though, as Blackstone tells us, we generally call them counsel. The Scots retain the name in their Faculty of Advocates. The word must be insisted upon for its ancientry and meaning. The order of advocates is, in D'Aguesseau's famous phrase, 'as noble as virtue.' Far back in the Capitularies of Charlemagne it was ordained of the profession of advocates 'that nobody should be admitted therein but men mild, pacific, fearing God, and loving justice, upon pain of elimination.' So may it continue, world without end.

From the earliest, Englishmen have understood that advocacy is necessary to justice, and honesty is essential to advocacy. The thirteenth-century *Mirrour of Justices* may, as modern jurists hold, be a contemptible legal compilation. It is said to have been written by one Andrew Horn, a fishmonger; and what could he have known, say the learned ones, about the origin and history of legal affairs? Nevertheless, to the reader of to-day the views of the man in the street, the common citizen of a bygone age, about the place in the world of the advocate is more precious than many black-letter folios of crabbed juridical learning.

'Some there be,' says our fishmonger very shrewdly, 'who know not how to state their causes or to defend them in court, and some who cannot, and therefore are pleaders necessary; so that what plaintiffs and others cannot or know not how to do by themselves they may do by their serjeants, proctors, or friends. Pleaders are serjeants wise in the law of the realm who serve the commonality of the people, stating and defending for hire actions in court for those who have need of them. Every pleader who acts in the business of another should have regard to four things:—First, that he be a person receivable in court, that he be no heretic, nor excommunicate, nor criminal, nor man of religion, nor

* Copyright in U.S.A.

woman, nor ordained clerk above the order of subdeacon, nor beneficed clerk with the cure of souls, nor infant under twenty-one years of age, nor judge in the same cause, nor open leper, nor man attainted of falsification against the law of his office. Secondly, that every pleader is bound by oath that he will not knowingly maintain or defend wrong or falsehood, but will abandon his client immediately that he perceives his wrong-doing. Thirdly, that he will never have recourse to false delays or false witnesses, and never allege, proffer, or consent to any corruption, deceit, lie, or falsified law, but loyally will maintain the right of his client, so that he may not fail through his folly or negligence, nor by default of him, nor by default of any argument that he could urge; and that he will not by blow, contumely, brawl, threat, noise, or villain conduct disturb any judge, party, serjeant, or other in court, nor impede the hearing or the course of justice. Fourthly, there is the salary, concerning which four points must be regarded—the amount of the matter in dispute, the labour of the serjeant, his value as a pleader in respect of his (learning), eloquence, and repute, and lastly the usage of the court.'

Note how from the earliest days the advocate may in no way maintain or defend wrong or falsehood. It is the right of his client he is there to uphold, and the right only. Nevertheless, although an advocate is bound by obligations of honour and probity not to overstate the truth of his client's case, and is forbidden to have recourse to any artifice or subterfuge which may beguile the judge, he is not the judge of the case, and within these limits must use all the knowledge and gifts he possesses to advance his client's claims to justice.

Many good men have been troubled with the thought that advocacy implied a certain want of honesty. Boswell asked Doctor Johnson whether he did not think 'that the practice of the law in some degree hurt the nice feeling of honesty?' To whom the doctor replied: 'Why no, sir, if you act properly. You are not to deceive your clients with false representations of your opinion: you are not to tell lies to a judge.' *Boswell:* 'But what do you think of supporting a cause which you know to be bad?' *Johnson:* 'Sir, you do not know it to be good or bad till the judge determines it. I have said that you are to state facts fairly; so that your thinking, or what you call knowing, a cause to be bad must be from reasoning, must be from your supposing your arguments to be weak and inconclusive. But, sir, that is not enough. An argument which does not convince yourself, may convince the judge to whom you urge it; and if it does convince him, why, then, sir, you are wrong, and he is right. It is his business to judge; and you are not to be confident in your own opinion that a cause is bad, but to say all you can for your client, and then hear the judge's opinion.' *Boswell:* 'But, sir, does not affecting a warmth when you have no warmth, and appearing to be clearly of one opinion when you are in reality of another opinion, does not such dissimulation impair one's honesty? Is there not some danger that a lawyer may put on the same mask in common life, in the intercourse with his friends?' *Johnson:* 'Why no, sir, everybody knows you are paid for affecting warmth for your client; and it is, therefore, properly no dissimulation: the moment you come from the bar you resume your usual behaviour. Sir, a man will no more carry the artifice of the bar into the common intercourse of society, than a man who is paid for tumbling upon his hands will continue to tumble upon his hands when he should walk on his feet.'

I like the rough English common-sense of this; but the Irishman in the dock had an inspired vision of the same truth when, in answer to the Clerk of the Crown, who called upon him with the familiar interrogatory, 'Guilty or Not Guilty?' he replied with a winning smile, 'And how can I tell till I hear the evidence?'

When Lord Brougham, at a dinner to M. Berryer, claimed in his speech that the advocate should reckon everything as subordinate to the interests of his client, Lord Chief-Justice Cockburn, 'feeling that our guest might leave us with a false impression of our ideals,' set forth his views of an advocate's duty, concluding with these memorable words: 'The arm which an advocate wields he ought to use as a warrior, not as an assassin. He ought to uphold the interests of his client *per fas*, and not *per nefas*. He ought to know how to reconcile the interests of his clients with the eternal interests of truth and justice.'

The best advocates of all generations have been devotees of honesty. Abraham Lincoln founded his fame and success in the profession on what some called his 'perverse honesty.' On his first appearance in the Supreme Court of Illinois he addressed the court as follows: 'This is the first case I have ever had in this court, and I have therefore examined it with great care. As the court will perceive by looking at the abstract of the record, the only question in the case is one of authority. I have not been able to find any authority to sustain my side of the case, but I have found several cases directly in point on the other side. I will now give these authorities to the court, and then submit the case.'

There have been advocates who regard such a course as quixotic. The late Joshua Williams was asked whether, if an advocate knows of a decided case in point against him which he has reason to believe is not known to the other side, he is bound to reveal it, and gave it as his opinion that 'in principle this is no part of his duty as an advocate.' It must be remembered

that this opinion was given when a host of cases were decided against their merits on purely technical points of law; but there is no doubt what the practice ought to be, and what among English advocates the practice is.

If an advocate knows the law to be *x*, it is not honest to lead the court to believe that it is *y*. Whether the advocate does this by directly misstating the law, or by deliberately omitting to state it fully within the means of his knowledge, it is equally without excuse, and dims the lamp of honesty.

For the advocate must remember that he is not only the servant of the client, but the friend of the court, and honesty is as essential to true friendship as it is to sound advocacy.

'I M.

By William Burrill.

PART I.

I.

IT was the Jubilee year of '87. On a beautiful morning in August a young man of about seven- or eight-and-twenty was seated in a first-class smoker of the Scottish express. The train was more than usually crowded, owing to a number of children on their way to some festival, and he was at a loss to know why an express train was used for this purpose.

'You see, sir,' explained the guard, 'we 've just got to use everything and anything this year. There 's that many treats going on that we hardly knows how to deal with 'em; but you 're all right, sir—I 'll see you 're left alone.'

'Well,' thought the young man as the guard moved away, 'at least I 've got a compartment to myself, and the train 's due out now, so I 'll make myself comfortable. But—shattered hopes! —here 's the guard coming back. What on earth——'

'Can't be helped, sir; station-master's orders! I 'm very sorry, sir, but I 'll move him at Grantham when the "treat" gets out.' And in he pushed a jovial-looking but anxious man with a huge bag—sailor written all over him.

The train began to move.

'Take care o' my Jinny!' called out the man to the guard, 'an' see an' give 'er them sweets, an' a drink o' watter.'

'All right, Jack, I 'll see to her,' shouted back the guard as he jumped for his van.

'That were a proper "pier-head" jump, an' no mistake. Blast them Board o' Trade fellers keepin' folks awaitin'! They 'd make yer believe it weren't yer own money yer was takin' off of 'em. Dang their eyes! I near missed me passage through 'em!'

The man, having relieved his feelings, now turned to view his surroundings. Catching the young man's eye, he said, 'I 'opes I ain't intrudin' on yer, sir. It weren't my fault as I got shoved in 'ere, where I ain't got no right.'

'Oh, not at all,' said the young man; 'I 'm glad you didn't miss your passage. The next train is a slow one, so, if you are going far, it makes a lot of difference.'

'Newcastle 's where I 'm boun' to, sir, an' it 's a long way for me, seein' as I 'ardly ever goes in a train—plaguy things, I calls 'em. Nothin' like a good stretch o' canvas to move yer about, I says.'

'Seems quite a decent sort,' thought the young man; 'and, thank goodness, he 's quite sober.' Then, looking up at the sailor, he said politely, 'I 'm sorry they didn't let your little girl come in with you.'

'My little girl! I ain't got no little girl, mister. Wot makes yer think that?'

'Why, didn't you tell the guard to look after her? I think you called her Jinny.'

'Why—why, mister,' said the sailor, exploding with laughter, 'that weren't no little girl; it were my pet monkey! I calls 'er Jinny. Yer see, sir, Jinny 's a kind o' family-name wi' lady monkeys; but for yer thinkin' it were a little girl, why, it beats cock-fightin', it do. 'Sides,' he continued, 'I ain't even marrit, an' I 'm turned forty-seven. I don't 'old wi' sailors a-marryin'; but I 've got a sister marrit on a carpenter in Newcastle, an' at time o' the weddin', near sixteen year ago, she says to me, "Jim," she says, "there 's al'ays a 'ome wi' us whenever yer comes 'ome, an' don't yer forget it." An' I don't forget it, mister. I al'ays go to 'em every v'y'ge, instead o' stayin' in them boardin'-'ouses for to be robbed.'

'That 's jolly nice for you,' said the young man, 'to have a nice home to go to after a voyage; and it must be nice for your sister too.'

''Tain't me sister I goes for to see,' said the sailor, though not disparagingly; 'it 's 'er kid—little Nellie. She 's a fair capper, she is—fourteen year old. Uncle Sailor, she al'ays calls me, ever since she was the 'eight o' me knee, she 'as. An' Jinny 's for 'er, she is; I brings 'er all t' way from Calcutta for 'er—ay, I did that!'

On leaving Grantham, where the school-children got out, the sailor was still in his corner, the guard having agreed with the young man that he might as well stay where he was, 'so long as you don't mind, sir.'

'D' ye mind, sir, if I 'as a draw at me gum-

bucket? I begs yer pardin'; I means me pipe. I ain't 'ad a pull sin' breakfast.'

'Not at all; go ahead,' said the young man. 'It 's a smoking-carriage; and, besides, I 'm going to light up, too.'

The two sat smoking in silence for some time.

At last the sailor (or Jim, as he had told the young man to call him) knocked out his pipe, and leaning forward, said, 'Beggin' yer pardin', sir, we 'ad a rotten v'y'ge, we 'ad, comin' 'ome this time.'

'Indeed, Jim? What was it? Short of grub, eh?'

'Naow!' said Jim in disgust. 'Grub! Naow! It were wot these 'ere ink-slinger chaps calls "a mystery o' the deep sea!"'

'Oh, a mystery of the sea, Jim! You might tell me about it. I should like to hear it immensely.'

'Yer shall, sir; an' yer 'll say it 's a mystery right enough when I 've told yer all about it, I 'll bet.'

II.

The young man relit his pipe, and Jim began.

'Yer see, it were this 'ere way, sir. The *'Ighgate 'Ill*——'

'The what?' interrupted the young man.

'The *'Ighgate 'Ill*, sir; that 's the name o' the ship.'

'I 'm so sorry, Jim. I didn't quite catch it—that passing train made such a din. But go ahead, Jim. I 'll not interrupt again.'

'She 's a fine ship, sir, 2071 tons register; an' bein' as 'ow freights was low, we 'd been laid up a matter o' four months in Calcutta. All the 'ands in the fo'c'sle, except me, 'ad been paid off—'relse they 'd 'opped it—so, when we *did* get a cargo for London, the Old Man goes for to sign on a fresh crew. They come aboard at night, twenty-one on 'em; but I goes an' turns in, 'cos yer can't talk to sailors the night they comes aboard. But next morning, thinks I, they 're a likely lot; an' we was soon down to Garden Reach waitin' for a tug an' pilot.

'The Old Man comes aboard about 9 A.M. an' sings out to me, "Jim," 'e says, lookin' mad, "tell all 'ands to lay aft." We all come along quick.

'Then 'e turns round to us an' says, says 'e, "Men, yesterday I signs twenty-one on yer on for the v'y'ge 'ome. This morning the agent tells me that one on yer in that twenty-one is a friend o' his, by name of Mr Tom Hinshlewood, though the agent don't suppose he 'd sign on under 'is own name; but as 'ow he 'd been a-writing about soldiers in India, an' wished for to write about the 'abits o' sailormen, got first-'and, as the sayin' is.

'"Now, men," he says, "I give the agent all about what I think o' him, an' more; but I 've got something else to say, an' that is to all o' you. We 'aven't left Garden Reach yet, an' there 's a dinghy alongside awaiting orders, so, whichever one on you lot is Mr Blooming Tom Hinshlewood, I advise yer right now to give me one step forward, an' *git*, while I 'm in a good temper, an' then I 'll forgive yer on account o' yer bignerance."

'Nobody steps out. The Old Man turned to, an' e' carries on somethin' terrible; in fac', mister, I didn't think any livin' man 'ad so many heppitaffs.

'"Come on," 'e says, lookin' round us all—"come on, yer blasted ink-slinging, scribbling 'ound! I 'll teach yer 'ow to 'itch-me-trousers, an' be good-natured, an' 'ave a wife-in-every-port, an' all the other things you think-you're-clever-ones says about a honest sailorman. I 'll——"

'But just then the mate steps up an' says to 'im, soothin'-like, "Leave 'im to me, sir; I 'll fix 'im when I finds 'im. The swine won't 'ave nothing to write about for to make 'is friends laff at us."

'Just then the pilot an' 'is leadsman come aboard; they give the Old Man one or two letters as they 'd brought with 'em, but 'e just puts 'em away in 'is pocket, an' goes into 'is cabin, a-bangin' the door.

'We all drifts away for'ard, an' most on us goes into the fo'c'sle for a draw o' 'bacca; but when we gets there, it were like a dumb 'ouse. Nobody says a word, 'an we sits there a long time, till I gets fidgits on me. So I says, speakin' to nobody like, "Silence may be golden—as the sayin' is—but I thinks it 's bloomin' unsociable, so to speak."

'Wi' that, one on 'em—Bill 'Arding 'is name was—says to me, 'e says, "Ho! do yer?" says 'e. "I suppose *you* might be Mr Tom Tinkle-wood, or wotever 'is cognostic may be."

'"An' 'ow could that be," says I, "seein' as I were in this 'ooker on the v'y'ge out, which you wasn't, Mr Smarty, nor none o' t' others wasn't neither?"

'Yer see, mister, that little fac' made it all right for *me*, but all t' others was suspicioned on each other.

'They begin in a day or two, listenin' an' wot not, for to find out 'oo was 'im, but it weren't no good; every day gets worsner an' worsner of that suspicionedness they 'ad on each other.

'One day Bill 'Arding 'e washes 'is face, an' we made sure 'e was 'im—I did, any'ow—an' I says to 'im, says I, "So you 're 'im, are yer, me little bit o' perfume?"

'"'Ere," 'e says to me, "if yer says I 'm 'im again, yer 'll get my sea-boot across yer lug—big as yer are!"

'"Well," says I, "if yer not 'im, I 'm pleased to meet yer, for I ain't really seen yer afore yer 'ad yer face washed."

'We got a bit friendly-like after this, did Bill an' me, but I never could get over me doubts on 'im altogether.

'Another day I says to Bill, "Bill," says I,

"seein' as 'ow we can't trace 'oo's 'im, I'm a-tryin' 'ard not for to do anythin' as 'e can write about us to the papers, so to speak."

'"Jim," says 'e, "that's *just* what I washed me face for, an' I've stopped chewin' an' swearin', an' I'm al'ays sayin' 'ow delicious the pea-soup an' pork is, an' 'ow thoughtful of the stooard to give us pork an' pea-soup for a change like; but it ain't no good, Jim—they're *all* doin' it now. Why, I knows for a fac' Charlie Summers 'as cleaned 'is plate an' washed 'is punnikin twice this week, for I see 'im a-doin' of it; an', besides, they all washes their faces every day now; an' there was 'Chips' makin' up 'is bunk to-day, just like a bed in a boardin'-'ouse. If we goes on like this," 'e says, "we'll all go looney."

'"What was wrong in t' middle watch last night, Bill?" says I.

'"I'll tell yer," says 'e. "We'd just reefed t' fore-tops'l an' was goin' for to 'oist up again, an' nobody wouldn't start a 'chanty,' 'cos they didn't want 'im to 'ear a real one. So, because we couldn't pull together without one, one of the 'prentices starts a 'ymn called 'Pull for the Shore.' We only knowed the first line, so we went at it, 'Pull for the shore, pull for the shore.' Then all of a sudden a voice says out loud, '"Ow beautiful the 'uman voices mingle with the raging billows!' By gum, Jim!" says Bill, "we thought we 'ad 'im. Everybody let go the 'alliards, an' we 'urls ourselves, brave-like, to where the voice come from. But there was only the mate there, a-clearin' the buntlines. An' 'e said 'e 'adn't 'eard nothin'; an' then 'e starts a-carryin' on at us for lettin' go the 'alliards—said we'd sprung the tops'l yard."'

III.

'Well, mister,' continued Jim, 'we goes on like this 'ere till we're close 'ome. Sometimes we'd talk a bit to one another, if there wasn't nobody about; then next day, maybe, we'd kind o' nod, but don't speak.

'All the time we was improvin' our manners; we would rush to do little acts o' kindnesses for one another. Why, Charlie Summers wanted to take my eight to ten wheel for me 'cos I had the toothache one night. But I see it were comin' on to blow soon, an' we'd likely be at the braces gettin' wet, all the first watch, so I says, "Thank yer kindly, Charlie; yer've a 'eart full o' sympathy, but I think I'll be more comfortable at the wheel."

'"Just as yer like," says Charlie, a bit lofty. "*Some* folks would be glad of a hact o' self-denial to come their way."

'Then they all gets a-talkin' 'igh-toned; some on 'em made out they was relations to swells wi' lots o' money an' a country seat. But Bill 'Arding took the bit o' 'ard tack when 'e try to tell us 'e was a relation, by 'is mother, to a barrownite.

'I couldn't stand this, so I ups an' I says, "Bill," says I, "I al'ays thought yer folks was costers, an' now yer've said so yerself." 'E was proper narked wi' me for givin' of 'im away, but I smoothed 'im over when I tells 'im as *real* toffs never speaks about their relations, in case o' them not likin' it spread about.

'Well, mister, the old 'ooker's shovin' the watter along about eight knots, wi' a nice wind on the port quarter. It bein' summer-time an' us gettin' near to t' Channel, the Old Man tells us to get our duds out on deck, so as to give t' fo'c'sle a paint out—a Channel cleanin', so to speak. So we takes everythin' out, an' puts our beds near our chests on deck.

'We sees the square-'eaded stooard a-turnin' out the cabin, so we slacks up di-ci-pline, as is usual. That night were pretty dark. We was all sittin' about the fore 'atch a-smokin' an' wot not, when Bill 'Arding come runnin' for'ard. 'E were a-tremblin' all over; an' when 'e gets 'is breath, 'e says, "Mates," 'e says, "I've seed 'Im!"

'"'Oo?" we all says.

'"'Im! 'Im! 'Im!" says Bill, excited-like. "I seed 'im a-skulkin' round the mizzen, as I were a-comin' from t' wheel; 'e's a-crouchin' by t' mast ready for a spring!"

'"Go hon, Bill," says Charlie Summers; "it must 'a been t' mate a-playin' pee'-bo wi' yer."

'"No, it weren't t' mate," says Bill, scornful. "*I knows.*"

'"Come on, mates," says I; "p'r'aps it *is* 'im. P'r'aps 'e's been a-stowed away all t' v'y'ge; an' now we'll cop 'im."

'We sees as we've got our sheath-knives 'andy, an' Bill 'e gets a belayin'-pin as well. Then we makes a move for aft, all goin' cautious-like. We lets Bill go first, 'cos 'e see 'im first; an', besides, 'e 'ad a belayin'-pin as well as 'is knife.

'It took us maybe a full twenty minutes to get aft—yer see, mister, we was frightened o' being ambushcaded, so we goes from one part to another, keepin' in the shadow of t' sails an' ropes, or along t' scuppers. We was near let down once. Charlie kicked 'is toe agen a ring-bolt, an' said, "'Ell!" so loud that we thought our game were up; but t' sound couldn't 'a reached 'im, or 'e were playin' possum.

'At last Bill, 'oo was still in front, stoops down an' 'e whispers to me, "There 'e is, Jim. Come a bit closer an' look—'e's stoopin' down." I seed 'im right enough, an' I gets full o' excitement, but I whispers to Bill, "If I comes any nearer, mate, yer won't be free for to fight. You go in, Bill—we'll back yer up."

'Bill goes 'alf a step further, a-stoopin' low, an' then 'e raises 'is arm for to aim a blow—an' just at t' same time t' other feller does t' same. I see 'is arm up, an' thinks I to meself, 'e'll get 'is in first; so quick-like I yells, "'It 'im, Bill! 'It 'im, quick!"

'Bill lets drive a proper knock-out with 'is belayin'-pin. There was a *'ell* of a crash! We all rushed in, determined-like, to 'elp Bill, 'oo was lyin' on deck, an' we gets on top o' one another, full o' excitement.

'Some one sings out, "Look out, mates; 'e 's got a knife!"

'But my time come. I gets 'im by t' throat —'e couldn't speak nor shout, 'cos me 'ands was grippin' 'im too 'ard. Then all of a sudden me 'ands slips, an' I feels 'im bite me thumb— 'orribly 'ard. It made me fair sick wi' pain. I gives a look close at 'im lyin' there, breathin' 'ard, an' wot d' yer think, mister? It were Charlie Summers! I 'd got 'im by mistake in the dark.'

'Great Scott!' said the young man, bursting out laughing; 'what a thumping lark! Jim, how——'

'There weren't no thumpin' *larks* about it at all, mister,' said Jim severely, 'an' yer 'd 'a said so if yer 'd been there, yer would. Yer should 'a 'eard wot Charlie Summers 'ad to say to me about it, an' all. But there, mister, I wouldn't pain yer wi' repeatin' 'is blasfumous landgwige.'

'I 'm very sorry, Jim,' said the young man; 'I was really laughing at my thoughts. Your description is so clear that I almost felt as if I had been there myself. Charlie Summers must have felt an awful ass.'

'Maybe 'e did,' said Jim, his bristles smoothing down—'maybe 'e did, but yer can bet yer bottom dollar yer can feel lucky yer wasn't there, any'ow. Well, to get back to where we was, sir. Just as we was all a-lyin' there, like a tin o' fishin' worms, out rushes the Old Man an' the rest o' the afterguard wi' a 'urricane-lamp. We picks ourselves up slow, an' when we gets t' lamp out on our eyes, we sees in front of us, all broke in little pieces, the beautiful big lookin'-glass wot stands on t' cabin mantelpiece. T' Old Man see it too. 'E starts a-callin' us. Gosh! but 'e *did* call us—for all 'e was worth. 'E give us all pedigrees back from Jonah to Noah, an' 'is landgwige was . . .!

'"Get for'ard, yer set o' danged loonatics!" 'e says—"get for'ard! I 'll see ye 're put in a 'Foolish 'ouse' for this when we gets 'ome— that 's where ye 're fit for. Sailors, yer calls yerselves! Sailors! It 's mad, blooming madmen yer are!"

'We goes for'ard, very mournful, but glad to go so as to get away from t' Old Man's clangin' tongue—it were wors'ner t' tongue o' a cracked fire-bell. Some on 'em starts for to wash t' blood off their 'ands, an' some lights up for a draw, but all pertends they didn't know one another. An' there we was, mister, all unfriends again, same as before. It were 'opeless. Yes! bloomin' well 'opeless,' said Jim.

(*Continued on page 25.*)

CONCERNING DUELS.

By W. H. Williamson.

I.

ONE wonders whether those people who lightly fling out challenges to duels wish to re-establish the bad old duelling days, when the bully had so fine a chance, if only he were a deadly shot or had the approved wrist. The history of duelling reeks with grief and stupidity. What sane thing did a duel ever settle satisfactorily?

Over a hundred years ago men in these islands had discovered the folly of the duel. Alexander Campbell was tried at the Armagh assizes in 1808 for the murder of Captain Boyd of the 21st Regiment. Boyd was killed in a duel. Apparently the only sort of defence set up related to the prisoner's character. He was 'a humane man, and generally behaved properly'! His witnesses included army men: two generals, two colonels, and two captains. And the charge was murder. It reminds one of the defence set up for a recent ruffian that he was kind to his mother!

But the judge said plainly that by the law of this country the illegal killing of a man must fall within one of three sorts—homicide, manslaughter, or murder. A duel was wilful; there was no chance-medley, self-defence, or anything of that kind in a duel. The two antagonists blazed at each other with pistols. The judge disposed of manslaughter and homicide, and the jury found Alexander Campbell guilty of murder.

The provocation in this case was in this short altercation:

'Do you say I am wrong?'

'Yes, I do.'

It seems pretty petty for a death sentence on both the speakers, yet Captain Boyd was killed and Major Alexander Campbell was hanged! Surely a humiliating reflection on the commonsense of human beings.

John Stanley, a young rogue, who was early taught by his father to fight duels (and ended his days at the age of twenty-five on the scaffold), had at least one queer experience. He quarrelled with a certain Captain Chickley at a cider-cellar in Covent Garden, and promptly challenged the captain to fight in a dark room. This is reminiscent of the old story, which was clearly founded on fact. But apparently in this instance friends sent for a constable, and the door of the dark

room was broken open, to the probable temporary salvation of John Stanley, for Chickley had already run his sword through him once, and only received two insignificant wounds himself.

Again, one wonders, where was the advantage of this duel?

In 1782 a clergyman was indicted at the Old Bailey for 'the wilful murder of Lloyd Dulany in a duel.' The two men had quarrelled, and it seems the clergyman must really have forgotten his calling to want to decide a difference with a fellow-man with pistols. But he took the affair seriously, for one witness affirmed that she saw 'the prisoner Allen shooting at a mark in a field near Blackfriars Bridge, with pistols, between eleven and twelve on the morning of the duel!' So there seemed sincerity in his desire to kill. But 'in a field near Blackfriars Bridge' is a phrase to be seized on with some imagination nowadays! Allen was found guilty of manslaughter; though why he was not as guilty as Major Campbell, one fails to see. *Tot homines, tot sententiæ*—'Different juries, different verdicts.' Or did the judges count for so much more? Mr Allen's judge was the Recorder, and he made, it is reported, 'a pathetic speech, and fined the reverend delinquent one shilling and sentenced him to six months in Newgate.' It does not seem excessive!

II.

In France they have their niceties in these matters. Aimé Sirey, though boasting himself a famous fighter, had scruples. His vanity was colossal, and so he fought with M. Durepaire in gloves and a mask; he could not bear to think his good looks might be spoiled. Durepaire had suggested that only one pistol should be loaded, and they should face each other valiantly. But where was skill if that sort of thing prevailed? Sirey refused, and, after publicly insulting Durepaire, killed him with his sabre. A trial resulted—this was in 1837—but Sirey, needless to say, was acquitted. This was France, not England.

Aimé Sirey, having taken to the sword, perished by it. He had a quarrel with a lawyer, called Caumartin, respecting a lady. The lawyer drew his sword-stick and sheathed it in Sirey, who had snatched a knife from the table. Caumartin was also charged, and acquitted.

Edouard de Mercy was another of those violent people who seem to think that differences of views can be settled, and pricks to one's vanity assuaged, only by a fight to death. De Mercy had this remark flung at him: 'Then you haven't read the books of Jules Gérard?' It doesn't sound very humiliating; but De Mercy thought blood was the only way to wash out the stain; and he did it with trickery. He made friends with Rozier, who had spoken of Jules Gérard's works, and then persuaded him to come to his room.

He said it was a duel. Perhaps this goes outside the duel proper, for there were no witnesses, and De Mercy was condemned to death. He was reprieved, but imprisoned. A duel without witnesses is plain murder.

A duel between M. de Beauvallon and M. Dujarier had a sequel that flung into light one of the rules that should be observed by those who think to kill with coolness. These two men had quarrelled, and a duel was the only outcome, so far as custom, with its imbecilities, could suggest; though M. Dujarier said to Alexandre Dumas, 'I don't know why I am going to fight'—which seems almost the appropriate atmosphere for the sorry business.

This was a devilish affair. One of the seconds put his finger in the barrel of a pistol, and saw it was smoky. 'Has the pistol been tried?'

'Not at all—merely an empty cartridge,' replied Beauvallon's second.

The antagonists faced each other, and Dujarier fired; he was a child with a pistol in his hand. Beauvallon held his fire. He took steady aim, while the others waited. He fired. Dujarier fell. They carried him home, and his corpse was met at the door by Lola Montez, his friend.

III.

Tongues wagged. The duel did not seem fair. Dujarier was no duellist; Beauvallon was. And the quarrel was about nothing. And even that faded into another question. It was said that Beauvallon had actually fired before with the pistols used in the duel—a fact fatal to fairness. On this issue Beauvallon was tried for the murder of Dujarier.

In the course of the trial some of the rules of duelling were cited. This is from the evidence given by Alexandre Dumas, who was one of the witnesses. He had been asked about the reply brought by the seconds. 'That is always done,' he said, 'and frequently happens when one risks one's life. The witnesses can make concessions that the principals cannot. They speak for you; they are godfathers, taking care of your life and your honour. Discussion between witnesses is easy; they don't quarrel; they must not get angry. The real adversaries would make the duel inevitable; the seconds can make it avoidable. It is all in the duelling code, signed by M. de Châteauvillard and by all the leading names in literature and nobility.'

'According to this code, is it loyal to provoke a man to a duel with a sword if the man doesn't know how to handle that weapon?'

M. Dumas replied, 'You never know the strength of your opponent. That is so true that many people practise secretly, so that no one shall know how skilled with a weapon they are.'

'That doesn't sound very fair.'

'In a duel, questions of generosity and delicacy are lost in the bigger question of self-existence.' So Alexandre Dumas!

The presiding judge added: 'The duelling

code won't find a place in my library.' He seems to have been able to keep a clear head.

The cullers of literary curiosities may like this final exquisite phrase from Alexandre Dumas *père*—it is significant: 'May I be permitted to return to Paris—*where they are playing a five-act piece of mine!*'

Beauvallon was found guilty of having practised with the pistols used in the duel, and was, in consequence, sent to prison for eight years.

This question of seconds was raised in the unfortunate Mayer–De Morès duel in France in 1892. The Marquis de Morès, a furious anti-Semite, acted as second for M. de Lamise in a duel fought between him and Captain Cremieu-Foa. Captain Mayer acted similarly for Captain Cremieu-Foa. The latter reproached his seconds for the terms agreed on, and his brother, who was with him, seeing the *procès-verbal* on the table, took a copy of it. Captain Mayer said it was not to be published, the seconds having agreed to that.

M. Ernest Cremieu-Foa met some pressmen, and, regardless of Captain Mayer's warning, gave the account to them. The Marquis de Morès seized the opportunity of telling another Jew that he had broken his word, and that blood was the only way to blot out the deed.

Captain Mayer said he had nothing to do with the indiscretion. But that did not matter. M. de Morès would have his duel, and Captain Mayer, who seemingly had done nothing to which any reasonable man could take exception, was killed. And in France some think that sane!

To emphasise the importance of the rôle of the seconds, it was pointed out in the Dupuis–Habert duel in 1888 that the seconds there seemed determined to have no agreement, no reconciliation. Particularly was this alleged of the seconds of M. Dupuis. In the subsequent trial (M. Dupuis was killed) the judge blamed the seconds for letting their principals fire with weapons of an excellent precision (!), and with having put the duellists in an alley of trees, which made aiming easier. In this case the seconds were altogether blamed. It seemed to be proper for the seconds to see that all 'accidents' should be sedulously avoided. Then, why fight?

IV.

An extraordinary incident was noted in the Drumont–Mayer duel in 1886. It was the outcome of Drumont's Jew-baiting. According to the *procès-verbal*, M. Meyer, the manager of the *Gaulois*, attacked his adversary so desperately that they were almost touching each other, and in the heat of the struggle Meyer caught hold of Drumont's sword with his left hand. The seconds intervened, and when the combat was resumed the scene was actually repeated, nature, apparently, having a pull over duellists and their codes.

This use of the left hand in a duel is, of course, forbidden; but there was a question of the interference of the seconds when their principals were fighting, as one suggested, not as men, 'but as beasts!' Duels have more than their foolish and sad sides; they can be brutal! M. Meyer was absolved in this case.

The Chapuis–Dekeirel affair shows the duel in its foolish beginning to its tragic end. The scene was Dunkerque; time, evening. A café, the lights lit, tables dotted about, with all sorts and conditions of people seated at them. A jovial officer talks to a lady. A sensitive gentleman tells him he does not know how to behave. The officer replies, roundaboutly, that he does on the field of honour!

M. Chapuis, lieutenant in the 110th, and M. Eugène Dekeirel were the two duellists. M. Chapuis said he would kill M. Dekeirel; he was sure of it—absolutely sure of it. M. Dekeirel perhaps wondered what was going to happen. The duel took place. In the midst of it M. Dekeirel used his left arm to divert the lieutenant's sword, and with his own he thrust and killed. It was the left-arm business that disturbed the whole duelling world of France. Paul de Cassagnac was dragged in. He said simply, if the left hand were used to divert an opposite sword, even if done involuntarily, and if during that time the one using his left arm struck with his own sword, it was not a duel, but an assassination.

There were left-handers and anti-left-handers. Some would not listen if you moved your left hand while fighting; others said that the Italian school, the mother-school of fencing, taught the showing and moving of the left hand.

But no argument could bring back to life the dead Lieutenant Chapuis, which seems the one fact worth considering. M. Dekeirel was acquitted by the jury, with only his conscience to accuse or comfort him.

FOAM.

On the breast of the river,
Weird, mystic, and wan,
With white plumes a-quiver
There floats a white swan.

She seeks not green grasses
Nor reed-beds for rest;
No foot as it passes
Shall chance on her nest.

The dawn with his roses
Brings red to her wings,
And day when it closes
New blush to them brings.

The wild-fowl go feeding
Both early and late;
She sits there unheeding,
She calls to no mate.

She waiteth for no bird
Beneath the blue dome,
This lone swan, this snowbird—
The blown river-foam.

WILL H. OGILVIE.

LES EXTRÊMES SE TOUCHENT.

I.

THE harsh wind blowing up the narrow streets and alleyways of Damascus (called, according to locality, a *harmattan* in West Africa, a *haboob* in the Sudan, and a *khamseen* in Egypt)—bringing with it a reminder of the limitless and far-stretching desert outside in the shape of innumerable fine particles of sand that dusted the faces of the passers-by and percolated the inmost recesses of their clothing, bestrewing even the floors and tables of closed houses with a filmy, though gritty, deposit—was doing considerably more damage than ruffling the surface of the sand over which it passed; it was ruffling (and badly at that) the temper of Herr Oberleutnant Hans, Freiherr von und zu Freiberg-Eisenberg-Allmendingen, and his brother-officers of the Ost-Asien Korps,* as they passed to and fro on their lawful occasions. Incidentally, it was ruffling the tempers of the men of that celebrated unit as well, but they did not count.

'*Verflucht! Donnerwetter noch einmal*,' spluttered the Oberleutnant in his best Prussian manner, with a nasal whine, as he elbowed a couple of veiled native women off the narrow footway. 'Was it for this that I left the beautiful city of Berlin? To leave Germany at all was bad enough; but to quit it for such a God-forsaken country, where, even when one is out of the line, a little comfort is unattainable, is beyond all words! *Pfui, Teufel, was für eine Luft!* [Damn it, what an atmosphere!],' as, whilst trying to shield his eyes from the blast, he cannoned into a laden donkey lurching down the narrow street.

The donkey took the ensuing buffet as he took the sandy wind—with a resignation, the fine flower of which comes to fruition only in the East; whilst his Beduin driver, pacing stolidly behind him, bare feet padding noiselessly in the roadway, and muffled in his coarse, dingy-brown camel's-hair cloak, swathed, all but his eyes, in a fold of his turban to keep the sand out of his nose and mouth, showed an adaptability to climatic conditions that the German might well have copied, and a shrewd appraisement of his country's 'Allies,' as he slipped without effort to the side of his beast to avoid contact with the German's walking-stick.

'We ought to have a veil of some sort for this pestilential country, too,' soliloquised the Oberleutnant as he passed on. 'A gas-mask is too thick and hot for this sort of thing. *Ach, Gott sei Dank*, here's the Offiziers-Casino,' as a squat, two-storeyed building hove in sight. '*Jetzt trink ich schnell ein Glas Bier und dann wird's mir allenfalls besser gehen!*' ('I'll have a glass of beer at once and unquestionably feel the better for it!'), as he clattered up the steps.

'*Salaam alaike, ya sidi; el zabit ferangi darablak?*' ('Peace be to you, O sir; did the foreign officer strike you?') called an itinerant street-vender to the Beduin as he got to the corner of the narrow lane, for it was little more.

'And peace be to you, O my brother,' the Beduin replied. 'Thanks be to Allah, no, for I guessed what might happen, and quickly stepped aside. But are the *ferangi* [foreigners] all like that—of a red face and a hasty temper?'

'It is well for you, brother, that you live in the Sahara [desert], for there they be but few; but here in Damascus they are as grains of sand, and in Haleb [Aleppo] likewise. Rumour has it that they will win this war against the English *Nuzrani* [Christians], and what will then happen to this land Allah knows, for already they bear themselves as conquerors!'

'*Sahihya*' ('True indeed'), replied the Beduin, leaning easily on his staff. 'It were better, indeed, that the English should win, for they at least are no enemies to Islam, so men say.'

'That is as may be,' was the indifferent response; 'but, for my part, I hate all unbelievers. May the time soon come when Islam reigns supreme on earth!' and doubling up his little trestles, he raised his heavy basket of foods and went his way, chanting in a curiously unmusical voice his everlasting refrain of '*Lahme kabob, salata!*' ('Meat kabobs and salad!'), till the sound was lost in the distance.

The Beduin, in the listless, apathetic manner of the East, seemed to have but little to do, or at least to be no slave to time, for, squatting down upon his haunches, he huddled up against the wall, and drew from under his girdle a flat brown cake of Arab bread, which he proceeded to break and munch with appetite.

'Dry fare, my brother,' hailed an old beggar squatting in an angle of the wall a few yards away. '*Mafeesh marabba wala haga tani?*' ('Have you no jam or anything?')

'*Mabsut kida*' ('I am satisfied thus'), was the dour reply.

'These be hard days,' wailed the beggar in his best professional tone, rearranging his rags afresh so as to show to the greatest advantage his withered and suppurating legs, his nauseating and chief stock-in-trade. 'Formerly I made a living here with but little trouble; now, thanks to the war and these accursed Germans, none have money for alms, food is lacking, and such as I starve!'

'There be many Germans in the city,' re-

* A *corps d'élite* specially raised by Germany for service in Turkey and the Near East.

marked the Beduin casually, chewing his bread, and cocking an eye at his patient ass.

'That is indeed true,' grumbled the beggar. '*Kulla yom fi atr min Stamboul jil mahatta* [Every day trains arrive in the station from Constantinople], and after a short delay they march down the street like great herds of camels, and the motor-lorries follow after, carrying their luggage, and lowing like *gamasi* [water-buffaloes]. This morning, after the troops came out, I counted twenty lorries, piled high with luggage, and men sitting atop. *Kan Nemsawi ben hom* [There were Austrians amongst them],' he added eagerly, quite forgetting his beggar's whine in the interest of his subject.

'What is an Austrian?' queried the Beduin idly, as he stretched his legs to their full extent.

'A kind of German,' was the contemptuous reply. 'He speaks Arabic, but not with their tongue, wears a different head-dress, and is not so cruel as the true German. For example, an Austrian would not have sought to strike you a short while since, as did the German officer. They are of the *tobgiya* [artillery], which the Germans do not understand,' said the beggar.

'*Min yeraf?*' ('Who knows?'), answered the Beduin disinterestedly, rising to depart.

'I know, I who speak. Think you I sit here day by day, calling on the name of Allah, and seeking alms from the faithful, and that these eyes cannot read what they behold? I tell you I know the *Nemsawi* well. They speak our tongue differently from the Germans, their head-dress is different; and as for the *tobgiya*, full many times of late have I seen them come out of this self-same station with the *Nemsawi*, and never yet with the Germans.'

'When was the last time, O Father of Lies?' mocked the Beduin, clouting his ass on the rump to make it move.

'But three nights since, the night of the day when they hanged the English spy, who still hangs yonder,' shrilled the beggar, 'when four great guns moved with *automobil* [tractors] came forth, followed by boxes in which they carry their *taiyara* [aeroplanes], and vanished in the darkness. *Ana mush magnun!* [I am no fool!]' he flung as a final taunt at the departing figure, disappearing as leisurely as it had come.

II.

By this time the first violence of the *khamseen* was abating, and as he stalked solemnly along the Beduin encountered increasing difficulty in forcing a path for himself and his ass through the press, shops, houses, and alleyways all belching forth their crowd of humanity 'to eat the breeze,' as the native proverb puts it, after the sweltering and turgid atmosphere created by the sand-storm. Veiled women, hooded to the eyes, black browbands sheeted round their temples, and a gilded nose-guard further hiding their features, glided sinuously along, balancing on their heads pitchers of water—reminiscent of a picture in some old Bible come to life; turbaned sheikhs, some with the green patch that denotes a successful pilgrimage to Mecca, seated on donkeys or on camels stalking superciliously in the throng; gutter-snipes galore—kin the whole world over—playing in the busiest crowd, a nuisance to every wayfarer, or holding out an impudent palm with the demand, '*Hat backhsheesh*' ('Give me a tip'); blind men innumerable, with staff and wallet; water-sellers, skin-bag on shoulder, making known their presence with a pair of rough cymbals, and required by the law of the Prophet to give drink free of cost to all, infidel and true believer alike, who may ask it at their hands, moved to and fro; and every now and again the crowd parted to give place to some Turkish *effendi* or lesser light, fat and lethargic, as he lolled, smoking the everlasting cigarette, in a shabby victoria, horsed by a pair of scarecrows, whose driver plied his whip impartially on them and on the passers-by in his efforts to cleave a passage, while his tongue was never still, volleying forth, now a shout of '*Iwa riglen*' ('Mind your legs'), now a scream of '*Yeminak*' ('Look out on your right'), or '*Shemalak*' ('Look out on your left').

The small shop-fronts were open, showing craftsmen of various trades at work within—here the brass bazaar, there the leather-workers, and farther on the tailors, interspersed every now and again with small native cafés—miserable affairs many of them, with earthen floors and a mud bench running round the wall, while a fireplace at the side held the charcoal that provided the heat for boiling up the coffee and lighting the *tchibouques*. Over all brooded the hot sun and dust, and the indescribable smell that arises from sweating native humanity in the mass. Into one of these cafés the Beduin turned (his donkey automatically stopping as the stimulus of the goad ceased), and, sinking heavily on the bench, clapped his hands, the universal summons of the East, and shouted, '*Hat ahwa*' ('Bring coffee').

'Great news,' remarked the owner of the establishment sardonically as he poured the coffee from the little copper heating-jug into the tiny bowl; 'the Germans now offer us money uncountable for naught!'

'How so?' inquired the Beduin. 'It was but a short while since that a beggar-man lamented in my hearing there was neither food nor money for the faithful since the Germans brought war.'

'Know, then,' replied the other, 'that Falkenhayn Pacha (the German) and Fevzi Pacha have caused a notice to be sent through the city that persons are seeking to destroy the *sikkat el haddid* [the railway], and whosoever shall give warning thereof to the German or the Turkish Headquarters shall receive the sum of twenty pounds in gold. Indeed, it is affirmed that explosive material belonging to the English has already been discovered at Afule.'

'Without doubt a lie,' chimed in a portly, gray-bearded Turk on the opposite bench, as he pushed up his *tarboosh* to wipe his brow. 'And even were it so, think you that you or I or any man would receive the reward did we find the explosive and give information? Surely not, my brothers, for we should forthwith be accused of placing it to secure the gold, and all we should reap would be the *kurbaj* [whip].'

'What is this talk of explosives at Afule?' inquired a barefooted sweetmeat-seller who had entered during the conversation, his dirty *galabieh* sticky with the sugar melting on his tray.

'*Wallahi, ana marafsh!*' ('By Allah, I know not!') grumbled the Beduin, finding himself directly addressed.

'I know,' remarked a greasy-looking ruffian, half-hidden in the angle by the fireplace. 'I am an *artashgi* [fireman] on the railway, and two nights since, as we approached Afule station with a heavy load, part soldiers, but chiefly goods and stores, we were stopped outside by the danger-light, and could not proceed. So long did we stop that my driver, knowing the engine to be old and the head of steam difficult to maintain, got down to see what was the trouble; whereupon a son of a dog of a German sergeant—*yinal abu-u*! [may his father be accursed!]—drove him back to his engine with many blows, saying he should never have descended; and he, being enraged, upon his return beat me, for that the steam-gauge had dropped low, and when the signal-arm was raised we could not proceed. But what can one do,' he asked, looking round upon the small group of listeners, who murmured sympathetically, 'with wood to fire an engine instead of coal? Before the war we used coal without stint; now there is no more coal—so men say—and we must draw the same loads with green wood and a worn-out engine. *Inshallah el harb illa shuwaya khallas!* [I hope the war is nearly over!]'

'*Inshallah*' ('Let us hope so'), came the deep-toned response from his hearers.

III.

Further conversation was interrupted by the rising sound of a fracas out-of-doors, in which the onlookers, though many in number, seemed little disposed to interfere.

As in most *real* Eastern cities uncorrupted by a grafted European architecture, the house of the better-class native stands cheek by jowl with that of the poor man, and to this haphazard method of town-planning Damascus is, or was, no exception.

It occasioned, therefore, no surprise that nearly opposite the café a Turkish sentry was posted, who, lounging negligently in front of the gateway, exchanging the news of the day with such of the passers-by as tickled his fancy, represented in his person the pomp of military power in the shape of the 3rd Turkish Army Corps Head-quarters. Along the road, filled with *mastic*,* and ripe for any mischief, shouldering aside all and sundry, had come a German Unteroffizier and two or three lusty privates of the *Kraftfahrwagentruppen* (Mechanical Transport Corps), and on espying the sentry, nothing had seemed more apposite to their elephantine German sense of humour than baiting him.

From words they had proceeded to blows, and were, in fact, in the act of pummelling the unfortunate man when the remainder of the Turkish armed guard turned out to the relief of their comrade in distress. In less time than it takes to relate it the street was in an uproar, as the crowd, now fully assured of support, joined in; and at the moment that His Excellency Abdul Karim Pacha, the corps commander, awakened from his afternoon nap, and justly incensed, appeared at his window to ascertain the cause of the brawl, the little café too emptied itself into the *mêlée*.

The Beduin thrust his bony shoulder into the surging mass, and forced his way forward with a volley of low abuse to where he espied his ass pinned against a low doorway. Pushing it before him as an effective battering-ram, he shouldered and beat a path out in time to avoid a Turkish patrol hurrying up to restore order in the customary Turkish way, and, turning to glance behind him, found himself followed by the sweetmeat-hawker, who, too, seemed to have no great stomach for the fray.

'By Allah! but I fear,' he remarked as the hawker overtook him. 'I like not these disturbances when I am separated, as now, from my *bunduquia* [rifle].' Then, glancing round once more, and finding himself well out of earshot, the 'Beduin' continued in perfect English, 'I've confirmed what you've heard about the German heavy guns,' and proceeded to give a full account of his conversation with the beggar. 'And now, Williams, I think I'd better arrange to trek home again. Did you discover anything about the cattle convoy going up to the front?'

'Yes; it's all right, Jerry,' replied the pseudo-hawker. 'I've spent the morning knocking about amongst the butchers, and there's a big head of cattle trekking south to-night. Mahmud el Sayyad, who used to be a fisherman at Jaffa, is going as head drover, as he wants to get back near the coast and slip across. There are two other men, whose names I don't know, going too, and the whole outfit's under the charge of a German *Wachtmeister* [sergeant] of the Supply Department. The beggar's frightfully keen to get back here, as he has some low intrigue on, so he'll hustle you along all right. We'd better go and see Mahmud now; he'll be only too glad to take on another drover. When you get near the line, you'll be able to shift for yourself, won't you?'

'Rather!' replied Jerry Stanley confidently. 'I've got quite a good gadget. See here!' and he

* A native liqueur.

produced from under his cloak a wad of printed fly-sheets.

'What are they?' inquired Williams curiously.

'Propaganda documents—printed in Gurkhali for the Gurkha troops, and in Hindustani for the rest—recommending them to desert, and telling them what a high old time they 'll have with the Turks. Pretty thorough, isn't it?'

'I suppose it 's a Hun Intelligence effort, isn't it? The attention to detail shows that.'

'I suppose so. They hate the Gurkha; they say he 's so stupidly loyal.'

'What are you going to do with them?'

For answer, Stanley dipped once more into the folds of his voluminous gown and fished up a lemon and, still groping, a bit of pointed stick. Digging the stick into the lemon, he turned to Williams once more. 'Now give me again all the data we went through yesterday, and I 'll chalk them down in my notebook.' He waved the top fly-sheet as he spoke, and quickly, though methodically, the details of a concentration for a supreme effort, that meant so much to the Germans, and even more to the British Intelligence Service, were jotted down between the lines of abuse and incitement to mutiny and desertion.

'Right! Meet me at the café again in two hours' time, while I go and dig out old Mahmud el Sayyad.'

Making his way back into the throng, which was now subsiding, humming like a beehive, Stanley effected his mission without much trouble, and, after meeting Williams once more, reported himself in fluent Arabic at the cattle-pen to a short-haired, squint-eyed German sergeant, who, whip in hand, was stimulating the drovers to cut out his cattle, as his orders were to start at dusk.

IV.

At length they started. The first night's march was nothing less than a nightmare.

The squint-eyed sergeant, on a fiery little Syrian gray much too good for him, which he bestrode like John Gilpin of sainted memory, was everywhere but where he wanted to be, and harried drovers and cattle to such an extent that when day broke all were exhausted—a point the German had the sense to perceive.

Camping by day, they moved on again at dusk to avoid the sun, and their eyes were thus spared the arid bleakness of the stony wastes over which they passed. The cattle, no longer harried, moved on as cattle should, in a long-strung-out line, instead of a huddled, heaving mass, and Stanley began to concert his plans to desert.

From Damascus they made a line to El Kuneitra, then on to Samak, and past the head-waters of the fever-stricken Jordan Valley to Nazareth, the German G.H.Q., where they reported for orders.

On again, bearing west and south, till they sniffed the salt breezes off Haifa, and could see Carmel's bold outline jutting into the plain. Still bearing south, they travelled till the sergeant informed them that the next night would see them at Tul Keram, where, *Gott sei Dank*, he handed them over, and his job was done.

This was exactly the information that Stanley desired; so, bidding the cattle convoy a long farewell, he slipped away that evening, and was well on the final stage of his journey across the line before his absence was discovered next day. The *Wachtmeister* philosophically remarked when he heard about it that he wasn't going to bother himself, and that one *Schweinhund* was very much like another, and so kidnapped the first man he saw to take Stanley's place.

Jerry, now near the front-line, could not afford to take a chance, and thus pursued a characteristically bold course.

He knew it was only a matter of time before he encountered Germans of some sort, and consequently made straight for the first he saw, and in fluent Arabic demanded to be taken to the nearest Intelligence officer. He had correctly forecasted their attitude: they began by abuse, and then, finding they could not get rid of him, took him to the nearest German officer, to whom he reiterated his request.

The officer at once summoned an interpreter, on whom Stanley forthwith opened fire: '*Ana ibni belad, lakin dilwakti betal Mukhabarat Turki wa andi haga mohim alashan el askaria Hindi*' ('I am an Egyptian, but I now belong to the Turkish Intelligence Service, and I have something important for the Indian troops')—a statement which, coupled with a sight of the propaganda fly-sheets, caused his immediate despatch to the area Intelligence officer.

To this gentleman, Nachdorff by name, he repeated his story, showing the wad of sheets, with the doped one securely hidden in the bundle, and was thus sent by car to the nearest point in the line opposite the Indian troops, and at dusk taken out by a patrol into No Man's Land (which here was from two to three miles broad) and cast loose, with full instructions how to proceed.

As he had no desire whatever to meet the Indian contingent, Stanley naturally bore in the opposite direction as soon as he was well away, and in due course encountered a patrol of a British Territorial battalion, whom he had at first considerable difficulty in convincing that he was a white man, far less an officer.

However, when they got back to the front-line all doubts were resolved by Stanley asking leave to telephone to G.H.Q. for a car to be sent for him; and within three hours of leaving the Turkish front-line he was safely at his journey's end, with his laboriously acquired invaluable information of the forthcoming German effort.

SOME BRITISH BIRDS.

I.—BIRDS OF THE DUSK AND THE STARLIGHT.

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals, Tracks and Tracking*, &c.

I.

ST AGNES' EVE—ah! bitter chill it was;
The owl, for all his feathers, was acold;
The hare limp'd trembling through the frozen grass,
And silent was the flock in woolly fold.

So said Mr Keats, who seems to have been one among a very few of our poets who knew anything at all about owls. At all events Keats was evidently aware that owls, in spite of all their feathers, are no more immune from the terrors of cold than are other birds which may not be so warmly clad. During an extremely cold snap, a few years ago, I came across a barn owl so weak that it could only just manage to flap from one willow to the next along the river-margin; and on another occasion, after a severe frost, I found a long-eared owl lying dead, with head upheld on a gravel-bank.

A good deal has been written about the feathers of the owl, which enable him to fly with such muffled flight that he can surprise his quarry lurking in the grass. It has often occurred to me, however, that the silence of the owl's flight may be to enable the bird itself to hear, rather than to prevent others from hearing it. In his hunting the owl is dependent upon the minutest sounds for guidance, and any one who has ever flown will realise that it would be impossible to hear anything at all in the air unless flight were as noiseless as it is capable of being.

Our four British owls are: the barn owl or screech owl; the brown or tawny owl, which is the gentleman who hoots; the long-eared owl; and the short-eared owl. The little owl has been introduced, and is, unfortunately, increasing.

Generally speaking, the barn owl is the screaming owl, and the tawny owl the hooting owl. Incidentally, the 'ears' by which the long-eared and the short-eared varieties are named are not ears at all, but merely personal adornments, like the tassels on the ears of the lynx and the squirrel. Such adornments, as a rule, answer some practical purpose, for Nature does not lavish her gifts in the way of useless ornaments. They are unusual, and the unusual in Nature is terrifying. Therefore it may be that the tassels of the lynx, the squirrel, and the owls are to terrify—defensive in the case of the squirrel, offensive (paralysing) in the case of the others.

II.

The barn owl is probably the commonest of our four British species, and in point of fact its distribution is over almost the whole of the earth's surface. This is very strange, since the barn owl is essentially a stay-at-home bird. It is probable that the majority of barn owls in this country live and die within two miles of some central landmark, and that, unless exceedingly hard winters beset them, they never wander outside that limited area. It is not difficult in the case of the peregrine to realise its universal range; it is a strong-flying and restless bird, and the young peregrine seen over the Perthshire hills at the time at which I write may conceivably be hunting the foothills of the Himalayas ere these notes go to press. The case of the barn owl among birds is, however, almost analogous to the case of the porcupine among animals. An individual porcupine may spend the whole of his life in one poplar-grove. When a forest-fire comes, every porcupine within the fire-belt perishes, and it takes years for them to creep back into the burnt area. Thus we often find localities named after the porcupine where these creatures are entirely unknown, such as the mining-camp of Porcupine, north Ontario. On questioning the Indians, however, we learn that porcupines are abundant in the valleys to north and to south, and a few years ago were plentiful in the valley so named, *but that fire exterminated them.* It takes the porcupine population years to make their way back over a few miles of country in which they have been destroyed, and similarly in bird-life the distribution of a species is usually decided by its habits. The wanderer may be world-wide; the stay-at-home is generally limited to one region, or, if it appears in many regions, it differs widely in each as the result of long environment. The barn owl is an exception, in that it is universally distributed with very little variation—the why and the wherefore of which we can only attribute to its extreme ubiquity.

 [*All Rights Reserved.*]

This is a lovable bird, and probably the least destructive of the four. An individual may acquire bad habits, and some gamekeepers are ready enough to seize upon such isolated examples as representative of the race; but the game-killing barn owl is the exception rather than the rule. Tawny owls are astir earlier in the evening and later after daybreak than barn owls, and therefore they are more likely to acquire the habit of visiting rearing-pens, and to learn the ease and luxury with which a living may thus be derived.

The screech of the barn owl may be sinister or it may be joyous, dependent on one's mood. Leaning on the garden gate and inhaling the scent of the flowers before retiring to bed, it used to appeal to me as a sound as full of the romance and poetry of the night as the song of the nightingale.

III.

Unlike the tawny owl, the barn owl is extremely difficult to rear. When I was a boy I three times made the experiment, which was never successful. Repeatedly, however, we reared tawny owls. They will eat almost anything they are given. One of my pets, indeed, was found dead, owing to an exceedingly juvenile brother having fed it on a tram-ticket!

I have seen it stated in ornithological books that the tawny owl is given to fishing, and of course this may be so; but though, within my own experience, I have come across several examples of the barn owl taking trout, I have never known a tawny owl to do so. On the river Wharfe there were, perhaps, fourteen nights in the season when the big trout took to frequenting the very shallow water in pursuit of an insect the hatchings of which were of very brief duration. During these nights, when out fishing, there was little chance of sport owing to the abundance of natural feed, and therefore I was able to devote my time to the observation of wild nature. The big trout could be seen moving about on the shallow gravel-beds—indeed, for the fun of the thing, I have at such times changed my tackle and foul-hooked fish with a Stewart tackle—and always, on these occasions, I have noticed barn owls winnowing up and down the river-edge, undoubtedly in search of fish. I have never seen one strike a fish, but I have heard disturbances which seemed to suggest such happenings.

Again, near to my home was a small spawning-brook into which thousands of adult trout passed at the back-end of the season, and I repeatedly noticed that, immediately the trout began to run, barn owls and village cats took to frequenting the banks of the burn in great numbers.

Tawny owls are essentially woodland birds. Often they nest in ruins, but seldom in barns or outhouses. In the ruins of Kenilworth, as in Bolton Abbey, I had opportunities of studying them, and often saw them take their prey. As for the value of silent flight in approaching their quarry, I noticed that the tawny owl often 'shouts' immediately on launching forth from his look-out post to descend upon his prey—evidently to inspire fear; so noise of descent would seem to be in his favour rather than otherwise. On clutching his quarry he 'shouts' again; then, returning to his perch, he sits motionless for a time, hooting solemnly, ere proceeding to gulp his victim. In the gloom it is usually impossible to decide whether the victim is bird or mammal.

IV.

The long-eared owl is a lover of our dense larch forests. It does not generally exist except where such evergreen forests clothe the hillsides. It utters a plaintive mewing cry, which, in the general bedlam of the night, requires some concentration of mind to assign it to its rightful creator. It usually nests in the old nest of a ring-dove, or in a squirrel's dray, though one pair I knew in upper Wharfedale nested among the fibrous roots that overhung a deep wash-out running down the centre of a hardwood forest.

I was visiting some friends in Nidderdale, when one day it was decided to 'spring clean' an outhouse adjacent to the back-door, where a terrier was nursing her puppies, which had been given a nest in a soap-box. The puppies were, perhaps, five days old. The box was placed in the yard during the cleaning process, and for a brief period, while the servants were busy, the terrier left her charges. Just at that moment my host and I were walking across from the stables. It was the close of dusk. Nearing the yard, we saw the terrier run back to her puppies, and at the same moment a long-eared owl, doubtless one of the pair that were nesting in the grounds, flew over our heads, carrying something strange in its claws. My friend said, 'I do believe that is one of Nell's puppies!'

We hurried up to investigate. There were only three puppies left. Previously there had been four; and, of course, it was the best that was missing!

Except on the east coast of England, the short-eared owl is not a particularly well-known bird. I believe it was practically unknown among Scottish naturalists who had no book-knowledge, before the Border vole plague of 1891–92. This bird is a migrant, its movements coinciding more or less with those of the woodcock—not that it follows the woodcock, but that, probably, the same conditions of wind and weather influence them alike. Being a migrant, it is more gregarious than our other owls, if not more sociable.

The barn owl and the tawny owl are distinctly solitary birds, but I believe the long-eared owl

is given to social meetings. Walking along the road between Burnsall village and Barden Tower very early one morning, I heard an immense hubbub of small birds in a larch at the edge of the dense evergreen forests at the roadside. I said to a stone-breaker seated at his work near by, 'I believe there is an owl in that tree.' He replied, 'There generally is, this time of day.'

We adjourned to the spot, and what was our surprise on beholding, not one owl, nor even two, but a whole flock of long-eared owls seated in the branches, without any attempt at avoiding detection! It looked like a meeting of two or three families, indeed a gathering of the clans; and as we watched they flew away in ones and twos, choosing various directions.

One never sees a similar gathering of short-eared owls, for the very excellent reason that they are not tree birds. They are birds of the swamp lands and level marshes rather than of the broken hill-country.

In my fourteenth year or thereabouts I was walking with a school friend along the banks of a stream near Oakham town, when we put up numbers of birds in the space of one hundred yards or so bordering a woodland. They rose for the most part at our feet from the grass and brambles, and I took them to be a new species of woodcock! On being disturbed, however, they proceeded to fly up and down five feet or so from the water, and I saw then that they were owls. My studies were much hindered by my friend, who, having no interest in bird-life, amused himself during the whole time by throwing clods of earth at the birds and *at me!* Here, then, was an example of the gregarious habits of the short-eared owl, if not of its sociability.

In July 1919, near the sea, in Kirkcudbrightshire, I was surprised to see one of these birds circling like a buzzard in broad daylight at a height of about two hundred feet from the ground.

It is a very prolific owl, and lays normally about seven eggs. During spells of periodic increase, however, it may produce as many as ten or twelve eggs, the size of the clutch seeming to be governed entirely by the abundance or otherwise of food, a condition of things which applies in the case of most wild birds and beasts—and a wise condition, too, on Dame Nature's part. The abundance or otherwise of food decides the number of young the parents are able to maintain.

One cannot make reference to this bird, the short-eared owl, without mention of its mysterious migrations to localities where food is most abundant. During the Border vole plague already referred to, short-eared owls, hitherto almost unknown in the locality, flocked in hundreds to feed on the voles, coming evidently from overseas. What guides these birds on such occasions is, of course, one of those mysteries of nature we cannot solve; but it is during such times of plenty that the periodic increase above mentioned takes place, the owls in the vicinity producing enormous clutches, and so, themselves, correspondingly increasing—rising, as it were, to the occasion. It is thus that Nature regains her balance.

The vole plague of the Border country and the subsequent influx of owls was by no means unprecedented. Similar plagues have occurred all over the world where voles exist; nor are they limited to voles. I have seen thousands of prairie hares scattered all over the landscape in a dead and dying condition after a period of increase which flooded the country with them, to be followed by Nature's inevitable remedy for reducing the stock to normal numbers—disease. In this case not only owls, but foxes, weasels, lynxes, and birds of prey of every variety thronged in millions to feed on the hares. Thus, when disease comes along, a time of terrible hardship follows. The lynxes and the foxes pack, seeking some far-off hunting-range; the weasels simply disappear; and those who have wings to fly flee to some distant land.

Water-voles, or water-rats, are likewise subject to periodic increase, though usually on a very local scale. Uncountable numbers of them may suddenly appear in a certain locality, perforating the river-banks, and crowding themselves out into the surrounding meadows and woodlands. What becomes of their numbers is a mystery, for disease is not among their foes, yet in due course they disappear, and possibly a few months later not one remains.

V.

The great horned-owl is the fiercest of northern birds. It will attack and kill any bird or beast its own size. I mention it in order to illustrate the curious fact that, even in countries where it does not exist, other birds have an extensive dread of it, and a very excellent method of destroying vermin birds of all kinds is to procure a stuffed horned-owl, so mounted that, by pulling a string, it can be made to move its wings. The stuffed bird is then placed out in the open, and the gunner, string in hand, takes up a hiding near by.

I have never tried this method, but am informed by a French gentleman, who is a keen sportsman, that on his estate (where the great horned-owl is not a native) he practises it annually as a means of keeping down vermin. He assures me that magpies, crows, and even hawks at once throng to the spot, and become so intent upon mobbing the owl that they return repeatedly, even in the face of gun-fire!

The fern owl, night-jar, or churn owl is not, of course, an owl at all, but is one of those unfortunate creatures that possess a multitude of names, almost every one of which is misleading—for example, night-hawk, goat-sucker, and

so on. It is merely a glorified night swallow, and is an entirely harmless and a very interesting bird.

I have many times watched these birds hawking for insects in the dusk of evening, and certainly they are a joy to behold. Their flight is strangely erratic, though swift, and in a sense powerful. Each night-jar has its favourite perch, to which it returns at intervals like a fly-catcher, and perched there, lengthwise with the bough, it utters its strange churning song, from which, doubtless, it has obtained its name of churn owl. Like the buzzard, this bird has a curious, hovering method of descent, coming to earth with both wings extended vertically above its back.

As in the case of the drumming of the snipe, we have in the flight of the night-jar an example of 'sound communication' which is not vocal. In bird and animal life means of sound communication, over and above the ordinary cries of alarm, of joy, of despair, and so on, are more or less rare. We have them in the thumping of the rabbit, which conveys the warning to those underground as well as to those feeding on the green-sward; we have it, again, in the smack system of the beaver and the musquash, which, by striking the water with their tails, spread the news of danger far and wide, so that those working under water are prevented from rising haphazard. Again, the elk and the moose, having roared themselves hoarse, issue the challenge by thrashing the undergrowth with their antlers. The drumming of the snipe is, apparently, designed to lead away the intruder.

But in the case of the night-jar the signal is not an alarm-signal, for fear seems to be unknown to this child of the twilight. It simply conveys the intelligence and the inquiry, 'Here am I! Where are you?'

One particular instance sticks in my mind. It was on the river Wharfe, and after midnight, when, from sheer fatigue, I left the trout still rising freely, and made my way across the scented meadows towards the white-walled homestead nestling under its chestnut-trees. On the way I heard two night-hawks flapping to each other, now fifty yards, now three hundred, now four meadows apart. One would flap twice, and immediately two flaps would come in answer. There would be a pause, then four rapid flaps, surprisingly near my head, and faint and far from the distance the answer would come. Generally, but not always, the signal was answered in the same number of strokes; at times two might answer four, or six might answer one, but it was clear to any one listening that the birds were carrying on a primitive form of Morse telegraphy, as no one with me at the time could have doubted. And this is but one incident out of many I have observed when the flapping of the night-jar, casually remarked upon by so many naturalists, has struck me as being used by a courting couple as a means of keeping in touch with one another.

The night-jar family is a very large one, and in the bush localities of the New World I have been impressed by the powers of flight of a bird which I do not doubt belongs to the night-jar tribe. It has white-slashed wings, and its flight is characteristic of the family. Its powers of flight, however, pass all belief. Compared with it the swift is a slow mover, and even the peregrine a sluggard. For days none of these birds may be seen; then, just preceding a thunder-storm, thousands of them swarm, as though by magic, across the sky. Whence they come no man can say. The sky is dark with them. Fifty, a thousand, two thousand feet up they can be seen, while the air veritably shakes with their shrill cries and the vibrations of their pinions. I have lain on my back watching them, absorbed with wonder, heedless of the coming storm. There is one on the skyline—he is overhead—he is falling earthwards with a veritable roar of vibrating pinions. He almost brushes the tree-tops; then, in a moment, he is careering heavenwards again in crazy bounds; he is a mere speck in the gathering sky; he is away in the distance among a thousand thousand of his kind.

One feels a thunder-spot on one's face, and wakens to the realisation that the canoe is on the storm side. It takes but a few seconds to beach it, but on looking up—where are the thunder birds? Gone! Vanished like vapour into the ether of the infinite! Not one remains, not one is to be seen or heard; and now the rain begins to fall thick and fast, and other things claim one's immediate thoughts.

I should like, ere closing this article, to relate three incidents within my experience concerning the night-jar. A keeper who for many years served my father possessed a retriever which one day brought to him in its jaws a living night-jar. He took it, uninjured, from the dog's mouth, and placed it on the gravel path. The bird crouched a moment, then immediately returned to its nest, which was at the foot of the garden not forty yards away, and from which the dog had no doubt lifted it. I might have been inclined to disbelieve this story but that the old fellow, who could neither read nor write, and whose memory lives in my mind among the kindliest of recollections, was too unsophisticated to lie, and knew too much for such futility to appeal to him as worth while. Years later I read St John's story of a retriever lifting a partridge from her nest—a strangely parallel case.

Again, in my early boyhood my brother and I were climbing a tree which, I believe, was an acacia, though evidently a thornless one. (Visiting my old home recently, I think I identified the tree.) Looking down, I saw something

which held my attention for some seconds. I said to my brother, 'I believe that is a night-jar resting on the branch below us!'

He answered, 'No; it is a mushroom' (meaning, I suppose, a fungus).

Just then the bird looked up at us, and all doubt was settled. We had climbed past it, stepping on the branch within a yard of it, yet it had not taken fright during our noisy rambles all about its nesting-place!

In France, during the war, I one day saw a night-jar seated on the hot railway metals within a mile of our own artillery. I said to my friend, 'That bird will be killed next time the "tacco" comes along.'

We walked up to it. Its eyes were shut, but it opened them as I reached down to clutch it. My hand was within a few inches of it when it fluttered off, and tried to settle on the edge of a sheet of upturned corrugated iron. Failing in this, it fluttered feebly to earth, and there we left it—so exactly matching its muddy, trampled surroundings as to be almost invisible immediately it met the ground.

MAN'S WORK.

CHAPTER I.—*continued.*

IV.

TWO or three hours later Brooks hooked his arm into that of his partner, and turned homeward. He said little, and walked with a step that was for him unusually deliberate. Sitwell, too, was rather silent. It was in his mind that a spoke had been put in Shanklin's wheel, and the idea pleased him. Presently he stopped at a florist's, selected a large cluster of early roses, and slipped his card in amongst them. Brooks looked on quizzically.

'Coming up for dinner, aren't you, Sit?'

'Not to-night, thanks.' Sitwell had his own way of doing things, and his plan of campaign required careful thought. 'Meet you at the office to-morrow. Remember me to Claudia.'

Brooks watched the tall, slim figure till it turned the corner, and wished that Sitwell had accompanied him a little farther. He was experiencing a queer breathlessness that sometimes came over him of late. He had jokingly put it down to age, and never to the fact that he lived too well and took practically no exercise. He was thankful when he reached his apartment and sank into a big chair by an open window. The breeze came down from the Sierra Madre like a cool, invisible caress. Presently he felt better, and, lighting a big cigar, let his eyes wander round the room.

On the mantelpiece was a photograph of Shanklin, signed in his even script. Scrutinising it, Brooks became conscious of more anger than he had yet felt. The face was smiling, and here, in his own establishment, it began to look curiously over-confident and even arrogant. So this was the youth who sat at a desk and criticised men old enough to be his father. What, he now wondered, might not be Shanklin's attitude after he married Claudia? The thing began to work venomously in his brain, till, without realising it, he strode over and stood staring down at the straight mouth and steady eyes. Just then a door opened and he heard a laugh.

'That's an excellent omen, father. I've never seen you do it before.' An arm slipped into his own, and he looked at the girl with a glance in which affection struggled with discomfort. It came to him that, since the thing had to be done, it were best done quickly.

'Perhaps you'll never see me doing it again,' he said gravely.

'What do you mean?' Her brows were suddenly wrinkled.

Brooks examined the tip of his cigar. 'Sit down and I'll tell you.'

He regained his chair, and she perched on the arm of it, close to him, yet at the same time remote. He did not look at her as he began to speak and recounted what had happened that morning in Burley's office.

'At first I didn't realise just what he meant by saying we'd better take the work somewhere else. I reckoned he was full up. Then, just as we were leaving, Sit got at the truth of it. John thinks we're crooks,' he concluded sharply. 'He didn't put it that way—but he intimated it.'

'Ridiculous—you're my father,' she expostulated swiftly. 'I'll see him at once—there's some dreadful mistake.'

Brooks shook his big head. 'No, you won't see him at once—or at all. I understand English as well as any one—and so does Sit—and so does Burley. He knows about it.'

The girl was on her feet in an instant. 'Father, it's impossible. What did Mr Burley say?'

'We didn't wait for that. He was just beginning it when we left. But I can imagine it.'

'Dad,' she answered, her whole soul in her eyes, 'let me straighten this out. John is coming in this evening; he said so yesterday. There's something wrong. I know it here'—she touched her breast.

'What he said yesterday may differ a little.' Then, catching the pain in her dark eyes, 'If he likes to clear himself to you, and then to Sit and me, I'll forget it, not for his sake, but yours.'

She kissed him joyfully. 'You're the dearest and best father there ever was. Of course he'll

do it. Don't forget that I know him better than either of you.'

'You know Sit pretty well too, daughter, but you wouldn't have him.'

Her eyes became thoughtful. 'Yes; but I never felt about him the way I do about John. There 's something in me that answers now. It didn't before. I've a funny idea that you were something like John—at his age.'

There followed a little silence, in which the past years rolled away and Brooks saw himself as he was at the time of his marriage. There were occasions when Claudia baffled him. The mother, loyal, beautiful, and spontaneous, was reincarnated in her child, and that had been enough for Brooks. Yes—perhaps he was something like Shanklin—years ago.

'If this thing doesn't come right—and I've an idea it won't, in spite of what you say—don't worry about it. You 're only twenty, and your life is ahead of you. It 's in my head that you 're the kind that wants to fight folks' battles for them. . . . Don't!'

She smiled whimsically, kissed him again, and disappeared into her room, and Brooks's mind turned automatically to business matters. There were no lines of care in his face, and not for worlds would he have let the girl perceive that for months past the partners' resources had been steadily shrinking, till now, as a desperate resort, they had come to the step taken that day. The thing was, as Shanklin at once perceived, quite deliberate; but the attitudes of the partners differed considerably. Brooks regarded it as something which under other circumstances he would not have done, while Sitwell for years past had considered the great army of the ignorant as his legitimate spoil. What rankled in Brooks's mind most of all was that the scheme should have been deciphered by his daughter's fiancé. He blamed himself for ever entering Burley's office.

V.

At eight o'clock that evening Shanklin picked up the telephone in his room and held it for a moment uncertainly. He had considered writing to Claudia for an appointment in town next day, but finally decided to go to Brooks's apartment —even if it were for the last time. On the way he wondered how much she had heard, and how the thing had been put to her. He was overjoyed when she received him with her wonted pleasure and affection. Brooks was not visible.

He yielded, as always, to her beauty and charm, but now she seemed more desirable than ever, being touched with a wistfulness he found infinitely appealing. From the first she had roused in him a protective instinct, which he recognised as profound and lasting. To be her guardian meant as much as to be her lover. They talked for some moments while her hand lay unresistingly in his.

'I'm worried a bit to-night, Jack,' she said presently, with a shadow in her dark eyes.

'Tell me.'

It was Claudia's habit to get straight to the heart of things. 'About father—he 's worried too. Should a girl ever attempt to adjust a business misunderstanding?'

'There 's nothing I don't want you to know about,' he said slowly.

Her face brightened. 'I hoped you would say that—so tell me what happened to-day.'

'That was a matter in which Sitwell took the principal part. I had no desire to involve Mr Brooks.'

'But father feels now that he is involved. He talked to me about it, and if you hadn't come to-night I should have asked you to. I 'm not thinking about Mr Sitwell, but about dad.'

'What does he say?'

'That he hoped that you 'd straighten it out to-morrow; then we 'd all forget it. He thinks it quite natural that you should do his legal work, and is hurt and surprised that you won't —for he says you won't.'

Shanklin hesitated, with an overwhelming conviction that, such was the girl's transparent honesty, he would never be able to make this thing clear. It touched him too closely. The security of his love was suddenly assailed. Had she been worldly or calculating it would have been otherwise.

'It was Sitwell who really brought about this difference. Mr Brooks was content to let the thing be as I asked. And,' he added significantly, 'I know why Sitwell did it.'

She flushed a little, but, being in arms for what she considered her father's honour, stuck to her point.

'Dad and Mr Sitwell had agreed on something connected with this new company, and you refused to have anything to do with it. Isn't that so?'

'Yes,' he admitted.

'Then tell me why, Jack. Was it the real reason that you had too much work?'

He looked her straight in the face. 'No; and, extraordinary though it may seem for me to say so, your father wasn't keen on it at all. Sitwell insisted, and Mr Brooks yielded. I think he 's tired—anxious, and overworked. Anything I've got is at his service—you know that — but not for this particular purpose. What would you think of me if, in the way of business, I raised no questions, but did what I was asked without a word?'

'Will you tell me, then, just what you were asked to do?'

'I can't,' he said gently. All he held dear in life was at stake.

She drew away as though he had hurt her. 'Not even for me?'

He did not answer.

'Don't I come first any more, Jack?'

He caught at her hand. 'I love you with all my soul, but——'

'I didn't think there were any "buts" in love.'

'And I'm thinking of the thing love is based on.'

She glanced at him curiously. 'What is that?'

'Self-respect. If I throw that overboard, I've got nothing left fit to love you with.'

'And you were asked to sacrifice that?' Her lips parted. 'And by my father?'

'Don't,' he protested. 'Won't you——'

'My father!' she whispered; then, swiftly, her whole consciousness revolting, it seemed that he was associating her father with tricksters. Sitwell at that moment held no place in her mind—her loyalty, her natural affection, every legacy of childish memory rose in violent protest. She shot a stinging question.

'I'm not judging your father,' he said shakily, 'but myself.'

'But you prefer not to do business with him.' She had turned very pale, and was staring at a small engagement-ring that Shanklin had slipped on her finger a month previously. It was a single stone of no great value, but she treasured it like a crown jewel.

'Claudia,' he begged, 'don't!'

She drew off the ring, feeling all the while a desperate tugging at her heart-strings. She had not dreamed that love could hurt so much.

'I'm sorry, Jack. It was probably all a mistake our being engaged. It must have been—or this couldn't have happened. I told father I could straighten this all out, but you won't let me. You see, I thought I knew you better than I do.' Her lips trembled in spite of all her efforts.

Shanklin's pulse stood still. It swept over him in a flood that here and now, if he could only take her in his arms and explain that it was all the mistake of a moment of thoughtlessness, and that he would tell her father so next morning, he could yet save his happiness from shipwreck. It was so quickly and easily done. Then there would be tears and smiles—with Claudia in his arms again, and talk of a bungalow amongst the palms near Pasadana. But in the middle of all this came the whisper he had heard first as he scanned Brooks's title-deeds spread out on his desk, and the whisper demanded to know how he really proposed to interpret life. Claudia did not enter into it—or happiness—or fortune. It was just the plain, quiet question, 'Where do you stand?' All afternoon and evening it had persisted, and now the time had come to make answer. He made it in his own peculiar way. 'Claudia, I'll love you all my life, wherever you are.'

They stared at each other, these two between whom had dropped a curtain of division. Claudia was deadly white, and her eyes, large, luminous, and touched with sudden fear, accentuated her pallor. Her lips moved, but no words came. Shanklin stood, his shoulders set, his lips compressed, every fibre of his body yearning for the girl of his choice. There was so much for them to do together—so much joy they could create one for the other. The ring dropped with a little tinkle on the polished table. He looked first at the trinket, then at her.

'All my life,' he whispered.

When she raised her head he had gone. The apartment was very still. The last half-hour might have been a dream, till her eyes fell on the ring close beside her. She picked it up, mutely reviewing the day when it had arrived. It was insignificant beside the jewel which had before been offered by Sitwell and refused, and she had treasured this one for its very simplicity. Now the touch of it brought everything to life again.

Came a knock at the door, and a maid entered with a long box.

'Flowers, miss; shall I undo them?'

'No—thank you—leave them.' It was in Claudia's mind that if these were Shanklin's she would make still one more effort. Soon her lap was piled with perfect buds, whose fragrance filled the room. She picked up a card, her fingers trembling, and stared at it incredulously. Then she bent her head slowly over the blossoms, her tears coming like rain.

(Continued on page 41.)

THE ANDAMANS AND THE NICOBARS.

By Lieutenant-Colonel C. C. R. Murphy.

I.

THE recent decision to abolish the large penal settlement in the Andaman Islands, which was established there during the dark days of the Indian Mutiny, brought those strange possessions of the British Empire temporarily into the limelight, and therefore a short account of them may be of interest.

The Andaman and the Nicobar islands are situated towards the eastern side of the Bay of Bengal, close to a great highway of commerce, which is traversed by ships of all the most enlightened nations. Yet the civilisation of both the East and the West seems to have passed them by, without in any way affecting the inhabitants. It is probable that in the Andaman jungles at the present time natives are in the same state as

that of their remote ancestors. They wear no clothes; they speak a language so crude that it is scarcely adequate for their own poor needs; they know of no God; they are totally ignorant of agriculture; and their food, with the addition of shell-fish, is very much like that of monkeys.

In the earliest known narrative of these islands the inhabitants are represented as cannibals of truly frightful aspect, with huge misshapen feet a cubit in length, and as using poisoned arrows. The Andamanese, however, are not cannibals, their feet are of ordinary size and shape, and they do not use poisoned arrows; otherwise the description is correct. They are small people, and certainly very black, with woolly hair, but their lips are not thick like those of the negro. From an ethnological point of view they are an extremely interesting race.

The principal settlement in the Andamans is Port Blair, where the majority of the small European community live, and where there are detachments of British and Indian infantry. It is a picturesque but sleepy place; the very look of it from the deck of a ship makes one yawn. As you steam into the little harbour you begin to nod, and to dream of a life of drowsy contentment; but you awake with a sense of immobility that is almost paralysing. You can scarcely drag yourself out on to the sands to look for a footprint.

The Indian daily meteorological reports often announce 'a depression in the Bay of Bengal, with its centre in the Andamans.' Although the lotus-eaters of Port Blair are not weather-prophets, the fact of these islands being described as a centre of depression seems natural enough to them. As a matter of fact, storms frequently originate in the Bay of Bengal, and often very timely information regarding cyclones comes from the Andamans.

Although one would naturally be diffident about recommending any one to settle in the Andamans, except to get away from coal strikes or the New Rich, still there are many wonderful things there. For example, the settlement mess, which is in the charge of the local authorities. It was formerly a fowl-house. One day, it is recorded, a new commandant arrived, and being a man with progressive ideas, he asked for a new perch, or a coat of whitewash, or something equally trivial for the mess. He received a reply to the effect that, as there were only about twelve thousand five hundred convicts there at the time, there was no labour available; further, that the request was considered unreasonable, as the settlement officer had been there for twenty-five years, and such things had not been asked for before. Of course, this official might have said that he could not provide a coat of whitewash without the trousers as well, but that would have been a mere vulgar play upon words, whereas the reply he sent was really humorous.

In the main islands there are virgin forests, of great value, containing large areas of padauk-trees, the wood of which is a beautiful red colour, and takes a fine polish. Formerly there were Government tea-gardens in the Andamans, but the soil was not suitable for tea, nor was the tea suitable for drinking purposes. It was very bitter, and brought on shakiness. In fact, some of the soldiers stationed there could not salute without knocking their helmets off.

II.

The one event with which the Andamans will always be associated in the public mind is the murder of Lord Mayo, who, whilst Viceroy of India, was assassinated there by one of the convicts in the settlement in 1872. Some years later another tragedy occurred, which, though of less general importance, cast a great gloom over Port Blair at the time. On that occasion one of those cyclones already referred to swept over the islands with such violence that the Royal Indian Marine ship *Enterprise* was driven from her anchorage on to the rocks in front of the women's jail, where she foundered. A few of the crew managed to climb up the rigging, and to remain clinging there till morning broke, when the fury of the storm abated. Some of the female convicts, seeing the plight of these lascars, improvised ropes from their clothing, and succeeded in rescuing them.

The forcible resentment displayed by the Andamanese to all intruders has led on occasion to fighting, and it may not be generally known that the Little Andaman island was once the scene of a remarkable exploit for which no fewer than five Victoria Crosses were awarded. On the 6th May 1867 a party of the 24th Regiment was sent from the detachment stationed at Port Blair to ascertain the fate of the captain and crew of the ship *Assam Valley*, who were reported to have landed on the Little Andaman, and to have been murdered by the natives there. The steamer *Arracan* left Port Blair with the party on the day mentioned, anchored for the night in East Bay, and next day ran along the south coast of the island, and cast anchor about a mile and a half from a rock supposed to have been the scene of the massacre. The second cutter was manned and sent in, and a landing effected through a very heavy surf, the men wading to shore through five feet of water.

This party marched towards the rock, the first cutter moving along outside to cover those on shore. They had not advanced far when the natives began to show themselves and discharge their arrows. About fifty yards from the rock a skull was picked up which was afterwards pronounced to be that of a European. After the party had expended its ammunition in replying to the natives, a signal of recall was made; but in the attempt to repass the surf the second

cutter capsized and was washed away, and an officer of the 9th Bengal Infantry was drowned. Covered by the fire of the first cutter, the party on shore then marched back to East Bay, but all attempts to get boats into the bay failed. After finding the bodies of four men, partially buried, the party moved back to the first landing-place, where a raft was sent in to them. An officer and one of the men were swept off the raft by the surf, and were dragged ashore terribly exhausted. A volunteer crew was then made up on board the steamer, consisting of the assistant-surgeon and four soldiers of the 24th, who pluckily took the steamer's gig into the surf, but finding that the boat was filling fast, had to put back again. A second attempt was more successful, and five of the shore-party were brought off safely and put into a boat outside the surf. A third trip brought off the remainder. The expedition returned to Port Blair the next day.

The Victoria Cross was bestowed upon the doctor and the four soldiers, who by their gallantry had saved seventeen officers and men from the horrors of a fate of which death itself was probably the least. One of the recipients, Private David Bell, 24th Regiment, is still alive.

III.

South of the Andamans lies another group of islands, known as the Nicobars, and though they are close to a busy thoroughfare, no steamers ever call there except an occasional vessel belonging to the Royal Indian Marine. The result is that the interiors of some of these islands are practically unknown. When any one does go ashore there the excitement created is remarkable, not only in the jungle, but even in the water. Fish of gorgeous colours dart away from the boat as you row ashore; tiny black monkeys chatter wildly at you as you paddle up some creek into the virgin forest; flocks of parrots, with their long tails sticking straight out behind them, fly screaming away; in fact, there is no sound that does not rail at the intrusion.

In the Nicobars one can obtain interesting curios in the shape of shells and scare-devils; the former are to be found in wonderful variety, and some of them are almost large enough to have a bath in. The natives do not use money, and all bartering has to be done with rum or top-hats. The elders of some of the tribes affect this form of head-dress, and sometimes the squire of the village is to be seen with a top-hat on, and nothing else whatever. The scare-devils are crude wooden effigies, made to keep away all evil spirits, except those which intoxicate. Unlike the Andamanese, the Nicobarese are not a pure race, but a mixture, and they seem to have made a hobby of trying to look ugly. Why, therefore, any self-respecting devil should be scared by these harmless toys and not by the inhabitants is hard to understand. The Nicobarese live in curious huts, which look like large beehives perched on piles. They are entered by means of a ladder leading up from the ground through a trap-door in the floor. At night when every one is present the father of the family calls the roll, and then pulls up the ladder to prevent any one from breaking either in or out of barracks.

There are some queer birds in these islands, notably hornbills, with huge beaks, and megapodes, with society habits. The latter bird, which is a kind of small wild turkey, is rapidly becoming rare. The hen buries her eggs in the sand, and leaves them there to hatch themselves. It saves trouble and avoids scandal.

'I M.

PART II.

IV.

'BUT surely,' said the young man—'surely you did find out in the end, didn't——'

''Old 'ard a bit, mister,' interrupted Jim—''old 'ard a bit; I ain't done yet. As I were agoin' to say, when we goes into t' fo'c'sle, there were Charlie Summers—lookin' mad. Up 'e jumps, glarin' at me. 'E says, "Mates," 'e says, "(all exceptin' 'im, as isn't no mate of nobody's), I perposes we draws lots for 'oo's 'im, an' be done wi' it. I'm sick o' carryin' on like a lot o' loonatics. Washin' our 'ands, an' wot some on yer calls yer faces, an' pretendin' to be wot we ain't. Let's draw for it."

'"Charlie," says I, "yer'd better turn in an' 'ave a nap—ye're tired, lad; it would do yer good, an' then yer won't be pertendin' of as ye're a sailor, no more."

'A soft answer turneth away wrath, mister, an' lots o' other funny things—I al'ays says.

'Eight bells 'ad struck. Jack 'Utchins comes in from his ten to twelve trick. 'E says to us, a-lookin' round, "By gum, but there's a proper 'barney' aft! T' Old Man's near killed that square-'eaded stooard. 'E says 'e's goin' to make 'im pay for t' cabin lookin'-glass which was broke, 'cos it weren't took in at dark, same as 'e give orders for."

'"Ho!" we says.

'"'Ow *did* it get broke?" says Jack. "I didn't 'ear nothin' at t' wheel."

'"'Ow should we know?" we says, makin' for our bunks.

'T' next day were a fine summer day, an' we was keepin' a good look-out for a pilot. It bein' my wheel from eight to ten, I were standin' there wi' me eyes kind o' glued on t' compass, 'cos I seed t' Old Man were lookin' at me. 'E an' t' mate was walkin' up an' down, an' every time they turns around near me t' mate shoves one o' them small paint-swabs in 'is ugly mouth for to stop 'im laffin'. I could 'ave pushed 'is face in for 'im, I were that wild, 'cos I suspicioned they was laffin' at me.

'"Jim," says t' Old Man, leavin' t' mate an' comin' snigglerin' up to me, "don't yer think yer made a blinkin' fool o' yerself las' night, wi' t' rest o' them 'alf-baked 'oodlums? A man o' your age ought for to know better."

'I never answers 'im, mister, but I could 'ave paralysed 'im—cheerful.

'"Don't yer know, Jim," 'e goes on, "as yer 've give that ink-slinger chap as much o' wot 'e calls 'copy' as 'll take 'im to Southend for a week, wi' yer carryin's on?"

'"I don't care a 'ang if it 'll take 'im to *'ell* for a week," says I. "'E can go there, an' stop there for t' rest o' 'is life, for all I cares," I says —"an' so much t' better."

'There might 'ave been more words atween us, but at that minit t' stooard comes up wi' two letters in 'is 'and. 'E tells t' Old Man as 'e found 'em in one o' 'is coat-pockets.

'"Mister," says t' Old Man to t' mate ('oo 'ad come up nosy-like, like 'e al'ays does if 'e thinks there 's anythin' goin' past 'im)—"mister," 'e says, "look 'ere! 'Ere 's two letters as t' postman 's just bring aboard, wot ain't been opened."

'"I knows what them is," says t' mate—'them 's them letters wot t' pilot gives yer at Garden Reach when 'e come aboard, an' yer 's forgot all about 'em."

'An' it were so, mister!' said Jim to the young man.

'Good Lord, Jim!' exclaimed the young man; 'what a thing to do! I suppose they were giving instructions to proceed to some other port, or something like that.'

''Tweren't nothin' o' t' sort, mister. T' Old Man 'e turns to an' opens one, which were old Sam Doss's bumboat account. Then 'e opens t' other one. 'E looks at it, 'ard. Then 'e kind o' frowns, an' just as sudden 'e starts laffin', an' 'e goes on laffin' an' laffin' an' laffin', till I, thinks I to meself, 'e 's got t' 'igh-foloots same as women gets, an' it 's dangerous in a man. So I sings out to t' mate—seein' as I couldn't leave go o' t' wheel—"Pat 'im on t' wrists, mister; pat 'im on 'is wrists!" 'E gets mad at this, an' says, "I 'll pat you on yer danged nose if yer don't mind yer steerin'." An' then 'e says to t' mate, sudden-like, "Mister," 'e says, "you take t' wheel a minit.—An', Jim, you go an' tell the 'ands to lay aft. I wants to speak to 'em."

'"Men," 'e says when all 'ands was standin' aft, "I just found a letter in one o' t' pockets o' me shore-togs. I 'd forgot to open it when I gets it at Garden Reach. It 's from t' agents in Calcutta, tellin' of me as 'ow that feller Mr Tom Hinshlewood 'ad changed 'is mind about comin' aboard of us, an' was to go 'ome by steamboat instead. That 's all," 'e says, short-like—but 'e 'ad a silly grin on 'is fat face as we turns for to go for'ard again.'

'Surely, Jim,' said the young man, 'you don't mean to tell me that this—ahem—gentleman was never on board, after all?'

'It 's a fac', sir, as true as I sit 'ere,' said Jim triumphantly. *''E never weren't aboard at all.'*

v.

'Well, upon my word, Jim, it 's almost like a ghost-story,' said the young man, laughing heartily. 'And what did the others think of it?'

'Oh,' said Jim, 'we was all took flat aback—yer see, sir—we feels such danged fools. We sits down in t' fo'c'sle lookin' at one another; then by-an'-by we sees real 'appy looks comin' in our faces. Bill 'Arding were t' first to give way; 'e starts laffin' an' laffin', till 'is laffin' got contiguous, an' we all starts—we dances—we 'ugs each other—we shouts—all wi' joy, till we was fair done, an' out o' breath. "Mates!" says I, sittin' down, "I 've got a hidea in me fore-top, as 'as just come there, an'——"

'"That 's all right, Jim," says Charlie; "yer 'll be all right wi' a day or two's rest. Yer 've just got rid o' one 'llucination, so don't be goin' for to start an' pick up wi' another, or yer 'll be put away to t' Old Man's 'foolish 'ouse' 'e was talkin' about!" But I didn't take no notice on 'im, as by this we was very friendly; so I only told 'im to 'old 'is blasted jaw, if 'e didn't want 'is ugly face altered.

'"Wot is it, Jim?" says t' others. "Wot 's yer thought on?"

'So I says, "Well, mates, it 's like this 'ere. Seein' as 'ow yer 've all taken a lot o' trouble to make fools o' yerselves all t' way 'ome, an'——"

'"Wot about yerself?" says one on 'em. "Yer was worsner any on us, 'cos yer was older, an' ought to a-knowed better."

'I takes no notice o' this bit o' hignorance, mister, an' I goes on an' says, "An' seein' as 'ow we all got to logger'eads wi' each other—through no fault o' nobody—it just come to me as it would be a kind o' nice an' friendly if we was to 'ave a tarpaulin muster for a danged good dinner all together, for to make up for all our suspicionednesses we 'd 'ad on each other. Then we 'll part—all shipmates wi' kind feelins' an' wot not."'

'That was a brilliant idea, Jim,' said the young man—'quite a brilliant idea. I suppose they all jumped at it?'

'Ay, 'deed they did,' said Jim, beaming.

'An' we makes all arrangements ship-shape for Friday night at six-thirty sharp—seein' as we'd be paid off by then. After we'd docked I goes for to see Sam Church—'e's a friend o' mine, an' keeps a pub by the Katherine Dock. Sam were fair capped wi' t' hidea, an' says 'e, "Jim, heverything will be done to bring credit to my 'ouse. Yer 'll 'ave turtle-soup (mock), eel-pie—which is my spechulty—roast-beef o' good Old England, plum-pudding (not duff), a cigar each, an' as much beer as yer all want. All for three-and-six a 'ead, me boy," 'e says. "It 'll be a proper 'à la' dinner, same as the 'toffs' up west, an' nothin' to beat it this side o' Buckingham Pallis."

'Friday come, mister, an' I were that excited, I kept goin' in for to see Sam, till 'e told me I'd spoil things a-starin' at 'em.

'At five o'clock t' others begins to come. They fair knocked me—why, I 'ardly knowed 'em, they was that fine dressed. Bill 'Arding was monsterous. Danged if 'e 'adn't got them things on 'is boots, same as you 'ave, sir, an' a collar, too. Blest if 'e 'adn't!

'At four bells (I means six o'clock) we all sits down—we couldn't wait till 'alf-pas'. I sits at t' 'ead o' t' table, bein', as I were, t' oldest; an' Jinny, she ups on me shoulder an' sits there quiet an' lady-like, only takin' a nut now an' then, or a sup o' me beer.

'Mister, that *were* a dinner! It was as Sam said it would be—a à la, tip-top dinner—an' no mistake. We finished heverything. Sam's wife 'ad sent some almonds an' raisins in, for no extra charge. Jinny near went mad over 'em, takin' 'em out o' me mouth as fast as I puts 'em in; but she were quite lady-like all t' time, not tryin' any 'uman tricks on us.

'No, mister,' Jim went on, rather pathetically, 'I'll never forget it as long as I live—that dinner; it were like one o' them fairy tales. We'd lit our cigars, after t' best dinner in London. We was mates together; no Old Man singin' out, "Lee fore brace;" no salt 'orse to eat; no nothin' but—but—— Wot's that word, mister? I can't think on it.'

'Harmony,' suggested the young man.

'Bull's-eye,' said Jim, 'first time. That's it, mister—'armony—nothin' but 'armony. I'll try an' remember that word.'

VI.

'A deuced good ending, Jim, to a beastly voyage,' said the young man. 'No wonder you enjoyed the good dinner, and——'

'I ain't finished yet, mister,' said Jim impressively. 'I ain't finished yet. *I* made a speech! I did mister. Yer may believe me or not—but I did.'

'Oh, this is capital, Jim; I must hear the speech.'

'Yer shall, sir, if yer ain't sick tired o' me talk. Yer see, sir, sailors is bad 'ands at talkin'; that's why they al'ays says "Yes," an' "No," an' wants a drink when yer asks 'em anythin', for to make 'em talk. But it were Bill 'Arding as gets me on me 'ind-legs. 'E jumps up all of a sudden an' 'e says, "Mates," 'e says, "I reckons as 'ow Jim ought for to make us a speech, seein' 'e 's in t' chair o' honour."

'"Danged if I makes a speech. I can't make no speeches," says I.

'But it weren't no good. They yells, "Speech! Speech! Chuck it off of yer chest, Jim." So thinks I to meself, I 'd better talk to 'em a bit for to keep 'em quiet-like.

'"Mates," says I, "seein' as we've 'ad a danged good dinner, an' we ain't likely for to be called on for to wash up, we may as well take it heasy for a spell. I were just thinkin', mates, as we 'd 'ad a bloomin' queer kind o' v'y'ge—a v'y'ge as might make us feel a bit silly in one kind o' way or another, but a v'y'ge as some on us might be kind o' proud of. What I means is this 'ere, mates: we was told as 'ow a hignorant hink-slinger was signed on wi' us, so as for to make a laugh on us to t' noospapers. Then we 're told as 'ow 'e didn't sign on wi' us after all, but as 'e 'd funked it, an' gone 'ome, swell-like, in a steamer. Now what I thinks is like this 'ere: If 'e *'ad* come an' we 'd a-found 'im, it would 'ave been a case o' 'Eaven 'elp 'im; but as 'e *didn't* come aboard, we was, so to speak, in a quagglmire. So we gets a kind o' nasty-like wi' each other, which we wouldn't 'ave done if we 'adn't suspicioned everybody." (I takes a good swig o' me beer then; I were gettin' pumped.) "We was all lookin' for a chap," I goes on, "as wasn't there; an' yet," says I, "there *was* somethin' there as we couldn't tumble to—somethin' as made us wash ourselves, an' stop swearin,' an' doin' a lot o' dirty things as a sailor does, unbethinkin' like. Then we begins for to be perlite, an' doin' little hacts o' kindnesses for one another, all because we thought as 'im that was supposed to be aboard—an' wasn't aboard—might go for to think we was low animals, an' beasts, so to speak, an' not fit for to be 'uman bein's.

'"Now, mates," says I, "I wants to say as 'ow, for meself, it were a good day when that silly cove thought 'e would come aboard o' us, an' didn't come—'cos we didn't know 'e 'adn't come—so we was a-feared to do anythin' what yer might call low-down. I see meself 'twere t' same wi' all on yer," says I; "an' as for meself—*I'm* for al'ays 'avin' ''im'—as didn't come—for a shipmate. Now, mates," says I, "what d' yer say? Will yer sing, 'An' so say all of us'?"

'"Ay, ay," they shouts. An' then hup we gets an' sings, all together, "For 'e's a jolly good feller."

'An', by gum, mister, we *did* give it lip!

'"Mates," says I when we 'd finished singin', "fill yer glasses!" An' when everybody were

ready, I says, "Mates, here's a 'ealth to "*'Im as was—'Im as isn't*—an' *'Im as is.*"'"

'Splendid, Jim! Absolutely splendid!' said the young man. 'What a——'

At this moment Jim, looking out of the window, exclaimed, 'Why, dang it all, mister, if we ain't at Newcastle!'

VII.

The sailor began hurriedly to collect his few bits of things. 'Ay,' he said, 'it were a rum go, weren't it, mister? That silly loonatic didn't get nothin' for to write about, wi' all 'is cleverness; but it were a dirty, low-down hidea 'e 'ad; now weren't it, mister?'

'Ahem—well——' began the young man.

But Jim went on, 'An' if I 'ad 'im 'ere this very minit, why, I'd just paralyse 'im—I would so—for all 'e made us be'ave a bit better; though it weren't 'is doin', any'ow.'

'It was a *very* interesting experience, Jim,' said the young man. 'I suppose we *must* say good-bye now, but I'm quite selfishly sorry your journey's over, as I've thoroughly enjoyed your good company. The best of luck to you, and I hope you'll have a jolly good holiday. Good-bye, Jim.' They shook hands.

'So long, sir,' said Jim, turning regretfully away, muttering as he went to collect Jinny, 'A *real* toff, 'e is. 'E wouldn't a-played a trick like that black-'earted 'oodlum—no, siree—not 'im!'

The train began to move. Two people on the platform—a lady and a gentleman—suddenly caught sight of the young man, leaning out of the window, evidently waving a good-bye to some one.

'Why,' they exclaimed, 'if that isn't Tom Hinshlewood, back from India!—Tom! Tom!' they called. But Tom had quickly retreated to the farthest corner of the carriage, saying fervently—oh! *so* fervently—'Thank heavens Jim didn't hear those idiots!'

THE END.

OUR OLDEST INDUSTRY.

By JULIAN STRANGE.

I.

THE oldest of our industries, the fabrication of flint instruments, is coeval with the hunting stage of man's existence. The first appearance of man in Europe dates from so remote a period that neither history nor tradition can tell us anything about his origin or his mode of life. We have, however, in the chipped flint instruments which have been discovered at various depths in the gravels of our present river system what are generally regarded as the earliest traces of the human race, although it was not until the middle of last century that their true significance was recognised.

The period of these early Palæolithic hunters, who chipped their implements from flint nodules, but did not polish them, stretches back into the obscurity of prehistoric time for many hundred thousand years; but when this older Stone Age merged into the newer Stone or Neolithic Age of the hunter, fisher, and shepherd who mined flints and fashioned from them various and highly polished tools and weapons, we cannot tell. It was certainly not less than nine thousand years ago.

The immense number of flint implements which have been discovered in various parts of Europe is sufficient evidence of the important part they played during the earlier stages of man's existence upon the earth. Flint was the one hard material which man learned to shape and apply to his own purposes, and it has, therefore, had a much more important influence on our civilisation than is commonly supposed.

In a picturesque corner of East Anglia, where a strip of watery fenland stretches up into the heath district with its sand-hills and its plantations of gloomy firs, the manufacture of flint implements has been carried on for untold centuries, probably without a break. It is true that eoliths have not as yet been found in the district, but Palæolithic man has left many relics of his presence there in the clays and sands of the Brandon beds, which lie at the top of the Middle Glacial Series; and antiquaries are of opinion that the Brandon flint-knappers of the present day are the lineal descendants of those dark-haired Euskarians who occupied the eastern parts of the British Isles when, as an Irishman might say, they weren't islands at all.

It was essential in the manufacture of flint implements to have material of a good quality and easily accessible, and as these conditions obtained at Brandon, this little town has been a place of considerable importance from a very remote period. The adjacent Ling Heath is scarred all over with shafts sunk by the Neoliths, for, although the surface of the ground was strewn with blocks and pebbles of flint, they put themselves to considerable trouble to obtain flints of the best quality. These primitive miners first dug a circular pit, and then threw out horizontal galleries, four or five feet in height, forming in some instances a perfect labyrinth of underground passages. The implements used in making these excava-

tions were reindeer's horns, the brow tine being used as a pick, and the others removed. The curiously shaped iron picks used by the flint-diggers of the present day closely resemble in shape those ancient horn tools. Within quite recent years traces of the use of these picks were plainly to be seen on the sides of the ancient galleries. In one pit recently explored the roof of one of the passages had fallen in, and on the débris being removed two deer-horn picks were found in front of two recesses, lying just as they had been left at the close of a day's work; the roof had probably fallen in during the night, and work had never been resumed there. These picks are now in the British Museum, and on the handle of one of them is plainly visible the print of a thumb in the chalky clay which adheres to its surface. 'It was a most impressive sight,' says Canon Greenwell, 'and one never to be forgotten, to look, after a lapse, it may be, of three thousand years, upon a piece of work unfinished, with the tools of the workmen still lying where they had been placed so many centuries ago.' The 'Grime's Graves' close by (whose very name indicates that they were regarded by the early English a thousand years ago as of mysterious origin) are nothing more than the chalk-pits opened by Neolithic man in order to get the flint from which they made their implements. There are about two hundred and fifty of them, varying in diameter from twenty to sixty feet, and extending over some twenty acres; one was found to have been sunk to a depth of over forty feet.

The implements found in greatest abundance in the neighbourhood of Brandon are flakes, scrapers, and adzes, together with some narrow flint implements generally known as fabricators, or punches, used for flaking, though possibly hardly adapted for that purpose, which is better served by the use of bone or horn tools. Somewhat similarly shaped flints have been found in company with iron pyrites in a Yorkshire barrow, and it is very possible that they were used for striking fire.

II.

At the present day Brandon is the only place in Great Britain where the manufacture of flint squares for guns and 'strike-a-lights' is carried on. For this purpose one particular layer of flint is found to be peculiarly well adapted; while another layer, known as wall-stone, is much in favour for building purposes. The special merits of the gun-flint layer must have been known at a very early period, for the ancient workers sank their shafts below this layer of wall-stone, which occurs at a depth of about twenty feet beneath the surface.

The modern method of making gun-flints is very interesting, and gives us a good idea of the way the Neoliths made their flint implements. The flint is found in large blocks, which are brought to the surface and stacked in heaps, and when they are sufficiently dry the knapper proceeds to 'quarter' them—that is, to break them up into pieces, each about six inches square. These quarters are then 'flaked,' or divided into strips, by means of hammers of various shapes and sizes. In the third process, called 'knapping,' the flake is laid on an iron block, and, by a steady tap of the hammer, divided into small squares, which, with a little trimming here and there, become the finished gun-flints.

At one time gun-flints were made of some twenty different shapes and sizes, to suit the rifle, the musket, the horse and the pocket pistol, and the long Danish-made guns used by the Arabs. The flints for the old 'Brown Bess' muskets of the British Army were made at Brandon, and in the early part of last century some two hundred men were fully employed in their manufacture. Few flint-knappers live to be old men, for the minute particles of flint thrown off during the flaking and knapping enter the lungs and bring on consumption.

The flint-flakes used in 'strike-a-lights' were practically identical in shape with the Neolithic scrapers, and similarly shaped flakes have been found in countries as far distant as Mexico, India, and New Zealand. In the eighteenth century a square variety was introduced into this country from France, to which was given the name of 'Frenchmen,' while the old oval flints were known as 'Englishmen.' Tinder-box flints are still being made at Brandon in large quantities.

In the palmy days of the flint-gun, flints fetched fifty shillings per thousand, but at the present time the same number can be bought for about five shillings. Brandon still ships something like three millions of gun-flints annually to Africa, China, and South America. When one remembers that in the middle of last century the flint-lock was superseded by the percussion-cap, and that matches have taken the place of 'strike-a-lights' in domestic use, the question naturally occurs, Whence arises the demand for such an immense number of gun-flints? But an answer is not difficult to find. When flint-muskets were discarded by the army, enterprising traders shipped them to Africa, where they were exchanged with the natives for ivory and rubber, and as gun-flints are but short-lived, they have, therefore, to be frequently renewed. In uncivilised countries, as well as in those countries having a very moist climate, flint and steel will probably continue in use as being the most reliable method of obtaining a light, although it is sometimes a lengthy process. Birmingham still sends large numbers of tinder-boxes to Africa and South America.

Flint and steel play an important part in the marriage ceremony of the simple Lapplanders of the present day. After the betrothal arrangements of a couple of these curiously primitive people have been satisfactorily discussed by the respective parents over a bottle of brandy, the espousals are concluded by the young folk rubbing noses. When the marriage-day arrives a priest performs the ceremony, should one happen to be available; but if not, the bride's father merely strikes a spark from a flint and steel, and pronounces the couple irrevocably man and wife. When either of them dies, flint and steel are buried with the body in order that the departed may be able to keep warm during the long journey to the unknown shore.

Flint makes an excellent building material, and the cores left over by the gun-flint maker are utilised in that way. Some very fine squared flint-work is to be found in East Anglia, notably at Norwich, that in the eastern wall of the Guildhall and in the Thorpe Chapel of St Michael Coslany being in as perfect a condition as when the buildings were erected five centuries ago.

SOME LOBBY REMINISCENCES—THE INNER AND THE OUTER.

By F. Primrose Stevenson, F.Z.S.

PART I.

I.

I AM assuming, of course, that the majority of people are fairly familiar, either personally or by hearsay, with that particular quarter of the Palace of Westminster popularly and geographically known as the Central Hall or Outer Lobby. The Inner—or members'—Lobby is a much more exclusive affair. It is on a par with the enclosure on a famous race-course, the lawn of the R.Y.S. at Cowes, or the interior of some exclusive West-End club. Admission thereto is by members only (who must accompany their visitors, and remain with them whilst they are there), save for those privileged persons who, for one reason or another, happen to have their names and the nature of their business inscribed on what is mysteriously known as the Lobby List. They include private secretaries to Ministers and members, many departmental officials, journalists, political agents, and the accredited representatives of various public bodies who, somehow or other, have made good their title to be on it. The inner lobby is the orthodox rendezvous to which they repair at will. Before the dynamite outrages it was practically open to any one who had a genuine object in going there. As the result of the Fenian campaign, however, very drastic restrictions were enforced, and these have never been abolished—only to some extent relaxed—even to the present day. To the outer lobby access is open to all who state their business. It is the sole public entrance by which constituents can seek out 'our member.' It is the parliamentary Mecca to which all with a grievance—fancied or real—can repair, and thus it is that for many years past the advocates of a multitude of causes—many genuine, some lost, and others likely to be—temperance, early closing, woman suffrage, bimetallism and the maintenance of the gold standard, anti-slavery, proportional representation, Armenian persecutions, and a whole catalogue of cognate interests—have met to discuss with Ministers and members the fortunes of their pet ventures.

This much by way of introduction. In an association, which has just closed, of a quarter of a century with the lobbies of both Chambers, I have naturally come across many such individuals. Some, like the late Sir T. W. Russell, M.P., who was working in the outer lobby on behalf of temperance interests, were recognised features of the place; others, like a certain Dr Anderson I recall, who haunted the Central Hall at one time in his efforts to right a judicial grievance in Tobago, of which he was the alleged victim, were there for a time, and were seen no more; and there was a third class among all these industrious 'strangers,' who came daily out of sheer curiosity, presumably with nothing better to do. There was, for instance, until recently, a remarkable individual, an elderly barrister, very shabbily dressed, who sat in the Lords' corridor day after day, with no other reward than to witness the coming and going of all the great parliamentarians in the Upper House. He was perfectly harmless, and the police never interfered with him in the slightest degree.

Another familiar figure I keenly remember was dear old George Smith of Coalville. His one mission in life was the introduction of a Movable Dwellings Bill to deal with the care of children who spent their early years in travelling-vans, canal-boats, and the like—and more often than not were born there—and who, therefore, could not be reached by any of the existing educational agencies. I can see the old gentleman there now with his rugged features and unkempt leonine locks. Session after session he took up his position in the outer lobby, looking for members to father his Bill if they

should happen to have success in the ballot. His work was not in vain, for before he died he had the intense satisfaction of seeing his life's work accomplished by the addition of such a measure to the statute-book of the country.

II.

It must be remembered that in order to obtain admission to the Peers' or Distinguished Strangers' Galleries of the House of Commons every one must pass through the inner lobby. Even for members of the royal family there is no other access, and both King Edward and King George, as Prince of Wales, when desiring to attend a particular debate, entered by this way in order to reach their familiar seat 'over the clock.' They were conducted to the Chief Whip's private room in the lobby—where they left hat and coat—by Sir David Erskine, Serjeant-at-Arms, who was also Groom of the Robes at Court. The present heir to the throne has entered in the same way; and there is no other for a distinguished stranger, be he a member of the foreign corps diplomatique, a celebrated visitor from abroad, or a person of eminence at home. Thus it is that in the inner lobby is focused a kaleidoscope, so to speak, of the illustrious visitors to our shores.

To give a list of all these notabilities would be a long and a difficult task. One day, perhaps, it would be Mark Twain, who visited Parliament many years ago, and beamed delightfully upon the autograph-hunter. At another time it was General Pershing, just off to the front to take control of the American armies; or it might be some distinguished naval commander, the hero of some thrilling aerial flight, the sole survivor of a great disaster, the winner of a popular boxing-match, an African bishop, the Armenian Patriarch pleading with members on behalf of his countrymen, a famous explorer—English or Danish—the members of a winning football-team, a chess celebrity, or a tennis marvel. At these times all roads lead to the lobby. One of the last I recall was a very gallant French soldier wearing two exquisitely fashioned aluminium hands in place of those he had lost in the war. He shook hands most cordially and naturally, opened his cigarette-case and handed it around, and gave other exhibitions of the triumph of science over sheer physical disability.

One of the most interesting and picturesque visitors I ever saw in the lobby was the young King of Uganda, who came to this country several years ago, accompanied by his Prime Minister, Sir Apollo Kagwa, K.C.M.G., his chief adviser from infancy, to pay his respects and indicate his devotion and that of his people to King Edward. He was the son of the notorious King Mwanga, and the grandson of the even more cruel and bloodthirsty King Mtesa, whose atrocities have probably never been quite equalled, and certainly never surpassed, among the savage races of the world. One of them was to have the wives of whom he was tired thrown headlong into his private lake so that he might watch them being devoured by his favourite crocodiles! The young king was a tall, highly-intelligent-looking man of about twenty, and his dark copper-coloured complexion was strikingly set off against a red fez cap and his long flowing robes of white. Altogether he was a most picturesque figure of a kind but rarely seen in the lobby, as introductions to Ministers and members followed in rapid succession. Two of them at least he had already met before in his capital. One was Mr—now Sir—Herbert Samuel, the first High Commissioner for Palestine, and in conversation the king at once recalled that the then member for Cleveland had given him a clockwork steamboat at the time of his visit to him at Kampala. The other was Mr Cathcart Wason, M.P., who, with Mrs Wason, toured his country some years ago, and spent much time with the young ruler and his Ministers.

III.

If the lobby has its gay moments—and they are many—it has also its pathetic incidents. One of the most distressing of these was the painfully sudden death of Mr Alfred Billson, M.P., who had received the honour of knighthood only a few days previously from King Edward, but had not yet been officially 'dubbed.' To appreciate fully the pathos of the sad spectacle, it is necessary to recast the scene as I saw it. At that time, when dining at the House was perhaps even more popular than it is now, the lobbies, between 9.30 and 10 P.M., were always crowded with troops of gaily dressed women in the height of fashion when dinner was over below. The lobby was more than usually crowded that evening, when the word went round that Mr Billson had been seized with sudden illness in the 'Aye' lobby. Members rushed to his assistance, an ambulance was hastily improvised, and upon this the fast dying legislator was reverently laid and carried to the private room of the Chairman of Committees. There was a messenger at each of the three corners of the ambulance, and the fourth handle was grasped by Mr John Burns. As the procession slowly wended its way through the lobby it was seen that the patient was beyond all human hope, and although Sir William Collins and Sir Walter Foster, two well-known medical men in the House, rendered every possible aid, he almost immediately passed away. To a close friend and companion was confided the melancholy task of breaking the terrible news to the daughter of the deceased member, who was in the Ladies' Gallery listening to the debate, quite ignorant of what had been taking place below. Then the Premier announced the sad

event to the Chamber, and the sitting was at once suspended. King Edward, with his customary tact, gave directions that the title should, under the circumstances, be used by the bereaved wife.

Upon two other occasions I can recall sudden illnesses which occurred within the parliamentary precincts, and shortly afterwards terminated fatally. One of these was the case of Mr J. Powell Williams, M.P., the close associate of Mr Joseph Chamberlain, who passed away in Westminster Hospital, whither he had been taken within a few moments of his seizure in the House; and the other was that of Dr Wallace, the well-known and learned member for East Edinburgh, who was taken ill suddenly whilst addressing the House in opposition to the money grant which it was proposed to give to Lord Kitchener for his services in Egypt, and more particularly at the final overthrow of the Khalifa at the battle of Omdurman. Dr Wallace was carried from the Chamber in a dying condition, and in this instance also Mr Burns was the first to render aid to his stricken colleague. With the experience of these sad occurrences fresh in their minds, the authorities soon afterwards installed a very complete and up-to-date medicine-chest, containing all needful surgical appliances in case of emergency, in the private room of the assistant serjeant-at-arms, and the lobby was placed in direct telephonic communication with the hospital across the way.

IV.

There are, of course, lobby *habitués* at the present day, just as there were a generation or so ago. By *habitués* I mean those members who are not actively identified with any particular movement, care but little about what is going on in the Chamber, and prefer to linger among the gossips in this *rialto* of journalism. This is far from being because they have any axes of their own to grind, but rather because they know they will become *au courant* with the latest piece of gossip or the latest good story, and at the same time make fresh friends, and renew old acquaintance with those who, after defeat at the polls, or because they have voluntarily retired from parliamentary life, are but rarely again seen in the lobbies. Indeed, until the rumours of an impending General Election are spread about, and aspirants for parliamentary honours flock to the offices of the Chief Whips, it is remarkable how few ex-members ever revisit the place in which they have spent—and probably wasted—so many of their days.

A man who exactly fits the description I have given was the late Sir John William Maclure—'John William,' as he was affectionately known among his *intimes*. He was the brother of a former Dean of Manchester. Both were very portly, Sir John a good first, and both looked as if they were not unfamiliar with the good things of this world. And here again Sir John was easily first! Indeed, the very reverend brother of the member for Stretford was often a pained spectator of the ebulliency of his parliamentary brother. Sir John, who, because of his ashy-white hair, was known under the sobriquet of the 'Whitehead Torpedo,' practically lived in the lobby, and a glance at a certain window-sill, in one of the niches of which he always placed an enormous 'topper,' was invariably an indication to the attendants who might be searching for him that he had arrived at Westminster. Sir John and a colleague narrowly escaped on one occasion a prolonged visit to the Clock Tower. He was challenged by Sir Alpheus Cleophas Morton, M.P., to appear in the lobby on an appointed day in Highland attire, and Sir John, who was in higher spirits than usual, accepted the challenge. The event, had it come off, would have kept the lobby laughing for the remainder of the day, so that all serious business would have gone by the board. Recognising the enormous physical proportions of the popular and ever-verdant M.P., and the extremely sparing way in which nature had clothed with flesh his challenger, and recognising also that if the two had met in kilts Sir John would probably have insisted upon dancing a *pas de deux* in the centre of the lobby, we need not wonder that everybody was on the tiptoe of expectation. But, alas for the gaiety of Parliament, there was a fatal hitch somewhere, and this delicious spectacle, which would have made the fortune of the parliamentary caricaturist, was never witnessed, although speculation kept its memory green for many a long day afterwards.

(*Continued on page 44.*)

SONG OF THE OLD MILL-WHEEL.

THROUGH peaceful meadows where the mild kine graze
A slender stream meanders on its way
Towards a rustic mill, whose restless wheel
In placid revolutions seems to say:
Round and round
With patient tread
I grind the corn
To make your bread.

No spurring steam need I, or booming wind,
To urge me on my errand to fulfil;
The only force that speeds me on my rounds
Is furnished by a little purling rill
That turns me in
My watery bed,
To grind the corn
That makes your bread.

Full sixty years I've played my humble part,
But now my aged frame is weak and worn;
My joints are shaky, and my members frail;
Yet still to dewy eve from early morn
I labour on
With falt'ring tread,
And help to make
Your daily bread.

THE VOICE IN THE ROOM.

By JOHN HASLETTE VAHEY, Author of *A Cry from the Heart, The Mesh,* &c

PART I.

I.

I WAS acting as *locum tenens* to Dr Fraser of Farby when old Alexander Macfarlane died. It was a little after midsummer, and the factor came for me to where I was trying for a salmon in the black pool which lies below the policies of Glencarlies House.

As a fisherman, I was loath to leave a fish which had come at my fly for the second time; but, as a professional man, I made no bones about reeling up and going with Mr Duncan, my rod still in my hand, to see my patient.

This was the first time I had seen old Macfarlane in that capacity, for he was a grim, tough old man, who boasted that he had never had a day's illness in his life, and swore, in his sour way, that he owed his long life to his freedom from medical supervision. In short, he was one of those misguided individuals who come into the world with a doctor's assistance, and are glad enough to seek his help to avoid going out of it, but scoff at him between whiles.

I left my rod standing against the wall of a byre as I passed through the outbuildings, and found Macfarlane lying on a couch, his neckwear and coat undone, his face flushed. One look at his hard face, his full neck, and dull eyes told me that he had called in all too late the services which earlier might have served his turn. I did what I could, had him to bed, and sat down by him to watch, while one of the servants went off post-haste to Farby for some medical requisites.

Macfarlane was silent for a long time; then, at last, he seemed to revive in some measure. His eyes brightened, he called all his waning nervous energy together, and looked at me full in the face.

'You 've come to crow over me, who had no use for doctors at any time,' he said harshly.

'I have come to do what I can,' I said.

A grimly humorous gleam came into his eye. 'To write a certificate, man! I know. I can stand a clout with any man, and I know when I hear my name called.'

'We may make something of you yet, Mr Macfarlane,' said I.

'A corpse,' said he with gravity. 'I've had a long run, and I am out of breath. It isn't this life I mind leaving so much as this place.' I said nothing. He firmed his under lip and went on: 'Ay, this place; and I wouldn't mind that but for him I have to leave it to.'

He may have been going to say more, but he sank back as he finished the words, and I was too busy trying to keep life in him to think of much else the next half-hour.

He never spoke again but once, and that a few seconds before the breath went out of his body. It was night then, about eleven as I made it, and he sat up on his pillows with an effort, while a last flicker came into his eyes.

'May ye never be happy in it, Tod, for the way ye served me!'

I heard his words with dismay, for the last hours of a man should be given up to blessing rather than cursing; but again I had no time for comment. He fell back, and Glencarlies House was without a master.

Perhaps it was because I was courting Dolly Fraser at that time that the scene made no lasting impression on my mind. When matters of life and death are on hand, it is always the matter of life that absorbs the interest of a normal and healthy man. And as I was not very sure if Dr Fraser took the same interest in me as a prospective son-in-law as did Dolly, the course of my young courtship soon diverted from my mind the alien question of the heirship to Glencarlies House.

Now, whether it was the natural tendency of an attractive young woman to keep an ardent man on tenterhooks before surrendering, or whether fear of her grave father hindered her, at all events I found Dolly in the mood to make me hasten slowly. I was still at Farby after the natural termination of my *locum*, discussing with Dr Fraser the question of partnership. He was getting old, and disposed to take the rest of his life more easily, and I was attracted by the prospect of extending a promising practice and arranging a happy marriage.

Dolly fished with me, walked on the moors, and was not above taking a ride in my little car; but when it came to actual love-making, I found myself deftly, if sweetly, deferred.

 [*All Rights Reserved.*]

'I hear Macfarlane's arrived,' said Fraser to me one morning about two months after the old man's death.

'Macfarlane?' I said. 'Do you mean Tod?'

He looked at me curiously. 'And how do you come to know him by that name?'

'I heard Mr Macfarlane speaking of a "Tod" as the man who was to succeed him.'

'Did you indeed? And how did he speak of him, Dr Hyde?'

'As I might speak of a man who had done me a weighty injury, which I had neither forgotten nor forgiven.'

Dr Fraser nodded. 'You're right. Glencarlies goes to Robert Macfarlane, who was called "Tod," in spite, by the late Alexander. The old man was in love with the lady who afterwards married his brother, and this Robert, or "Tod," was the son of the marriage. He was an engineer when he left this country, ten years ago, and went to Chile—to some mines, I think. Alexander never forgave him for being the son of any one else but himself.'

'Hadn't Alexander been an engineer, too, before he retired?'

Dr Fraser shook his head. 'An amateur he was till the day of his death—not in regard to proficiency, but that he made nothing out of it. He had skill and invention. They say he might have gone high had he followed it up. There's a workshop up at the house that is an interesting sight.'

'So he invented, then?' I said interestedly.

'Ay. He had twice the brains of his nephew, and a grand knowledge of electricity, and wireless, and other things of the same kind.'

I nodded. 'And this Robert—what sort of fellow was he?'

'A bitter man, though he had the looks of an angel. He lacked money in his youth, and that soured him. He had the temper of a fiend, and Alexander and he struck sparks out of one another many a time. He thought somehow he ought to have had some of his uncle's money to help him, and when he found it refused him, he was never done taunting the old man about the way he was done out of the woman he loved. It's strange, but true. He would drive Alexander, his uncle, into the foulest rages by just mentioning his own mother with a kind of smile.'

'He was handsome, you say?'

Dr Fraser got up. 'As an angel—though that temper of his may have taken some of the fine lines out of his face before now.'

II.

It was just four days after that, when I had a morning to myself, and managed to get Dolly Fraser to share it, that I heard more of Tod Macfarlane. We had taken our rods up the brook which runs into the river above the village, and were preparing for our sport when Dolly gave me an arch look.

'I saw an angel to-day!' she said.

'You must have been looking in the glass, Dolly,' I ventured.

'I was looking in a glass right enough, but it was the plate-glass of Porter's shop, when I went down for dad's paper. He came up to look in.'

'That will be Macfarlane,' I said, with a slight twinge of jealousy. 'But from what your father says he must be Lucifer—one of the fallen angels at best.'

'He was a fine man, and very handsome, let me tell you. But I may grant he had a temper, for his eyes were fierce.'

'I hear he's been on the Spanish Main, or somewhere,' I scoffed. 'No doubt he thinks he's a Spanish grandee. Had he upturned moustaches, and a knife in his belt?'

Dolly laughed. 'You can't bear to think there's another handsome man in Farby!' she said with a smile. 'Better than that, though. He was going in to see Mr James—about the estate, I suppose—and Mr James came out when I was passing, and introduced him to me.'

'Mr James has more spare time than spare sense!' said I.

'Shall I put on a Greenwell's Fancy?' said Dolly, evading the issue, and giving me the hint that there was no need for us to quarrel, even over an angel.

I think it was the little twinge of jealousy that spurred me to a new interest in Tod Macfarlane. I was deeply in love with Dolly, and even an unprejudiced outsider would have said that she was pretty enough to awaken the interest of a handsome gentleman, with his amorous faculties no doubt stirred by some passages with the ardent women of Latin-America. So I was anxious to get sight of the man himself, accepting the grave Dr Fraser's estimate of his looks as being a justification for Dolly's praise.

But five more days passed before I saw him. I was casting again in the black pool below the house (as I had been just before I was called up to old Macfarlane), when I hooked a fish, and saw Tod for the first time.

I was too busy then to pay attention to him, but soon I knew him as a cross-grained ruffian, who looked like a bit of antique statuary. He had a fine face, if spoiled by temper; a tall, erect figure; and a voice that would have charmed birds off a bough. I had never seen a handsomer man, or one whose face was such a mask, covering a brain that seemed full of falsity and malice.

He came up to me as my fish was jigging under the far bank, and spoke to me as a poacher may to his dog. 'Come out of that, my man!' he said. 'You're poaching on my water; and I'll just take your rod and tackle, if you please.'

I turned to look at him, keeping a firm hand on my fish all the same. 'I had permission from the late Alexander Macfarlane,' I said briefly.

'If there is fishing where old Alexander's gone, I doubt he's more busy with the water than with the fish!' said he cruelly. 'My uncle has no more right to give you permission now than King James the First, so hand over your rod.'

I said nothing. His tone made my rage boil over. I would not give him my rod; and as for breaking with a twenty-pound fish, now showing signs of exhaustion, that was not to be expected. 'Wait till I land my fish, and then I'll talk to you, sir,' I said, and began to reel in, while I watched the lather of foam in mid-stream.

I could hear him give a gasp of rage, and then I felt a hand on my rod. I snatched it away, and in so doing struck him lightly with the butt. He went a pace up the bank, and then charged down at me like a mad bull.

I had all the shifts of a trained boxer, and half-a-foot to one side was enough to slip him. He couldn't stop himself, and the next moment he went splash into the water, and I had to lay down my rod and reach a hand to him to pull him to dry land.

He was wet to the skin, his face black with rage, and spitting out water and curses together when he got on the bank beside me.

'I am sorry, but it was your fault,' I said. 'If you had waited——'

'Wait, be d—d! You swine!' he yelled at me. 'I'll teach you to be on my water. Ay, and if I had you where I've come from I'd put a knife in you, you dog!'

'If fists will serve,' I said, hot at his language, 'I am quite willing to try you out, though I warn you that it's not of my seeking, but your own.'

An account of one fight is very like that of another, but this was a fiercer mix-up than any I had ever had the misfortune to get into, even in my student days. Macfarlane was a madman in temper, and full of tricks that serve better to win applause in rougher countries than ours. He hit, of course, when I let him; but he had other ways of offence, perilously like gouging and butting, which made my gall rise.

He was as strong as I, but not well tutored in legitimate boxing, and after the second attempt summarily to put my eyes out, I measured him with my left, and drove my right under the point of his chin with all my force. I lifted him off his feet with that, and left him neatly laid out on the bank.

I bent down and examined him. It was a fair knock-out, and would do no lasting harm, so I took up my rod, landed my salmon, which was still on, and had it in my hand as he opened his eyes and sat up.

'I got a fish for you,' I said, thinking it was his fish after all, and bearing no malice now I had beaten him. 'I have no wish to fish any one's water when I know it is closed.'

He got up in silence, glared at me, and felt his chin. Then he approached a pace to where I had laid down the salmon, and kicked it viciously back into the water. 'Let that go where it belongs!' he said, with an evil look at me.

There was little use in arguing with a man of his temper, so I bowed and left him. The old man, his uncle, had been generous with his permission, but it was evident that the nephew meant to conserve his rights rigidly.

Mr James, who was one of the old man's lawyers, met me as I went back through the little place, and it seemed to me, from what he said, that Macfarlane had a charm about him when he pleased, and had taken the trouble to exercise it.

'A fine fellow!' said James to me. 'I like him well.'

It was not for me to tell the upshot of the scuffle by the river, especially since I had come best out of it, so I smiled, and said that Macfarlane was evidently a keen angler, and meant to keep the river to himself.

'There's been over much poaching,' he replied. 'I can't blame him if he likes a bit of sport to himself on his own waters.'

Now James's opinion, since he was Macfarlane's lawyer, and stood to profit, did not appear to me to be worth much; but I was surprised, and annoyed too, when I discovered that Dolly had fallen somewhat under the fascination of the man. Macfarlane had evidently lost no time in finding the doctor's house, and called on the afternoon of the following day.

'Some one told me he had had a fall and hurt his chin,' I said, piqued by Dolly's enthusiasm.

'He said something like that had given him a bruise,' said Dolly.

If I had been less of a fool in these matters I should have told her what had happened, and thus given her an insight into the character of the man; but, as the victor, I felt bound to be magnanimous, so I smiled and said nothing.

III.

I think it was a week later when Dr Fraser spoke to me about old Alexander Macfarlane's will.

'That was a cranky old fellow, as I told you,' he said. 'James tells me the testament contains some provisions that would have made me doubt the sanity of the testator, if I hadn't known him for the hard-headed person he was.'

'Something out of the common?' I asked.

'Quite. The place goes unconditionally; but a good bit of money with it, necessary for its upkeep, is conditional on young Macfarlane occupying the house himself from Lammas till Candlemas, sleeping in the room formerly

occupied by his uncle, and seeing that the big wag-at-the-wall clock on the landing without is kept regularly wound by Ferguson from the village.'

I laughed outright. 'Certainly that seems a mad condition.'

Dr Fraser shook his head. 'Yet there was something about old Alexander that makes me think,' he said, as he rose. 'He was a man of form—a man who did little without a purpose, though what the purpose of this may be I can't tell. Have you met the nephew yet?'

'I had a short conversation with him.'

'He called here,' said the doctor. 'I must say I was favourably impressed. He has excellent manners, and is full of information. A broad-minded, travelled man.'

From that moment Macfarlane and I were rivals in mind, if not openly; and from what I heard all around me, I was the only one to whom Macfarlane had shown a trace of his temper. Why? That puzzled me, I admit, until the idea crept into my head that he had admired Dolly from his first glimpse of her, and had heard something in the village about our intimacy.

The only thing that might seem to be told against him in the village was his superstition, but in the village itself superstition was rampant, and seriously frowned on only by the minister. Life in a Latin-American country had imbued Macfarlane with all the fears and bogies of an illiterate, simple-minded people.

'It seems so strange in him, too,' said Dolly to me, after relating an instance. 'I thought bogles and spirits and things of that kind were laughed at by grown men of education.'

'So they are,' I said. 'For Heaven's sake, Dolly, don't tell him that Glencarlies is supposed to be haunted!'

'Oh, he knows that. He lived there as a boy. Indeed, he has half a mind to believe that his uncle left him the house hoping he would get a good fright in it.'

'What a fool he must have thought his uncle!' I said. 'The old man was not of that fibre.'

The next few months were months of irritation to me. Macfarlane continued to call, and he invited Dr Fraser and Dolly up to dinner every fortnight at Glencarlies. I was foolish enough to be stung by this acquaintance, and to reproach Dolly with allowing the man to make up to her, and the natural result came of it. Dolly was too spirited to be kept in leading-strings; she resented my interference, and seemed to give some countenance to Macfarlane's advances.

I threw myself into my work with greater energy than ever, to forget what I could not hinder, and when October came in I was established as Dr Fraser's full partner at Farby.

And Dolly was still unrepentant, as it seemed.

The character of the man being apparently hidden from every one but myself, I was wise enough to keep my opinions to myself. It's a foolish thing to be the only one to condemn a popular new-comer, especially when it is known that you have cause for jealousy of him. So I suffered the pains of hell without the possibility of finding a cure for them, or an opportunity of giving vent to my feelings.

Macfarlane knew it. We had to meet sometime, no matter how formally, and then he would favour me with a smile of the sweetest, under which only my own initiated eye could detect the triumphant malice in his soul.

I saw less of Dolly those autumn days. Whether to tempt me, or because she really was under the spell of the man, I could not tell till long after. But the pleasure of her company was now often his where it had been mine before his coming, and though Dolly still spoke to me sweetly enough, my offended pride brought a new stiffness which she could not help seeing. Jealousy is a foolish thing at best, but never more foolish than when it makes a man awkwardly conscious of what he thinks his rights.

In these circumstances it would be thought that it was my part to droop and lose colour, and Macfarlane's to grow strong and happy under the encouragement of her smile. But I seemed to thrive better on the husk than he on the kernel. My health was founded on a sound constitution—an obstinate thing that resisted all the effects of my daily mortification. With Macfarlane it was another matter.

When he first came to the old house of Glencarlies he was tanned with tropical suns, a full-blooded, sanguine man, sturdy, fresh-coloured, and well set-up; but between the Lammas and the Christmas of that year I noticed a remarkable change in him, for which I was unable to account. It was not only that he lost flesh, but his face lost its colour too, and lines began to show themselves in it which gave him a curiously haggard appearance, like those of a man who thinks too much or sleeps too little.

Dr Fraser saw it too, and spoke to me of it one morning in early December. 'I was up at Glencarlies last night for dinner,' he said suddenly. 'What ails that man, do you think?'

I started. 'You've seen it too, then?'

He nodded. 'And Dolly, and indeed everyone, is talking about it.'

'Perhaps he finds Glencarlies unhealthy after the tropics?'

'I don't know that. Between you and me, it seems as if the man had a fear on him. He begins to talk of his old uncle—though it is difficult to see what he has to do with it, being where he is.'

'I hear he's superstitious; and then Glencarlies is a weird old place for a man who worries over much about signs and portents.'

Dr Fraser smiled. 'Yes, he's almost childish in some of his superstitions. I put that down to living among the Chilean miners so long.

Presbyterian as he's supposed to be, I believe I've seen him cross himself secretly when anything happened like spilling the salt.'

I nodded. 'Does he complain of anything in the old house?'

'He says there are noises.'

'There would be in any old place with ancient timber, and a goodly complement of owls and mice.'

Dr Fraser agreed. 'But this is more than a joke for him. He's losing flesh fast, and there's something in his eyes I don't altogether like.'

'Did you offer to prescribe for him?'

'I did, but he would have none of it. Talked some nonsense about things of the flesh and the spirit being different. I hope he'll soon get over that nonsense.'

(*Continued on page 59.*)

SIAN-FU IN THE LAND OF SINIM.

By H.S.H. THE DUKE OF XENSI, LL.D.

I.

A BIT out of breath and a trifle tired we reached the summit of Li Shan, the mountain-spur that rises just behind the historic thermal baths at Lintung-hsien.

Late in the afternoon we had arrived, ahead of our caravan, at Lintung, alleged burial-place of the imperial builder of the Great Wall.

We sent our Chinese cards to the magistrate, and were accorded his permission to enter the grounds of the ancient thermal bath. The water that bubbles up from under the Li Shan, the Kwen-Lun tentacle that shields Lintung from the gales out of the plain of Sian-fu, is more than a hundred degrees hot; so on a day when you have given up measuring temperatures already before noon, because the roasting Chinese summer had then registered one hundred and fifteen degrees F. in the shade of the persimmon-tree, under which you were resting for a moment, it feels like heaven to get into the big, cave-like stone bath and play around in the water to your heart's content, even with an interested Chinese audience.

Frank Cavendish and I, who had been travelling together by native house-boat and caravan for more than a month out of Peking, took a new lease of life. We had been some fourteen hours in the saddle that day, but we had enjoyed no anticipatory pleasures as to the thermal baths at Lintung. As a natural consequence, the result of the surprise bath—for bathing is not so frequent during trips in the interior of China as it is on the banks of the Thames—was delightful and energising to the extent that we decided to climb the 'hill,' as Frank termed Li Shan. We knew that Sian-fu might possibly be seen some sixteen miles farther west.

On the top of the mountain-spur we were amiably greeted by an elderly Taoist priest, who offered us refreshments as soon as he noticed our lack of breath, and we delighted in his weak tea and brown Canton sugar.

Some years earlier we had been together on one of our perennial political missions, from Peking into outer Mongolia, where we had incidentally rescued a too curious Japanese colonel from the Hutuktu's inhuman prison, and we had visited other places in the interior of the then Chinese Empire, but the Foreign Office had never ordered us to Sian-Fu. This had disappointed us, for we well knew that the ancient classical capital of the Land of Sinim was infinitely more interesting than Peking or any other city in the entire Far East. When thereto was joined the comparative inaccessibility of Sian-Fu, not forgetting the fact that few white men ever went there, Frank and I were in great good-humour that our investigations for His Majesty's intelligence service had this time, at last, brought us into the centre of the most historic part of the empire.

Beyond the little Taoist temple on the Li Shan, where we had enjoyed tea with the priest, the mountain-spur ran but a short distance farther north before it suddenly inclined steeply to the plain of the province that is known to foreigners as 'Hidden Shensi.' And from our lofty place of observation—through our field-glasses—we could discern quite plainly, in the golden haze of a slowly disappearing sun, the four majestic gates, the tall pagodas, the massive bell and drum towers, and the imposing walls—all part and parcel of our goal: Sian-fu, that means 'Western Peace.'

The next morning we slept longer than usual. It had been the custom of our caravan to start on its western way between three and four o'clock in the morning—sometimes earlier, when the distance to be covered was more than twenty miles. But we were nearing our goal after a certain amount of privation, so we slept a little later. By six, however, Frank and I were having a wonderful time together in the cave bath, behaving like a couple of crazy schoolboys, and indulging in all sorts of silly antics.

'Your conduct must be the result,' I teased Frank, who was scrubbing himself all over with amazing energy, 'of having slept in the dowager-empress's discarded bed. The distinction has unhinged you!'

Frank jumped at me and ducked me mercilessly.

At last we started westwards, but that day we did no more than thirteen miles.

Towards sunset we arrived at the village of Chi-li-pu, three miles east of Sian-fu, and Frank decided that we were not, after these many years of anticipation, to make our entry into the Tang dynasty's capital in the twilight of gray shadows, but in the blinding glory of the following morning's sunshine. I thoroughly shared the view, which was more than I could say for the caravan leader and his muleteers. They were sullen at the prospect of another and unnecessary day's journey, but we pacified them in the way that never fails.

Chi-li-pu is a queer little village. Half of the community, at least, lives in caves dug into the loess, while the other half dwells in huts and houses on top of the steep loess walls that here face east. It was hard to find an inn worthy of the name, for the proximity of Sian-fu made caravanserais somewhat superfluous. However, we managed somehow. We always managed, when we had to.

II.

Before daylight the following morning we rose from our hard camp-beds. We had slept in a loess cave—the state suite of Chi-li-pu's foremost hostelry. Next to our unventilated but cool cave was a smaller, into which one might walk through a low opening. I did. There I encountered our nearest neighbour during the past hours of sleep. It was a corpse in a black coffin on its journey back to the point where the deceased had started life.

Early that morning we went down in front of the high loess wall of Chi-li-pu, and waited for the sun to put in an appearance. As soon as he did we photographed the remarkable village of caves, and the result proved well worth the extra trouble involved.

Then we joined our caravan, which had been staying uphill overnight in another 'inn,' and started for the old capital. About seven in the morning we entered the east suburb of Sian-fu, Frank and I on pony-back, the rest of the caravan in carts of springless make, or on foot.

At a turning of the road the tremendous east gate of the ancient capital suddenly towered above us. A few minutes later we rode under the triplex gate-structure, and in the outer vat-like enclosure we were asked by the guard—he was armed with a broom-stick, while an impressive collection of halberds of grotesque designs was exhibited in a stand close by—to show him our Chinese passports. That we declined to do, on the ground that he ought to know that no white man could have penetrated unmolested so far into the interior of China without a very definite passport from the Wai Wu Pu at Peking, and also owing to his complete absence of rank.

However, we told him through our interpreter that we intended sending our passports to the governor's *yamen* for His Excellency's minute inspection—which promise did not in the least seem to satisfy the sentry and his superior officers at the guard-house.

The four huge gates and the walls of Sian-fu were in remarkably good repair. The reason is simple enough. In August 1900 the dowager-empress and her nephew-emperor fled from Peking to the ancient capital of the empire, Sian-fu, now the provincial capital of Shensi. The Boxers and the advancing allied troops had made it too hot for her in Peking.

Tuan Fang was then viceroy over Shenkan, and he at once moved from Kansu to Shensi, so that he might be at the service of the distinguished visitors. Among many other things, he ordered walls and gates to be put into parade condition, and that task was very well done.

The two larger *yamens*, or official residences, in the city were repaired, cleaned, painted. One was intended for the empress, the other for her nephew. When she arrived, however, she decided to occupy only one residential compound, the Peh Yuan, or North Court, which—Tuan Fang honestly told her—was haunted. But Her Majesty did not mind that.

For nine months the imperial Court remained at Sian-fu. The temporary capital of the empire, which had been the metropolis throughout the golden literary and artistic age during the reign of the illustrious Tang dynasty (A.D. 618–907), became world-noted again overnight, for the imperial edicts that were usually issued daily from Peking, and which at that time thrilled the world because of the Boxer Rebellion, were now promulgated from Sian-fu, far in the interior of the Middle Kingdom.

The result was that the European and the American press wanted to know something about Sian-fu, but their failure was conspicuous to a degree, until the *North China Herald* of Shanghai had a pamphlet printed on the city by Dr Hogg, a missionary who had been there. Even this valuable brochure was a bit misleading, for Sian-fu was spelled Hsian-fu. The city's name, at that time and even now, is variously and erroneously written Segan-fu, Sigan-fu, Hsian-fu, Siyan-fu, and what not; while the fact of the matter is that the late Sir Robert Hart and his imperial posts laboriously Romanised hundreds of city names in China, selecting for the spelling of the capital of Shensi, Sian-fu. Thus it could not be confounded by aliens with Tsinan-fu in Shantung, and other cities of similar nomenclature.

We were told in Sian-fu that the imperial family never left the residential compound of the Peh Yuan during the nine months' stay at Sian-fu. It must have been trying for them. After much persuasion, we were permitted to visit the locked and barred residence of the imperial fugitives; and indeed the buildings and the gardens were but small and modest, and even cramped compared with those of Peking.

Weeds were growing everywhere in the yards and the park, and things generally were falling into decay. Since the residence of the Court the buildings had automatically become sacred, and no one, except the care-taker (who took no care) and the governing mandarins, was allowed to enter. However, additional fees mollified the Cerberus to the extent that we were enabled to take a photograph or two.

The temporary throne-room of the melancholy emperor, Kwang Hsü, and the sleeping-quarters of his autocratic aunt, were perhaps the most interesting features. Everything had been left standing as it was when the Court returned to Peking half-a-dozen years before. The throne of yellow silk, the priceless Chien Lung rug in the council-room, the carved bedstead of the dowager-empress, its red satin coverlet, the magnificent *lang-yao* vase, and a few Ming incense-burners on an inlaid table near the bed, the stand built over the fish-pond in the park, even a foreign glass door or two—everything bore testimony to the former existence here of high authority and attempted splendour, incarcerated within the narrowest of physical limitations.

III.

To render a detailed description of one of the world's most fascinating cities within the scope of a brief magazine article is manifestly impossible. Sian-fu is worthy of at least a two-volume book.

But I shall venture to revert to some notes, made on the spot during our month's stay in Sian-fu, in order to give you some kind of a picture, however inadequate, of the ancient capital of the Sons of Han, a city that houses, even to-day, hardly less than eight hundred thousand souls.

Like most northern municipalities in China, the entire city is enclosed by a wall—in this case a structure that is outdone only by that encircling Peking. Sian-fu's impressive wall is some thirty-five feet in height, and certainly ten miles in circumference—the city being built in the shape of a parallelogram of, roughly speaking, three by two miles. The crenellated wall is fortified with numerous watch-towers and tall corner-towers; while the four gates, as indicated, are surmounted by huge structures of brick and stone with immense roofs that rise some eighty feet into the air, and can be seen from far away in the surrounding country.

At the west gate are found some deep ancient wells that supply the population with drinking-water, peddled about on wheel-barrows by coolies, who make a living in this moist way. Wells in other parts of the city are impure and less deep, so that their water is used for other domestic purposes.

The two main arteries of traffic, the streets respectively from the north to the south gate, and from the east to the west gate, cut the provincial capital into four natural parts.

The north-western part is the Mohammedan quarter, and here lies the oldest mosque ever built in China. In this section of the city live the immigrants from the overpopulated province of Szechuan towards the south-west, and, of course, the strictly Mohammedan community which holds itself apart, even aloof, from the Chinese.

The Chinese Mohammedans—and there are some fifty millions—themselves say that they arrived in the empire centuries ago as the mercenary bodyguard of some distant ruler, who employed them as do the popes their Swiss Guard, as did the Byzantine emperors their Varangian Guard. This origin sounds true enough, and even to-day the Mohammedans in China are mostly military men. At least they are militaristic, and they seem to look down upon the peaceful Chinese. The many Mohammedans that we had occasion to observe at Sian-fu, notably around the mosques, distinctly possessed Semitic facial traits. The women were not veiled. The Mohammedans were, are, and will remain distinct—just like the few remaining Chinese Jews at Kaifeng-fu, in Honan.

For some reason or other, which we were not able to fathom, the Mohammedans of Sian-fu took no part in the great Moslem Rebellion (1860–72), and consequently Sian-fu was saved from destruction, while the surrounding country for hundreds and hundreds of leagues was laid waste and mercilessly pillaged and plundered, as were, half a century later, Belgium, Serbia, and Poland.

The north-eastern part of the city is the Tatar or Manchu quarter, encircled by an inner wall. After the Manchus conquered the Chinese, A.D. 1644, it became the fashion under the Ching emperors to maintain Tatar garrisons in all the larger cities of the realm. Such a garrison implies, of course, a whole Manchu community, including wives, concubines, children, servants, servants' servants, and many other species of grafters and hangers-on, legalised and otherwise, who are the inevitable flotsam on the current of power. It would be difficult to imagine anything more haughty, lazy, cruel, and good-for-nothing than the so-called Manchu garrisons in Chinese capital cities of yesteryear; and it is a good thing that the Chinese republican Government got rid of the nuisance in short order.

In the Manchu section there was plenty of leisure and of room. The streets were in a frightful condition, as all municipal grants went for graft.

Passing into the Manchu quarters from the Chinese city is like leaving Wall Street behind you and entering Trinity Church. And yet space and silence are still more emphasised when, after a short walk, you enter the extensive

enclosure—likewise separately walled—inside the Tatar city, which is now given over to pasture, and occasionally military drill for old-time troops, but which once, during the glorious rule of the Tang emperors of old, held the most magnificent constellation of imperial palaces, parks, pavilions, artificial lakes, stables, and temples that the East has ever seen—an enclosure which, some day in a not distant future, will yield archæological treasures that can be compared only with those of Rome.

The south-western section of Sian-fu is largely residential. Here we saw a number of fine, almost palatial, compounds, shaded by beautiful trees. A multitude of retired officers and officials live here in order to enjoy that *otium cum dignitate* which Cicero mentions, and which may, or may not, have been earned.

This part of the city also harbours the *yamen* of the governors of Shensi, the Peh Yuan lying a little farther to the north-east. At the time of our visit the governor was a disgruntled old man called Chao, whom I met once or twice in the streets as he was carried by with hectic haste in his green sedan-chair. In an official letter which he had cause to send us in connection with our investigations of certain phases of political intrigue against China by another Eastern Power, this old and extraordinary representative of the dowager-empress, who still ruled China during our trip, answered in a formal note that, unfortunately for himself, he could not grant the request for a personal interview because 'His Excellency would not allow a white man to behold his countenance, which had been rendered unbeautiful through the immoderate use of wine and the intemperate smoking of opium.'

After meeting the governor in the street, Frank and I agreed that his self-characterisation was conservative. We were fortunately able, however, to transact our official business with Fantai and one other official.

The outer courtyard of the governor's *yamen* forms the central market-place of Sian-fu. It is a veritable bazaar, and a busy life may be watched here from sunrise to dark.

Hawkers, dentists, astrologers, money-changers who sell you copper for silver, or *vice versâ*, palmists, theatrical shows, story-tellers, quack-doctors, notion-peddlers, candy-stalls, corn-cutters, drug-counters with the most unmentionable medicines that man ever devised, gangsters, grafters, soldiers, oculists, and others do an unremitting trade here all day long. They victimise the city dwellers, but particularly lean, as do their colleagues in other lands, toward the simpler brethren of agricultural persuasion who 'come to town.'

People jostle one another; some swear, while others laugh; and among this feverish crowd, not entirely unlike the one that Jesus drove out of the Temple, we find three or four timid native-born missionaries of some Christian denomination or other, who, armed with a portable organ, so well known from minor Chautauquas in the States, sing aloud holy hymns, to the marked consternation of some, and to the equally great amusement of others.

Suddenly the crowd is dispersed by scarlet-coated soldiers on the run. They shriekingly proclaim the names and titles of a mandarin, who is being hurriedly carried by in his closed sedan-chair; while numerous coolies run along with signs painted in red and gold, rendering the dignities of the occupant of the swinging chair, preceded by his umbrella of authority, and followed by several retainers on ponies with shaggy manes and fiery eyes.

Again life sweeps on in the gubernatorial square, where the mob listens open-mouthed to the story-tellers, glares at the marionette-show, and looks wonderingly at its psalm-singing countrymen and their quaint music-box.

IV.

The south-eastern section of Sian-fu also contains a number of fine residences, but here we find first of all the better artisans and shops of the provincial capital. Last, but far from least, we find here the Peilin.

The Peilin, or 'Forest of Tablets,' will do much to make the ancient capital an international place of visit sometime in the future when the railroad reaches Sian-fu, for it forms one of the rarest collections of inscribed tablets and monuments in the world. Needless to say, the wonderful state of preservation of the inscriptions is one of the main attractions to the student.

Among the treasures in the Peilin, which is situated not far east of the south gate, is a pictorial presentation of Confucius on stone, a great rarity, for in the Confucian temples all over China there are no idols, no pictures, or anything else that might distract attention from the main reason why a worshipper should enter a house of religion.

It is probably on account of the association of the great teacher with the classics of China, which are inscribed *in extenso* on stone in the Peilin, that his image has been set up here.

The Peilin also, since 1907, shelters the Nestorian Monument, one of the world's three or four most important documents, set up in A.D. 781 by the first Christian mission that entered China. Fourteen years ago the Danish explorer, Dr Frits Holm,* made two pilgrimages to Sian-fu. His expedition resulted in the Nestorian Monument being put under roof. Dr Holm's two-ton replica of the priceless monu-

* Early in 1921 the Hon. Frits Holm, G.C.O.M., LL.D., presented to the Government of India, through Lord Chelmsford, a reproduction of the Nestorian Monument to be placed in Calcutta.

ment which, in the teeth of 'unspeakable difficulties,' according to Professor Kuwabara of the Kioto Imperial University, he transported three hundred and fifty miles to the railroad, has since been permanently placed in the papal Christian Museum of the Lateran Palace in Rome.

The shops, free from doors all the year round during the hours of daylight, as well as the workshops of the better artisans, are most attractive in the south-eastern quarter of the city, and in parts of the two main streets, and you find a bewildering multitude of native goods for sale.

Of course, since no tourist ever yet ventured to Sian-fu, trade is of an innocent nature; in fact, one may yet pick up wonderful curios and coins in the shops for a mere song compared with London or even Peking prices. There is jade from Turkestan, turquoise from Tibet, coral from India, silk from Canton, tea and other essentials from the Yangtze valley, tobacco from Szechuan; there are shops where pieces of redwood, that make you sneeze, are turned into stands for art-treasures or into carved boxes; there are undertakers that create roomy caskets of heavy planks; and there are lapidaries, fur-dealers, shoemakers, and high-class food-shops for the wealthy, in front of which you may observe a live carp swim around—a bit sluggishly—in a tub.

But the disease-infected, malodorous beggars and the heat urge you along. It is hard to go 'shopping' even in Sian-fu with the thermometer going over the top.

Above the very centre of the city, where the two main streets cut each other, and where the absence of a traffic policeman is keenly felt, rises the bell-tower. Like the near-by drum-tower, it is of red-painted wood, and from its top may be had a most wonderful view of the city and the surrounding stretches of Sian-fu plain, with the two pagodas toward the south and the many mound-like imperial graves toward the north.

The worst features of Sian-fu were perhaps the heat and the beggars. It is hard to say which of the two proved the greater tribulation. They seemed interlinked in a way. Also, of course, it is not conducive to comfort suddenly to be transplanted, as it were, into a mediæval community, where things that to us seem essential are not thought of.

After a month Frank and I travelled forth again. We had finished our delicate task, and we had not been found out.

We stopped at Lintung-hsien, within the enclosure of the thermal baths, for three days on the way home, thoroughly enjoying the rest. However, we promised ourselves a longer holiday after our many privations as soon as we were back on the China coast, whither we were bound—that is, as soon as our reports had been despatched to the Foreign Office in the diplomatic pouch.

MAN'S WORK.

CHAPTER II.

I.

THE Enterprise Oil Company came before the public a month later. Brooks heaved a sigh of relief and exhaustion when the eastern papers arrived, containing a flamboyant advertisement that stock could be purchased at ten cents. These advertisements, the result of their joint labour and night after night of revising, seriously depleted the partners' cash reserve. Brooks, consulting his bank balance, estimated that he had not more than six weeks' expenses actually in hand. Sitwell was better off.

The matter imposed on the older man a greater strain than he realised. The thing had been done, and done successfully, before; but this time it seemed that a new factor was introduced—one in which Claudia, Shanklin, and Sitwell were all involved. He tried to put Shanklin out of his mind, especially now that Sitwell, the coast being clear, had renewed his advances; and Brooks chuckled, observing how well his partner played his game. He respected Sitwell's shrewdness, and there would be a distinct advantage in having him look after the girl's interests later on; but beyond this it seemed that, after all, there had been something about the lawyer one missed in his rival—something youthful, promising, and, in a way, steadfast. How curious it would have been to have a partner who did not allow one to stray from the narrow path!

Sitwell in truth went about it carefully. He loved Claudia as far as his calculating nature allowed him to love any one but himself. What he did, he did with grace and finish, suggesting always that such was the atmosphere in which his wife might expect to live. There was a side of him that Claudia never saw—and it is a question whether Brooks himself ever understood his partner—a side that revealed the callous ruthlessness of his mind. Sitwell was dangerous because he did nothing without a reason, and doubly dangerous because the reason was so rarely in evidence.

Slowly Claudia began to yield, to regard the years by which Sitwell was older than herself as being of little moment. She had never understood her father's business, because he had never explained it. She knew that he was

interested in oil and held certain stocks—and that was all. She looked upon the Enterprise affair as something normal and natural, and not in any way did she connect it with Shanklin's disappearance from her home. Money seemed to come easily, and she spent it with full confidence that the supply would be maintained. She was the product of her surroundings and heredity—proud, beautiful in a wild, sweet way, impulsive and generous, and, above all, she loved her father and the memory of her mother.

A week after the first advertisement appeared inquiries for Enterprise stock began to dribble in from the east. The company had sought no publicity in California. Brooks was too wise for that. Nor did he anticipate any unfavourable criticism, there being a feeling in certain speculative circles that it was good business to move money from the Atlantic to the Pacific on any old pretext. But for some reason Enterprise stock hung fire. Applications were for one hundred shares upwards to a thousand, and Sitwell's desk was littered with cheques which were disappointingly small. It was one afternoon when he was adding up those insignificant amounts that he glanced disgustedly at Brooks, who was, as usual, occupied with a large cigar. The placidity of the older man sometimes irritated him when times were trying—and they were trying now.

'Are you aware that we haven't sold enough stock yet to repay what we personally put into that property?'

Brooks nodded. 'It's a big country. Give the folks time.'

'Do you remember that we took in thirty thousand on the Big Master proposition in three weeks?'

'Money was easy then—it's tight now.' The older man wheeled in his chair. 'Don't you suppose I've been in the game long enough to know something about it?'

Sitwell played with his pencil. 'You're not looking just like your old self, Brooks,' he said presently. 'Not sick, are you?'

'Sick—no! I get short of breath—and I suppose I'm smoking too much; but, then, I always did.'

The other man pondered a moment. He knew that those with big, strong frames like Brooks often abused their strength, and then dropped out quietly but suddenly. He needed Brooks just now more than he had ever needed him, because he took matters evenly, and was not, seemingly, depressed even when they were at their worst, but remained a sort of speculative sheet-anchor embedded in some tenacious mud.

'I was thinking of Claudia,' Brooks went on quietly. 'How do things stand between you?'

'Well—I think. Sometimes it's hard to tell.'

'Has she forgotten that fellow Shanklin?'

'She never mentions him. I don't worry about it, anyway.'

'Never seen him?'

'No.'

'By God, Sit, I wish my wife were alive!'

Sitwell left his desk and put his hand on the big shoulder. This was the first time in five years that Brooks had referred to his wife.

'What's the matter?'

'I don't know. Seems to me as if there were about ten million people sitting in judgment on you and me and the Enterprise, and that the verdict will be along presently—not a favourable one. And I wish my girl was safely married.' His face took on the dull flush it sometimes showed; then after a moment he got up and shook himself like a dog.

'Forget it. I guess that cigar was too strong. Just the same, if Claudia is willing—why——' He broke off with a grin.

Sitwell smiled. 'If she is, I'm more than willing. I'll ask her to-night.'

II.

Brooks nodded and went out. He wanted to be alone for a while. He was curiously but quite definitely conscious that there was one thing in the world at the present time that really counted—his girl Claudia. He seemed to yearn towards her the more because, in an odd way, she did not fit into the scheme of his life. There were a good many matters which he did not desire she should know, and he wondered, with a touch of helplessness, whether in days to come Sitwell would screen her and set her apart as he himself had done. His mind turned to the Enterprise business, in respect to which Sitwell's anxiety rather amused him. They were playing a game—and there was only one way to play it. That was apart from whether the game was worth the candle or not. This one, he resolved, was the last he would ever play. And just then he felt that queer tightening in his chest and dryness in his mouth—and smiled grimly. Finally he went home and found Claudia.

She made him comfortable, and hovered over him like a protecting mother-bird. Presently she looked hard into his eyes, and settled down on a rug at his knee. His big hand wandered to the thick, brown hair coiled in slow waves, and rested there caressingly.

'Talk to me, Claudia.'

'Are you sure you don't want to talk to me?' She smiled up to him.

'Perhaps I do. We haven't seen much of each other lately.'

'What's in your mind, father?'

'You principally. I've been thinking a lot.'

'It would be easier for both of us if mother were alive,' she said with swift intuition.

He nodded. 'How are things between you and Herbert?' She did not answer at once, and he went on thoughtfully: 'If your mind is clear—why wait?'

'Do you want me to marry him?' Her face was turned so that he could not see it.

'It isn't what I want, Claudia.'

'But don't you feel that—well—that you'd like to see it settled?' she asked suddenly.

He pinched her ear. 'How did you guess?'

'It's written on your face whenever you look at me. Have I been such a handful?'

'I want to see you happy.'

'That's just it—should I be happy—quite happy?' She leaned forward, clasping her hands about her knees. 'You see, I haven't forgotten Jack. He's not easy to forget. Bertie's very different. He makes me feel like an ornament, and with Jack I felt like a companion. But I couldn't forgive Jack for what he did, however much I might have cared.'

Her father nodded again. The girl was so transparently honest that he shrank from any attempt at influencing her. He wondered how her mother would have put it if she had known what he knew. Then he remembered that while his wife was alive he had never been reduced to his present straits and stratagems.

'Is business worrying you, dad?' put in the girl, with that sudden interpretation of his thoughts she so often achieved.

'Not more than usual. I'm getting a bit tired of business. I'd like to get away and loaf for a while.'

'Is the new company not going well?'

'As well as most things do at the beginning,' he countered.

She drifted off into a thoughtful silence, having seized on the idea that were she safely married her father would be relieved from a most natural anxiety. Her thoughts went back to the time when she and Sitwell were nearly engaged. She recalled his attentions, his gifts, the thousand-and-one ways he took of reminding her of himself. Then Shanklin had come along, and, in spite of doing hardly any of these things, had captured her heart. The difference seemed to be that Sitwell offered gifts, and Shanklin offered just himself. He had told her quite frankly that life would for a while be a tussle for them both, and it had attracted her more than when Sitwell outlined a picturesque and luxurious future. Now that the tables were turned, all this came freshly to her memory. She glanced at her father, and meeting his eyes, discerned in them the shadow of care. His face, too, seemed drawn and weary. At that she had a flood of feeling. 'Would it make you more contented, dad, if Bertie and I were married soon?'

'Yes,' he said slowly—'if I knew that you weren't doing it just to please me.'

'Do you think I'd marry one man to please another,' she laughed—'or throw one over, either?' she added soberly. 'No—I think we should be very happy. Bertie is a highly finished product—much more so than I am. I'm sure we'd see lots of interesting things and people, but he mustn't insist on my being a potted plant, sheltered from every wind that blows—you understand. If there are going to be hard knocks, I want to take my share of them.'

The big man stroked her cheek tenderly. Hard knocks! That was inevitable. He could only trust to Sitwell's astuteness in years to come. He felt a touch of profound melancholy, perceiving that here and now there was being settled for his daughter the whole complexion of her life. He blamed himself bitterly for not having sent her while still a child to his wife's relations, who had begged for her; well-established folk who were immune from his own doubts and anxieties. Then, regarding her face, he felt comforted at its expression of courage and resourcefulness. No; a girl like this would make her own life, and never be overcome by hard knocks.

'By-and-by,' he began slowly, 'you must try to steer Bertie out of this promotion business. It's too—too uncertain. When this new company is on its feet would be a good time—you'll know when the opportunity comes; so don't hesitate. Don't let him hang on with the expectation of making a little more. Then persuade him to buy a ranch or go into business. It isn't so exciting, but it's healthier—a lot healthier. There's something in the smell of the earth that's good.'

The girl looked at him strangely, but did not speak. His eyes half-closed, and he rambled on, sometimes to her, sometimes apparently to an invisible person who stood near by. There were little hints of effort, tension, stress, disappointment, and success, as though he were unrolling his life and scrutinising it critically. Through it all she read a certain dissatisfaction, as if he had worked hard and got but little for it. It sounded like the musings of a man, old, tired, and disillusioned.

Her mind turned to Sitwell and her own future. What her father desired was quite clear. She wished that her own circle of acquaintances was wider, but it seemed that in spite of years in Los Angeles their circle was still small, and comprised but few of the people she really wanted to know. Perhaps marriage would find the way out. In the meantime she was alarmed at her father's manner and appearance, and impulsively decided that it was imperative his wishes be carried out. She made her decision with the superb confidence of youth.

They talked for some time longer, and Claudia felt nearer him than perhaps ever before. When Sitwell came in after dinner, he found her in a mood that was infinitely attractive. She seemed to have lost a touch of antagonism which had maintained a certain distance between them, and he felt for the first time that she really cared.

(*Continued on page 53.*)

SOME LOBBY REMINISCENCES.

PART II.

V.

OF domestic ceremonies in the lobbies there were comparatively few during the years that I was there. They but rarely happen. One, I recall, was the presentation from all parties to the Speaker and Mrs Lowther on the occasion of their silver wedding. The proceedings were quite informal, and full of personal charm. Mr Balfour, Mr Asquith, and Mr John Redmond, each in turn, combined to do verbal honour to the occupant of the Chair and his wife, and the ceremony was notable, and at the same time in all probability unique. Another historic event was the unveiling of the statue of the late Sir William Harcourt, on the first of the eight vacant pedestals to be so adorned—pedestals which the Fine Arts Commission no doubt anticipated would have been filled half-a-century before. An interesting spectator, in addition to Lady Harcourt, was Mr J. Pierpoint Morgan, the American millionaire. Before very long, it is hoped, another ceremony on much the same lines will take place in the same apartment, the House of Commons having recently sanctioned a grant for the erection of a statue of Mr Joseph Chamberlain, another great parliamentary figure, in close contiguity to that of the Squire of Malwood. The commission has been entrusted to a well-known sculptor—Mr John Tweed, of Chelsea—who, in addition to executing the work of Mr Cecil Rhodes, was responsible for the bust of Mr Chamberlain in Westminster Abbey, the Lord Clive statue in Whitehall, and, among much other work, the equestrian statue of Field-Marshal Sir George White, the heroic defender of Ladysmith, designed to stand in Whitehall Place.

The suffragette agitation is of far too recent origin to require much mention in this article, but in the preliminary skirmishes with the authorities the outer lobby was an important battle-ground and a rallying-place for all the more militant of these misguided women. At various times, by means of sundry ruses, some of the bolder spirits managed to elude the police and gain admission to the outer lobby, where their first really serious tussle with the powers that be occurred. On the night in question they came in furtively, and one by one, for fear of being recognised *en masse*, asked for various members, and waited. In a moment, at a given signal, they all jumped on to the cushioned seats which surround the apartment, unfolded their banners, yelled forth their war-cry, and commenced to harangue the idle and the curious. After a fierce and embittered struggle with the police, they were all captured and carried away like so many chickens, leaving the floor sadly littered with a medley assortment of crushed hats and twisted hairpins and other feminine accoutrements. A memorial of their antics is, by a curious coincidence, to be found in this very hall. In some of the mullioned windows the authorities subsequently placed the various sections of the grille in front of the Ladies' Gallery, when it was finally decided to remove this hated structure altogether. These included the actual window to which one of their more daring recruits padlocked herself one evening during the sitting of the House, so effectively that the window, with the chain still round her body and the key down her neck, had first to be removed before a ludicrous procession, consisting of the chief of police, the Serjeant-at-Arms, the culprit, and a policeman carrying the still attached portion of the grille, wended its way along the corridors to receive the attentions of the resident blacksmith!

It was through the lobby also that one of the wildest of the suffragettes, whose name should have been a sufficient indication of possible danger ahead, was escorted by a respected member who certainly ought to have known better. Left alone for a moment at the peep-hole at the entrance to the Chamber, she seized her opportunity, and taking a deep breath, and her courage in both hands, dashed up to the table of the House before she could be collared by the attendants. Thus was Parliament again scandalised at the very time when women were asking to be entrusted with the vote! On another occasion an upper gallery in the members' lobby was to have been the objective of one of the most courageous of all the suffragettes, had everything gone well. On Saturday, when the public are taken over the Palace, she joined the harmless procession, and, with a good knowledge of the place, managed at the proper time to dart aside and secrete herself in a ventilating-shaft, where she was to have remained until the following Monday afternoon. Then the Speaker's procession would have passed through the lobby on its way to the Chamber, and she would have demonstrated from the gallery, which she was to have reached from her very uncomfortable position. Unfortunately her plans were spoilt by the turning on of a heat-flue, which rendered her position untenable, and thus in a half-baked condition she had to quit and own up!

VI.

Of the many outstanding figures whom I recall in the lobbies, perhaps the most interesting of all was Sir Henry Stanley, the famous explorer, with whom I had many talks both in

Parliament and at his private residence across the way. He was quite out of place, and appeared to be very uncomfortable in Parliament, and indeed, so far as I can remember, never made but one speech, and that not altogether a success, on the work of the Uganda Railway, over which he was ever so greatly enthusiastic. I heard him at one of his election meetings, at the Canterbury Music-Hall, on the other side of Westminster Bridge, when Mr Chamberlain occupied the chair. Sir Henry's hair, as the result of his prolonged travels in Darkest Africa, was silvery-white, and during the meeting a voice from the audience sang out rather testily, 'We don't want old men in Parliament.' Mr Chamberlain, spruce and debonair as usual, sat by the side of the candidate, and the contrast was too much for the critical elector. But Mr Chamberlain, in his most cynical manner, was ready with a rejoinder, as he always was. 'Perhaps,' he slowly remarked, pointing his finger at the interrupter, which had the effect of making all heads turn in that direction—'perhaps,' he said, 'the honourable gentleman who interrupts my distinguished future colleague is unaware of the fact, and indeed may be interested to learn, that I was already at school before the elderly gentleman on my left had even been born!' After this there were no further quibbles on the score of *anno Domini!*

Another—and this a really venerable figure—was old Mr Spencer Charrington, the millionaire and octogenarian brewer. His family was by no means altogether 'entire,' for his son, Mr F. N. Charrington, the well-known temperance enthusiast in the East End of London, was also responsible for a demonstration in the Chamber a few years ago which again scandalised the mother of Parliaments. It was on 18th May 1915 that he rushed up the floor, and, amid a scene of considerable excitement, moved the mace as a protest on the temperance question. Mr Spencer Charrington, sen., was once the recipient of a remarkable gift, the presentation of which was made the occasion of a demonstration in force. Although considerably over eighty, he remained throughout an all-night sitting of the House, recording his vote at intervals, and exhibiting no traces of fatigue. Here was a splendid object-lesson to the younger bloods of the Unionist Party who may have been up all night, but certainly not in the House! A few days later Mr Balfour, in the presence of a crowded gathering of his followers, handed to the veteran parliamentarian a handsome piece of silver in recognition of the pluck which he had displayed in his efforts to support the Government. Further comment is needless!

Another very curious personality I well remember was the late Mr Jasper More. He was lord of I don't know how many manors, sheriff of his county, deputy-lieutenant, and all the rest of it, and yet he dressed so deplorably, even shabbily and raggedly, that it was difficult to associate him with the high offices which he held from time to time. He showed me on one occasion the following amusing quatrain, with which he was greatly pleased, and which I believe he intended should be placed on his tombstone:

Hic jacet plus,
Plus jacet hic,
Plus et non plus,
Quomodo sit?

Here lies More,
More lies here,
More and no More,
How can that be?

Then there was dear old Sir Robert Mowbray, who succeeded Mr Charles Pelham Villiers as father of the Commons, and whose bust adorns the committee-room in which so much of his work as chairman of the Committee of Selection was done, extending over a very long period of years. I recall also Sir Charles Hamond, a venerable representative of Newcastle-on-Tyne; Sir Benjamin Stone, whose photographs in the parliamentary corridors will remind future generations of members of his skill in, and devotion to, the art; Sir Charles Palmer, of Jarrow; Sir Charles Dilke, Mr Tom Ellis, the Chief Liberal Whip in Lord Rosebery's Government, and Mr R. K. Causton—now Lord Southwark—the three fastest walkers who ever scampered through the lobbies; Mr C. J. Darling—'Deptford's Little Darling,' as he was affectionately termed, now 'Darling J.'; Sir G. Osborne Morgan, styled the G.O.M. of Wales, who was very nearly called over the coals for inviting a Welsh choir to sing national selections on the Terrace; Mr Cumming Macdona, alternately parson and president of the Kennel Club, who achieved the distinction, a mystery to himself to the day of his death, of having voted in both lobbies in the same division; and Sir A. F. Godson, who greatly amused Downing Street on a certain occasion. Sir Augustus was the recipient of a belated knighthood. Before leaving London for the recess he gave strict injunctions that no circulars were to be forwarded to him. Along came a letter without a stamp, and was promptly consigned to the waste-paper basket. The too zealous butler had failed to notice in the bottom corner the magic word 'Salisbury,' and thus it was that Sir Augustus's name never figured in the original list of knighthoods, but appeared later in a special *communiqué* all by itself.

Then there was Sir John Aird, with his long patriarchal beard. When he returned from his great work on the Nile at Assouan, he was asked again and again by the lobby wits whether he had left the bed of the great river well *aired*! I remember he was the champion winner of the Derby and other sweepstakes at his West-End clubs as well as at the House. Finally, there were Mr Joseph Arch, M.P. for Sandringham,

and therefore the parliamentary representative of the past and present sovereigns, and champion hedger and ditcher of his native county; Sir Frank Lockwood, who contributed so much to the gaiety of the lobby, as he also did with his inimitable sketches on the committee-room blotting-paper; Admiral Field, who was rarely seen in the lobby without a small ladies' reticule which he almost invariably carried; Sir Donald Currie, who received the news of the disaster to the *Drummond Castle* whilst talking to his friends in the lobby; and Mr William Field, whose enormous sombrero hat and conspirator's get-up generally must have given the police many an unpleasant shock for the moment as he emerged from the dark cloisters on his way to and from the House. Mr Field had a curious habit of talking to himself in the lobbies, and many a time, after a division, I have heard him in the corridors ask himself, kindly but firmly, 'Now, William, do you think you should have voted for that amendment?'

VII.

Very queer visitors to the lobby in the middle 'nineties were the brothers Ansah—Albert and Ossoo—who came to this country as the self-styled ambassadors of the bloodthirsty King Prempeh of Coomassie in defiance of the Governor of the Gold Coast, who had declined to receive them or to recommend their case to the Colonial Secretary at home. They lived in great style in Kensington, where I often met them. There they were joined by a certain so-called 'Prince' Brew of Dunquali, who lived in this country. Their grievances were taken up by the late Mr H. C. Richards, M.P., the well-known parliamentary Churchman, and one evening he brought them, all attired in faultless evening-dress, through the lobbies. They were accompanied by an attendant carrying a silver flask on a chain, containing the water with which, in accordance with custom, they moistened their lips at sundown. In the end they left this country rather precipitately, as the Government had decided to send a military expedition to Coomassie. The rest of the story is soon told. After the dethronement of the king in his capital the Ansahs were summarily arrested and handcuffed, much to their chagrin and surprise, on a charge of forging the king's credentials. What has since become of them I know not. The king was deported to the Seychelles, where he subsequently became a devout Christian. Incidentally, he was there ruled over by Sir Eustace Fiennes, once a popular M.P. for Banbury, a member of one of the oldest families in the country—Saye and Sele—and a former private secretary to Mr Winston Churchill at the Admiralty.

Of all the curious visitors seen from time to time, however, in the lobbies, the most interesting I ever met were the pigmies who were brought to this country just twenty years ago by a Colonel Harrison, and with more or less success—less, I think, rather than more—made a tour of this country. It was my good fortune to hear of their projected visit to the lobby, and I promptly got into communication with Sir Benjamin Stone, M.P., who took on the Terrace the only picture of the kind extant. It was singularly appropriate that the group should include, in addition to the little people, who carried their primitive bows and arrows, Sir John Batty Tuke, M.P., the well-known brain specialist, and Sir Charles Hutchinson, M.P., another prominent member of the medical faculty and a former M.P. for Rye. It was this same Sir Charles who, when delivering his maiden speech in the House of Commons—fresh from the hustings—persistently addressed the Chamber as 'gentlemen.' When eventually called to order by the Chair, he rejoined, amidst shrieks of laughter, 'Well, I'm blowed, Mr Speaker; this is the first assembly I've ever addressed in which I have been forbidden to call my colleagues "gentlemen."' And the rest of the hon. member's parliamentary career was plane sailing!

THE END.

THE BOOK OF DEER.

By G. M. FRASER, Librarian, Aberdeen Public Library.

NEARLY all English-speaking persons who are interested in the literary treasures of the nation have heard of the Book of Deer. To most people it is merely a name, but it is so remarkable in one respect—unique, in fact—that a better knowledge of it will be helpful. It lies in the great library of Cambridge University, an item of special interest to Celtic scholars all over the world.

The story of the discovery of the Book of Deer is in itself a romance of bibliography. It happened in the autumn of 1857—not in 1860, as nearly all the books on the subject say. Henry Bradshaw, afterwards Librarian of Cambridge University, but then (a Fellow of King's) employed in overhauling the ancient manuscripts in the library at a fee of twenty pounds a year, had his attention drawn to a small, odd-looking volume, partly written in Latin, and partly in some language resembling ancient Irish. Bradshaw—who was consumed with all manner of scholarly interests—was then engaged in collecting books on Irish history; hence his interest in the Irish-looking portions of this small book.

He found that it was a book of the gospels written in Latin, in Anglo-Saxon handwriting of about the ninth century. It was a very corrupt and incomplete version of the Vulgate, not uncommon in that period. A curious feature of the work was that it contained coloured pictures and designs of the same style of work as the writing, evidently by the same hand. These included illuminated portraits of the evangelists —very absurd and lifeless portraits they are— with other figures and whimsical ornaments.

But the most singular thing about the volume was that certain blank pages, and margins, had been filled in by a scribe of later date in the Gaelic then spoken in Ireland (and still spoken there), in the Highlands of Scotland, and parts of the Isle of Man. It seemed certain, from the character of the volume, and the date and character of the later entries, which consisted largely of grants of property and exemption from taxes, that the book had been venerated somewhere as a sacred relic many years after it had been written, and used as a depository of documents, and probably also as a book on which persons swore in claiming their lands.

The interest of scholars was keenly aroused. Among them was the late Whitley Stokes, the famous Celtic scholar, who drew public attention to the discovery in an anonymous article that he wrote in the *Saturday Review* in 1860.

By that time the true character of the volume had become clear. It turned out to be the book of the Columban Abbey of Deer, in Buchan, an insular region in far-off Aberdeenshire. The abbey had been in ruins, practically forgotten, for centuries before the recovery of this remarkable and really priceless relic revived interest in it, and in the Gaelic-speaking monks who carried it on.

So now it will be seen that the significance of the Book of Deer lies not in its Latin script and pictures of the ninth century, or thereabouts, but in its later Gaelic entries. These turned out to be notes in Old Scottish Gaelic, originally the same as Irish Gaelic. It has been put down as of date between 1000 A.D. and 1150, and that means—hence the chief value of the book—that it is the oldest specimen of Scottish Gaelic in existence. The next oldest is a charter of lands granted by Donald Macdonald of the Isles in 1408; but as Macdonald—who was the noted leader of the Highland host in the battle of Harlaw, 1411—was an Oxford man, educated in English ways, his charter is a feudal document, although, of course, its language, like that of the Book of Deer, is also of special interest as showing its character in the period.

But the Book of Deer is pre-feudal, and its grants of land to the abbey show the manner of benefactions in use before the country was divided into parishes. Hence its value for general history, as well as for its ancient Gaelic language.

A most curious feature of the Anglo-Saxon script—the Latin version of the gospels—is that the words do not stand *on* the line, as writing does usually. A sharp instrument of some kind had been used to make straight lines across the page, and the words are all *hung from* the line, showing beautiful evenness along the top of the writing, but irregularity along the bottom. This was not done in the case of the Gaelic entries, although in one instance, where the Latin scribe had ruled the whole page before beginning to write, then left half the page unfilled, the Gaelic scribe completed the page two or three hundred years later, but did not stick to his predecessor's ruling.

The story of the wanderings of the volume will never be known now. It had lain unnoticed in the library of Cambridge University for over a century, among the books that belonged to John Moore, Bishop of Ely, bought by George I. in 1715 for £6000, and presented to the university. Where it had lain for the four or five hundred years prior to 1715 we cannot tell, but that it was the chartulary, in a sense, of the Abbey of Deer is testified by these Gaelic entries in a manner that admits of no doubt.

With regard to the Gaelic notes—which, as already said, constitute the chief value of the Book of Deer—only a general idea can be given. Every particle of the writing is of value for various reasons, but the linguistic aspect, the most intensely interesting aspect, must be considered in detail to be appreciated.

The earlier Gaelic notes purport to be a history of the founding of the Abbey of Deer by St Columba and St Drostan, his nephew and pupil, who came from Iona, and being struck with that part of the lands of Buchan, set up there the Abbey of Deer. The scribe may have been setting down the current tradition of the founding of the abbey. He was certainly not setting down authenticated history, for he was writing about five hundred years after the events could have happened.

The scribe ventured into another region which is still sometimes opened up by persons not very well equipped for the work—the region of the origin of our place-names. This eleventh or twelfth century writer, speaking of the parting of St Columba and St Drostan at the spot, says that Drostan's tears (*déara*) came. Then said St Columba, 'Be Dear its name from henceforth.' This is very popular etymology. 'Deer' is well understood now, as the late Dr Macbain pointed out, to be the same in origin as Derry (Londonderry)—that is, 'doire,' an oak grove. It was a very common name in Ireland—Derrybeg, little oak wood; Derrymore, great oak wood; Derryduff, black oak wood; and so on. That this is the real derivation of the name 'Deer' is made more likely by the fact that Derry and Durrow (the 'plain of oaks') were the two leading Columban

monasteries, and Churchmen in early days were fond of naming their little local oratory or church after famous ecclesiastical centres.

So much for the uncertainties of the Book of Deer. The entries as to grants of land and other offerings to the abbey, and exemptions from certain imposts, are authentic contemporary history, and are extremely valuable. If we had nothing but the Book of Deer to guide us, we should not be without some sound knowledge of the race and the language of the people of Scotland, of their Church polity, and their manner of transferring and holding property, prior to the introduction of the feudal system, and prior to the spread of the English speech and customs, the growth of burghs, and the rise of commerce over the Lowland parts of the country.

It is pretty clear that the Gaelic of the Book of Deer does not all belong to one period. While some of it may have been written soon after 1000 A.D., the rest may be a century (more or less) later. But it is all most valuable for the time.

A few words must be said on the bibliography of this remarkable book, so that persons who may be specially interested may study the matter further for themselves.

The very first, I think, to print anything about it was the late Cosmo Innes, one of the accomplished legal historians of Scotland. He published his book, *Scotland in the Middle Ages*, in 1860, and was just in time to add what he termed a 'Postscript' to that work telling something of the discovery and character of the Book of Deer.

As already mentioned, Whitley Stokes explained about the discovery in the *Saturday Review*, 8th December 1860. But he also published an edition of the Gaelic, with English translation, in his *Goidelica*, 1862.

The Book of Deer was admirably published, in complete form, with facsimile coloured plates, by the Spalding Club of Aberdeen—*The Book of Deer*, edited by the secretary, Dr John Stuart, 1869. The English translation of the Gaelic is by Whitley Stokes, and the Spalding Club edition is practically all that could be wished, short of the Book of Deer itself.

The most scholarly study of the Gaelic in the Book of Deer is a paper by the late Dr Alexander Macbain, Inverness, namely, 'The Book of Deer,' in the *Transactions of the Gaelic Society of Inverness*, vol. xi., 1885, afterwards printed off as a pamphlet. Dr Macbain, although he was misled by a reference in the Spalding Club edition as to the date of the discovery, made an extraordinarily careful and scholarly study of the work. He gave an English translation of the Old Gaelic, and discussed—as the future author of the only Gaelic etymological dictionary was fully competent to do—every word contained in the Gaelic portions of the volume.

Very nice facsimile plates, with explanations, are also to be found in vol. ii. of the three fine volumes of the *National Manuscripts of Scotland*, published officially, 1867–71, and to be seen in the principal public libraries of the country.

A popular discussion of the Book of Deer forms one of the chapters in Magnus MacLean's *Literature of the Celts*, 1902, but Dr MacLean, like Dr Macbain himself, was misled as to the actual date of the discovery of the volume.

For definite and clear notes on various aspects of the Book of Deer one must consult the volume published by the late Sir Archibald Lawrie in 1905, *Early Scottish Charters before 1150;* and for a comparison of the Ancient Gaelic speech of the Book of Deer with modern Gaelic the reader could not do better than look at *Rosg Gaidhlig* ('Gaelic Prose'), an anthology of Gaelic prose literature, published by Dr Watson, Professor of Celtic Languages, &c., Edinburgh University.

Other and minor references to the book may be safely neglected, for the foregoing tell all that is necessary—or, indeed, can be known—about this singular book. It is a remarkable bibliography for a small volume that was neglected for so many centuries, but the book itself is one of the bibliographical wonders of our time.

It is a comfort to know that in the library of Cambridge University this priceless little volume is esteemed, and most carefully guarded. In a sense, it ought to be in one of our great public libraries of Scotland—or in the British Museum, among other national documents; but short of these, it could not be in better hands than where it is. A few months ago the courtly librarian of Cambridge University, in handing me the volume from its glass case for inspection, mentioned that a few days previously he had received a letter from a person in India with regard to the book. It was a significant incident, suggesting that, in due time, when its real value becomes better known, the relic will become an object of enlightened interest to all concerned in the history and the speech of the country.

NIGHT IN AFRICA.

With gold and blood-red strokes the artist's hand
Completes the canvas of the brilliant day,
And, having swiftly taken it away,
Begins anew. Behold, instead, the grand,
The glorious night across the brooding land,
Upon infinite fields the starry flocks astray
(The Southern Cross amid their fine array),
And velvet shadows where the mountains stand!
The gleaming kraal-fires pierce the plains' dark wall,
And distant drums throb through the quiv'ring air;
Cicalas shrill their song; the forest lair
Is tense with hidden life; and over all
The moon's dispassionate white glories fall—
A picture nobly wrought, and nobly fair!

HOW TO KNOW THE PLANETS.

By Professor GEORGE FORBES, M.A., F.R.S.

I.

EVERY one who has seen Turner's picture of the Dogana, Venice, or even the fine engraving of it, must have felt that it owes not a little of its charm to the bright evening star shining in the glow of sunset. Many an artist besides Turner has known how to catch, on a still evening, the soft beauty of Venus beneath the thin crescent of the young moon, as a part of his sunset-picture, say of the warships in Portsmouth harbour. Or, at that hour, he has been able to add something to the pink anti-glow of sunset in the east, by choosing an evening when Jupiter and the full-moon are reflecting their beams on the harbour's ripples.

Jupiter, Venus, and the other planets (that is, wanderers) differ from the rest of the stars in two respects. They are not fixed, but move about from one constellation of stars to another. And, again, each of them varies in brightness from month to month, and it is only now and then that any one of them actually compels our attention, unless we are very careful watchers of the stars.

It may surprise some of the less careful watchers to know that there are only five of these planets ever visible to the naked eye. All of them are occasionally very bright. They are Mercury, Venus, Mars, Jupiter, and Saturn. And for practical purposes Mercury may be left out of account, because he is small and, being never more than twenty-three degrees away from the sun, he is seldom seen in our climate.

The four principal planets, brilliant lamps of the sky, are admired by all, and often we hear the query, 'What is that lovely star we see every evening now in the west?' The answer is very sure to be, 'The planet Venus,' a round planet that shows in a telescope all the phases of the moon, but in a year and a half instead of one month.

Sometimes the query may take this form: 'Before going to bed, lately, we have been noticing a wonderful great star in the south. What star is it?' The answer will be, 'It must be a planet—either Mars, Jupiter, or Saturn.' An astronomer might, of course, know which of them is in that direction at that time. But a moment's inspection would suffice to make this known to any one who cares enough about the stars to notice things for himself.

It is certainly a pleasure to know some of the fixed stars* by name; but they are always in the same place among the others, and of the same brightness, except in hazy weather. It is a much greater pleasure to find a planet in its wanderings, and to be able to welcome Mars or Jupiter by name after many months of absence.

Everybody knows about the solar system—that you can make a rough representation of it on a flat plane table by putting a ball in the middle of the table for the sun, and drawing circles on the table for the orbits of the planets. These would be represented by little balls moving on the circles all in one direction (anti-clockwise, if we suppose ourselves to be looking at the table from the northern hemisphere). And the planets in the smaller circles move quicker than those in the larger circles. Of course, it is also well known that the orbits of different planets are not exactly circles, but ovals, and they are very slightly tilted to the table, on whose surface our earth is supposed to move. But the tilt is found to be very small, and need not be considered at first.

Now it is all very well to say that everybody knows this because he has read it in a book, but it is far better if we can find it out for ourselves. Then we shall be able to distinguish the planets from other stars and from each other, and that is what the books do not generally tell us.

II.

There are three ways of knowing a planet as such when we see it. The first two are very quick and easy to apply, but not so certain as the third. The first clue is this: Whenever you see an unusually bright star, unless it be Sirius, it is probably a planet in that part of its orbit where it becomes brightest to the inhabitants of our planet, the Earth. Take Venus, for instance, on a circle that is always inside the earth's orbit. She does not shine by her own light. The half of her next the sun is lighted by the sun; the rest of her is dark to us. So, when Venus is nearest to us, we are looking at her dark side,

* See 'How to Know the Stars,' by Professor Forbes (*Chambers's Journal*, November 19, 1921).

 [*All Rights Reserved.*]

which is invisible. When she moves a little away from there we see a little of the illuminated half like a crescent moon. Venus is never at a greater distance from the sun than about forty-five degrees. When at that place she looks in the telescope like a half-moon. She is then nearly at her brightest. For when she goes farther round, turning to us the whole of the illuminated hemisphere, she is so far away that the light is much feebler.

During the period that Venus is about forty-five degrees from the sun she is brighter than any other star or planet, and can easily be seen before sunset. In fact, she can then be sometimes seen at midday, if you know where to look; and she casts a shadow on the deck of a steamer.

None of the other three planets is brightest when near the sun. So, if we see an extremely bright star in the west at sunset, or in the east at sunrise, we are very safe in asserting that it is Venus. The crescent moon also is never far from the sun. This is the reason why a very brilliant star near a delicate crescent moon is probably Venus. But the full-moon is always at the opposite part of the sky to the sun. And for that reason a brilliant star near the full-moon cannot be Venus.

As to the other planets (Mars, Jupiter, Saturn) outside the earth's orbit, they are brightest when nearest to us—that is, when sun, earth, and planet are nearly in line, and we see the whole hemisphere that is illuminated by the sun. The moon also, when at the full, is nearly in the same line as the planet, away from the sun. That is the reason why a very bright star near the full-moon is probably Mars, Jupiter, or Saturn.

It is generally possible to judge, by mere inspection, which of the three planets we are looking at. Mars is always red, and becomes fiery-red when he is nearest to the earth. Jupiter is much the largest of all the planets, and is invariably a very bright star; but he has not the red colour of Mars, which colour is, doubtless, due to the sandy soil of Mars. The more distant planet, Saturn, is duller and yellowish.

With a pair of opera-glasses Jupiter can always be positively recognised, because he has four moons large enough to be almost visible to the naked eye, besides four very small ones. Some of the four Galilean moons (discovered by Galileo)—possibly all four—may be seen with a small glass, and, as they are close to Jupiter and all lie on a line going through the planet, they cannot be mistaken, though constantly changing position. If, then, the glass shows three or four small specks of light, on a line going through the planet, we may be sure we are looking at Jupiter. These moons changing their positions on the line are a constant delight.

If you direct upon the planet Saturn a telescope larger than the little one that shows Jupiter's moons, you know at a glance which planet it is. For it is not round, but elongated, owing to the marvellous flat ring that surrounds its equator, generally tilted at an angle.

III.

The second clue for identifying a planet among the stars is most useful when the planet is not at its brightest—not brighter than some of the fixed stars. *The fixed stars generally twinkle, the planets almost never.* Every one has noticed on a clear night the rapid flashing of stars, called twinkling or scintillation. It is caused by small particles in the atmosphere which deflect from the eye a ray of light that ought to reach it. The effect is momentary, because the particles are in motion, and quite small. It is constantly repeated, because there are many particles. Some stars twinkle more than others.

Every one knows that our atmosphere bends a ray of light from a star downwards, and that the light of a star contains rays of different colours that are bent to different degrees by the atmosphere. Thus the rays of different colours do not follow exactly the same paths from a star to our eye. It follows that the atmospheric particles causing scintillation, in their motion, deflect the different colours not all at once, but in succession. This is easily seen in a spectroscope attached to a telescope. But a very pretty experiment may be made without any special apparatus, showing the effect in a beautiful manner.

If a small telescope or an opera-glass be pointed to a star, and if we keep on tapping the instrument, then the star seems to move about. Its image persists on the retina for a fraction of a second. So the moving star-image looks like a string of light that can be twisted into a coil of different shapes by judicious tapping.

Now, if the star be a good twinkler, the string of light seems to have gaps in it, showing when a particle is deflecting the ray of light out of our line of vision. But this is not all. The particle deflects different colours in succession. Sometimes green, sometimes red, is deflected from the eye. The result is that the string or coil of light is converted into a beautiful pearl necklace interrupted, not by mere dark gaps, but by the brilliant scintillations from diamonds, rubies, sapphires, and emeralds. Try this experiment, and show it to your friends.

These remarks on twinkling help to explain why fixed stars twinkle and planets do not. A star is at such an enormous distance that, in spite of its great size, it looks like a mere point of light. But a planet is near enough to show a disc of sensible size in a telescope. A particle in the atmosphere may deflect from our line of sight a ray of light coming from a point, and yet be too small to affect all the rays coming from different parts of the planet's surface.

This is the reason why you may be sure that a star which twinkles is not a planet.

IV.

The two clues already given for distinguishing planets from other stars are not absolute. The third clue is the only sure and certain test. It depends upon the position of the doubtful object among the other stars.

After we have got to know some of the constellations, and noted the places occupied by planets, we make this great discovery: that planets do not turn up in all parts of the heavens. In the greater number of the constellations planets are never seen. There is, in fact, only one straight road or track among the stars, and not a very broad one, in which we ever see a planet, or the moon or the sun. At first it seems almost absurd to speak of the sun following a track among the stars, as we don't see the stars in day-time. But this happens only because the sun's light illuminates the atmosphere, and makes it brighter than the stars. It is a surprising truth that the stars are shining just as brightly by day as by night. The sun and the moon, being both wanderers among the stars, were in old days included among the planets.

How can we find the path among the stars followed by the sun, the moon, and the planets? Sometimes we have the good fortune to see three planets at the same time. In that case we can see for ourselves that the path is a straight line right round the earth. It is not easy to imagine correctly a straight line among the stars. The best plan is to hold up a walking-stick, and we find that it covers all three planets at the same time, provided no two are very close together. This is true all the year round, so the track is continuous right round the earth. Thus we learn from our own observation that the planetary orbits lie all nearly in one plane, like the flat table spoken of above.

While holding the stick in line with any two planets it is easy to note those stars and constellations that are covered by the stick, and to continue the line among the stars that forms the apparent path of the sun, the moon, and the planets. This path is called the ecliptic—a word strictly used for the path of the sun among the stars, but applicable also as a rough guide to the paths of the planets and the moon.

In this way we might be fortunate enough to see the moon half-way between Aldebaran and the Pleiades, while Mars might be in the Twins, below the bright stars Castor and Pollux. If Saturn happened at the same time to be near the bright star Regulus in the Lion, and Jupiter at Spica in the Virgin, we should be able very easily to trace out with our stick the whole of the northern half of the ecliptic, which, to us in these latitudes, is its most interesting part.

With the help of a star-atlas, or some 'Easy Guide' containing pictures of the constellations, it is a very simple affair to get to know the constellations lying upon the ecliptic, the twelve signs of the zodiac, which divide the yearly path of the sun into twelve months. This occupation goes far towards completing our familiarity with any stars that happen to be shining, at any time of the year.

After this has been done no one can be in doubt about a planet. If a star we are looking at is not on the ecliptic it cannot be a planet, and, knowing all the bright stars on the ecliptic, we cannot mistake them for planets.

V.

Every astronomer can remember the time when he first reached this stage and acquired the habit of watching the movements of the planets along the ecliptic. It is a good plan to draw a picture of the stars among which Mars or Jupiter is moving, and to mark the planet's place from week to week. Saturn takes thirty years to complete the circuit. Jupiter passes into a new sign of the zodiac each year, taking twelve years to go right round. Mars takes about two years.

All the planets revolve in their orbits from west to east—that is to say, from *right to left*, as we look at them in the southern half of the sky. But, strange as it seems, our star-picture on which we mark, from week to week, the place of Mars, Jupiter, or Saturn at its brightest—that is to say, 'in opposition'—shows it to be apparently moving for some months in a retrograde path, from *left to right*. It was the understanding of this retrograde motion that led Copernicus to insist that our earth is a planet revolving round the sun between Venus and Mars. He recognised it as an optical illusion, such as we ourselves are accustomed to see when two railway trains or two ships are moving side by side and we are in one of them. The motion may be so smooth that we do not take account of it. The other ship seems to move in the true direction of motion only when it is going faster than we are. If our ship is the faster, the other seems to lag behind or to be moving with retrograde motion when we compare its place with the distant shore.

So it is with Mars, Jupiter, or Saturn. At a time of 'opposition' the earth and the planet are moving on parallel courses, and the earth moves quicker than any of them, so the planet seems to move backwards among the stars, until the earth in its circular orbit has changed its direction, and no longer gives us the optical illusion of retrograde motion. Of all the planets showing retrograde motion Mars is the most remarkable. It is so much nearer to us than Jupiter or Saturn that the extent to which it seems to double on its track and go backwards makes it appear to be the most flighty and erratic of them all.

These hints and clues that have been thrown out to help any one to know the planets have often led people to take a new interest in the firmament. Then with the help of books and a telescope they have rejoiced in a new hobby. Others, fortunately for us all, have gone further, and have therein found a new and permanent aim in life. It is thus that many an astronomer has made himself, and has trained his eye, hand, and intellect to work as the servants of the human race, by revealing to us the wonders of the heavens, and the immutability of the Creator's will in the enforcement of those laws which He has established for the working of a world and the evolution of a universe.

VI.

It is not possible in this article to describe the planetary phenomena that are disclosed by the telescope. These can be studied in special books, whose revelations may now be hinted at, by a brief glance at the telescopic wonders that exist on two of the planets.

Pointing a good telescope at Saturn, the most distant planet visible to the naked eye, we have a vision of so startling a character that no other sight known to astronomers could have suggested the possibility of such a structure. We on this earth are glad to have our single moon to guide our way on a dark night. Saturn rejoices in ten moons. But the really marvellous feature of Saturn, stranger than any other heavenly object, is the great bright flat ring surrounding its equator, tilted at an angle to us. Twice in each revolution of Saturn—that is, every fifteen years—when we see Saturn in the constellation Leo or Aquarius, this ring is edge-on to us; and it is so thin (only fifty miles thick) that at these times the ring is invisible in a telescope. It has been like that in the past year. That fifty miles, at the distance of Saturn, is like the thickness of a sheet of paper at three miles, and cannot be seen. Tilt it, and the reflected light from the paper or from Saturn's ring is brilliant. Large telescopes show this marvellous flat ring to be divided into concentric circular flat rings, separated by black empty space. The innermost ring is dark and semi-transparent.

If Saturn is a marvellous object as seen from the earth, our imagination is bankrupt in attempting to think of the midnight splendour as seen on that distant world. It has ten moons, mostly on the line of the ecliptic, many of them above the horizon at the same time, some full-moons, some at the quarter or crescent, and they differ greatly in size. Winter on that planet must be appalling, as it lasts for seven years instead of three months, and all that time the ring acts as a screen, shutting out the sun's rays by day from nearly half the planet. But who can truthfully describe the aspect of the great flat equatorial ring, illuminated on the one side by the sun during the nights of a Saturnian summer?

For during the summer of the northern hemisphere the great arch of light is shining as if with the light of a thousand moons upon land and sea, with an inner arch of clear sky and stars low down on the southern horizon. The bright surface is divided by thin black rings that separate the concentric bright rings. And at this season, at midnight, the sun casts a shadow of the planet on the ring, and a great upright arch of the ring is cut out from the sun's light, leaving it black. Thus at midnight the central southern parts of the ring are in darkness, though tinged at their edge by the colours refracted through the planet's atmosphere. This leaves only two horns of white light, with a rainbow-coloured sunset on their inner edge, rising from broad bases in the south-east and the south-west, both curving southwards and towering upwards, to meet in a thin bright connecting-line at the top. This wonderful pair of luminous horns of the ring rise in the east, and set in the west every night. The height to which the brilliant arch of light attains in the sky depends on the latitude. In the Arctic regions the ring is wholly invisible, and from places nearer to the equator the stars could be seen under the central arch, which there is nearly overhead. Certainly a telescopic examination of Saturn opens the gates of speculation and conjecture to an extent that ought to satisfy the most imaginative of poets.

VII.

To pass from the most distant of the three exterior planets to the nearest one, Mars is so much closer that it excels all other planets in distinctness of details. Its surface is marked by shades and tints, dark and bright, with definite boundaries and shapes that are permanent. These suggest the notion of continents surrounded by oceans. We see the planet rotating regularly in twenty-four hours as the earth does. We observe its axis of rotation to be inclined like the earth's axis, giving the seasons of summer and winter on Mars, as with us. The North and South Poles are each covered with a brilliant white cap, suggestive of snow and ice, like our Arctic and Antarctic regions. Moreover, astronomers have discovered by exact measurements that after the season has passed, in northern latitudes, from winter to summer, the size of the ice-cap at the North Pole has diminished, probably from the snow melting, while that at the South Pole has increased. Signs of vegetation growing at that season and darkening the soil have been suspected. Be this as it may, enough has been certainly observed to assure us that in many respects the two planets Mars and Tellus (our earth) have much in common.

When this has been accepted, not merely as

an authoritative statement, but from frequent examination with a telescope, we remain convinced that Mars is a world like ours, and that our world is a planet like Mars.

On reaching this conclusion speculation becomes inevitable, and we ask ourselves the great question, 'Do men and women inhabit Mars and the other planets?' Once started, speculation will carry us still further. We know that the stars are suns, like our sun. We know that some at least, and possibly all, have colder bodies, or planets, revolving round them; and we ask, 'Are there solar systems among the stars? And is each star the centre of a system of planets, as our sun is, and is each one of these planets inhabited by a race of human beings?'

Such questions are hard to deal with. There are astronomers who have watched the annual changes on the planet Mars for years and years, who assure us that they have detected signs of human contrivance and workmanship upon Mars, in the form of gigantic canals made for irrigation.

The ruddy hue of Mars which we perceive is due to its soil. Of that there is little doubt. This seems to imply that the continents upon Mars are mostly made of sand like our deserts. If this be so, the Martians may suffer from drought, and might well be expected to tap the source of water in the melting polar ice-caps, and lead it in huge irrigation-canals to water the deserts, and to cultivate their banks and near-by lands with crops and vegetables, in the manner of the Egyptians with their source of water-supply, the Nile.

Much has been written in favour of this view by responsible astronomers; but the disbelievers are many, both as to the accuracy of the observations and the fairness of the deductions. For the present we will leave it at that. It must, however, be remarked that on most of the planets, if not on all, the conditions of temperature are such that it is unlikely that human beings made as we are could exist.

People who delight in controversy as to whether there are human beings on the other worlds generally admit the truth that there is no scientific evidence on one side or the other. So they indulge in non-scientific speculations as to what they themselves consider the most probable, and this opinion depends often upon their notions about what the Creator's purpose was in the creation. In all this kind of discussion most astronomers patiently and in all humility await some real evidence. 'Canst thou by searching find out God? Canst thou find out the Almighty unto perfection?'

MAN'S WORK.

CHAPTER III.

I.

DURING the week which followed his dismissal from Burley's office, Shanklin made a complete analysis of himself and his affairs. The manner of his discharge had softened the blow, and he deposited two thousand dollars to his savings account with a grim satisfaction that the total was now seven thousand. He knew Burley too well to misunderstand the expression in the little lawyer's eyes when they parted, and he was glad of that. But now everything was pulled up by the roots, except his love for Claudia, a touch of sympathy with Claudia's father, and a cold hatred for Herbert Sitwell. It was Sitwell who had displaced him—a thing to be remembered. At the end of the week he packed his trunk, gave up his room, and went into the country to work matters out. It was typical of him that he took a job on a small ranch. He could think while he worked.

In the days that ensued the thing became fairly clear. There were two activities open—law and oil—and of the two, he believed that oil, searched for and developed legitimately, offered the greatest inducement. But to his present knowledge of the subject he must add a practical training, and, moreover, get his instruction at no pecuniary cost to himself. This decision made, he laid down his tools, drew his pay, and started on foot through lemon and orange groves for the oilfields south of Los Angeles.

They stretch for miles on the long, bare ridges that parallel the coast; an army of derricks—a hive of activity—and on the breeze is borne the acrid odour of this great treasure-house. There is a wilderness of bare, angular towers, a medley of sheds, piles of lumber and steel-casings. All day and all night the beams of the pumping-engines balance and tilt, tilt and balance, and at every stroke the earth is bereft of some of the black, thick liquor in which is concentrated the light and heat of forgotten ages. The pipe-lines squirm across the country like great snakes, charged with a precious burden, to deliver it in gigantic tanks, whence fortunes are sent to the ends of the world. There is the reiterant throb of machinery, the whine of cables, the ring of steel and the crunch of the bit as the metallic teeth gnaw remorselessly at buried strata. Down below, two thousand feet, lie the hidden sands where the treasure rests—sands that have been heaved, folded, broken, and distorted by successive convulsions of the earth's crust.

To this amazing territory come engineers, prospectors, adventurers, men of money, and men of imagination from all corners of the globe. The air is electric with possibilities. Fortunes

change hands over night. The rancher sees to his cattle, goes to bed, and wakes to find himself a millionaire, burdened with wealth he knows not how to employ. The long slopes of the ridges bask in the sun, and down far under the short grass is that which is the parent of joy, exultation, crime, and deceit. It is hard for man's better impulse to run straight amidst the prodigal inducements of nature. Good men go under, and bad men often rise to the top. Farm and factory, business and profession, property and inheritance, all are risked in this frenzied game; while ever the warm earth yields new rewards, or reveals empty shelves when at last the plunging bit ceases to burrow and dynamite rends her secret caverns.

Shanklin's heart beat quicker as this region came in sight. He had walked slowly, noting the run of the hills and the lie of the land, pitching his mind forward with cool deliberation. But he were only half human had he felt no thrill when the vast army of derricks lay before him. He wandered about for an hour, sniffing the sharp odour, noting the mechanical art that was everywhere employed. At the end of the hour he nodded contentedly. This was man's work.

A few moments later he addressed a short, sturdy, blue-eyed stranger who stood regarding intently a rising framework of timber. At a little distance a handful of men were unloading long steel-casing pipes from a motor-truck.

'Can I get a job here?'

The man glanced at him sharply. 'What kind of a job? What can you do?'

Shanklin motioned to the casing. 'I can carry the end of one of those things.'

'Then carry it—at forty cents an hour.'

In after-days Shanklin used to look back on the incident and smile, for it proved to be one of the seemingly insignificant things by which the colour of life is in all actuality determined. He could not dream that with this curt individual he was to work out his destiny in the face of unimagined difficulties. So, when night came, he only surveyed his blistered hands, and made a mental note of how many six-inch casings could be carried by a certain-sized truck, and, approximately, what each of them must weigh.

Thus began two months of dog work. At the end of the first week Harrison, the foreman, offered a better job at better pay. He did this in the blunt, off-hand manner that characterised him, and when it was gratefully accepted he relaxed a little.

'When you happened along,' he said, 'I reckoned you were a swell down on his luck; but the way you took hold of those casings put me right. How are you standing it?'

Shanklin grinned cheerfully. 'Never felt better in my life.'

'You look it. What's your business?'

'I'm a lawyer.'

Harrison's face changed a little. 'Got anything on any boss? Is that why you're here?'

Shanklin laughed outright. 'I haven't anything on anybody, except one man, and I'll get him by-and-by. I don't know who your boss is.'

'If you're a lawyer, why do you work on a rig? Hard luck?'

'Yes—and no. I've seen this game from one side only; now I want to see it from the other.'

'Reckon you're going to stay till we shoot this well?'

'There's nothing I'd like better.'

Harrison extended a sinewy hand. 'Shake, son; I'll put you through.'

II.

Thus began the intimacy which was destined to involve so much. Harrison had followed the oil business since he was a boy. Always in the field, he drilled away steadily, immune to the fever dominating the hectic life around him. He had seen fortunes made and lost, but never had he speculated. He had put down wells in South America, in the great Coalinga pools, in Texas, and even on the Caspian, where the sands of Baku vomited their riches. Now he had come back to California, where he was born, wise in his art, a quiet man with a mine of experience. Some of this Shanklin gathered in their first long talk, and it made him hungry for more.

'So, now you know why I'm here, what do you think of it?' he asked Harrison one evening, as a long, shining casing slid into place.

'That depends. Are you going into the game yourself?'

'I hope to.'

'How much money have you got?'

'Something over seven thousand dollars.'

Harrison knocked ashes out of his pipe. 'It's enough to lose. Know what this well is going to cost?'

'No.'

'About sixty thousand dollars; that's all. What you want is an oil-spring that doesn't need any drilling.'

Shanklin stared at him soberly. 'Is that true?'

'I wouldn't say so if it weren't.' The other man was obviously nettled. 'I took the contract at that price, and on the best of my judgment.'

'Oh,' said Shanklin awkwardly; 'I didn't know. It's a lot more than I thought.'

'It's always a lot more than one thinks. I have to figure on that. Then if I figure too high I lose the job. Contracting is no idle dream. It's always a guess what you will strike on the way down.'

He talked on for a while, giving intimate glimpses into his adventurous career. It was obvious that the romance of the thing was secondary in his mind. Presently he glanced up. 'Married?'

'No.'

The other man nodded. 'You're wise not to,

till you make your pile. I married early—and was away most of the time. Then my wife died after a few years. I've got one girl in Los Angeles. Don't see much of her either.'

Shanklin nodded sympathetically. He was quite settled in his mind about his new companion, and put him down as a straightforward, hard-working type, who loved his work for the sake of work. He seemed, moreover, steadfast and self-sacrificing—the sort of man who would send home his monthly cheque from far corners of the earth with unvarying regularity, asking nothing for himself but the privilege of taking care of his own folk. He would not complain when hard times came, and good fortune would never turn his head. He was, in fact, a self-respecting graduate of the school of experience, and transparently honest. Shanklin began to feel for him something that so far he had not felt for any man.

'You said you wanted to get into the game yourself,' resumed the other presently. 'Well, the best way to do that is to get in with a good crowd who know the business. You're too small a fish to operate on your own account. I've been in this thing for twenty-five years, and all I've got out of it is a five-thousand-dollar ranch that goes to my girl, and my drilling-rig—that's worth about thirty thousand. It's my capital. I sha'n't clear up more than a couple of thousand on this contract, even if we don't strike any more snags. Then, again, I may lose the well any minute. That's the oil business.'

'And these sands we're on top of now—how far do they go?'

Harrison pointed south. 'There's the end of this anticline, half a mile away. It's all underlaid by oil-sands—no big pools, but enough. Then it breaks off, and starts again half a mile farther on. There's nothing in between. A couple of wild-cat wells were put down four thousand feet. They're dry to-day.' He paused for a moment. 'You're a free man, no one dependent on you?'

'Not yet.'

'Better keep clear for a while. That farm is all I have to leave my girl, except this rig, which isn't much use to her. She said last year she didn't want it—too fond of city life. I've hardly seen her since, but——' He broke off, a sudden wistfulness in his eyes.

Shanklin did not answer. Harrison seldom spoke of the girl, but just now his mind seemed burdened with something he wanted to unload. After a little he went on with a deep rumbling voice, coloured and broken with feelings he made no attempt to disguise.

'You're not married, so you don't know how it works, but sometimes it seems that man brings up children only to be forgotten. That's the way it is with me. Maybe I'm too slow and old-fashioned, but she's all I've got. If she'd only pretend to be interested in me I wouldn't care so much. That's why I've rented the ranch.'

'She's in Los Angeles, you said?'

Harrison nodded. 'I've seen some of her crowd, and don't like them very much. They drove out to the anticline a while ago, and she kind of exhibited me as her hard-working old father. But when any one has your blood in 'em, you sort of yearn for 'em. I do. It isn't so much what's going on in her set; it's what it leads to. Seems it's mighty hard for a girl to get the right kind of a husband after that life. Did I tell you that Denison wanted to marry her, and she wouldn't—sooner work in a movie-office?'

'You mean our Denison, the drill-runner?'

'Yes. I guess he had too much sludge on his clothes. But he's white, all the way through.'

Shanklin reflected. Denison was the nucleus of the gang—straight, cheerful, painstaking, an excellent mechanic.

'If this well comes in——'

'That's just what will make trouble. I guess I'll turn in. Good-night.'

(*Continued on page 69.*)

THE MUNITIONS DISASTER AT HALIFAX, NOVA SCOTIA.

By Engineer Captain W. Smeeton Frowd, C.B.E., R.N

I.

THE great explosion of munitions, caused by the collision of two ships, took place in Halifax Harbour, Nova Scotia, on the 6th December 1917—a day never to be forgotten by those who escaped from its devastating results. An expert in explosives from Messrs Dupont's Powder-Works in New York stated at the inquiry which followed the disaster that the amount of explosives involved was far greater than anything on record.

At the time of this explosion the papers of Great Britain had little space for anything else but the progress of the Great War, and consequently only abbreviated, and in many cases incorrect, details of the explosion and its effects were given to the public. In view of this, it seems not undesirable for an eye-witness to give an amplified statement of the real facts of the case.

The collision occurred through the Belgian Relief steamer *Imo*, outward-bound, ramming a French steamer, *Mont Blanc*, inward-bound, laden with explosives for the French Government. The *Mont Blanc* was loaded at Sheeps-

head Bay, New York, with about three thousand tons of wet picric acid, dry picric acid, and trinitro-toluol (T.N.T.); in addition, just before sailing a deck-cargo of benzol was added, the French Government having instructed their representatives at New York that such a commodity was very urgently required. This benzol was the undoubted final cause of the explosion, and it is infinitely to be regretted that such an inflammable substance was placed in the same ship with the other munitions.

The *Mont Blanc* was directed to proceed to Halifax to join one of the convoys leaving that port to cross the Atlantic, and accordingly sailed there, and anchored at the mouth of the harbour late in the evening of December 5th.

The *Imo* was to proceed from Halifax to Antwerp laden with food, &c., for the relief of Belgium, and, as such, bore in large letters on her sides the words 'Belgian Relief.' As the Germans permitted such ships an unmolested passage, she did not form part of a convoy, but was to pursue an independent passage.

The morning of December 6th broke gloriously fine, with a slight haze and a few degrees of frost, and little did the inhabitants of Canada's premier port anticipate such a ghastly close to a day when all seemed so auspicious. Shortly after 8 A.M. the two ships left their anchorage, the *Mont Blanc* to anchor in Bedford Basin and await the sailing of the convoy to which she was allotted, and the *Imo* to commence her voyage from Bedford Basin across the Atlantic.

The harbour at Halifax runs practically north and south, the northern part of the harbour opening into a large inland sheet of water known as Bedford Basin, while the southern part gives access to the Atlantic Ocean. Halifax is situated on the western side of the harbour, and the town of Dartmouth on the eastern side.

The *Imo*, on leaving the basin, instead of keeping to the Halifax side hugged the Dartmouth shore. Her master subsequently claimed that traffic prevented his taking the Halifax side as soon as he should have done, and so permitting the ships to pass 'port to port.' The result was the ships approached each other 'bow on.'

Apparently the masters of the vessels simultaneously decided to alter course. The *Imo* headed off to her proper side of the harbour, and the *Mont Blanc*, dreading collision, decided to give way to the *Imo*, assuming she was not going to alter course. The action was fatal, and the two ships collided.

At the subsequent inquiry held there was very contradictory evidence as to the whistle-blasts blown; and at the action for damages, which was eventually referred to the House of Lords, it was decided that both ships were equally to blame, as neither had reversed its engines prior to impact.

II.

The *Imo* struck the *Mont Blanc* about twelve to fourteen feet abaft the bow on the starboard side, and apparently penetrated rather deeply into her. This occurred about 8.48 A.M. Immediately the *Mont Blanc* burst into flame, due, undoubtedly, to the spilling of benzol on the decks from the collision. This benzol may have ignited from a spark generated by the two vessels on impact, or, more probably, from the benzol reaching the ship's galley, which was situated on the upper deck.

The master of the *Mont Blanc* immediately realised the tremendous peril in which his crew was placed, and, manning a boat, he and the eighteen men of his crew abandoned the ship and pulled for the Dartmouth shore, where they eventually landed. Only one of them suffered death in the ensuing explosion.

The action of the captain, in abandoning his ship and reaching safety, was severely criticised afterwards because he had not given any warning to surrounding vessels as to the danger they incurred, but mature reflection convinces one that no steps he could have taken would have minimised the result of the explosion.

The *Mont Blanc*, a mass of flames, drifted towards the Halifax shore; while the *Imo*, out of control, piled up on the Dartmouth beach subsequently.

Attention was immediately attracted to the ship on fire by people on the shore in the vicinity, and a call was sent in to the fire-brigade. H.M.S. *Highflyer*, which was lying adjacent to the burning vessel, promptly sent two pulling-boats under the command of Commander Triggs, R.N., to try to pass a hawser to the doomed ship, so that she could be towed away from the piers she was approaching.

Whilst the warship's boats were so engaged at 9.5 A.M. the *Mont Blanc* exploded with a thundering crash, and a column of flame and smoke ascended hundreds of feet in the air. Evidently the burning benzol had reached the explosives, and the disaster followed.

A temperature of thousands of degrees must have been reached, and the plates and other parts of the ship, raised to a white-heat, were torn into fantastic shapes, forced upwards and outwards by the terrific pressure generated internally, and scattered over a very large area of the city. The scene that followed was indescribable. The wave of air-pressure emanating from the ill-fated vessel destroyed everything in the neighbourhood, while débris from the ship struck many unfortunate people. Sight-seers watching the burning ship from various coigns of vantage were in many cases instantly killed. The crews of the boats of H.M.S. *Highflyer* were never seen again, and the *Highflyer* herself, and H.M.C.S. *Niobe*, suffered many casualties

amongst the portion of the crews on the upper deck.

But it was on the adjacent shore that the dread calamity made itself most felt. Richmond, a suburb of Halifax, and to the north of it, received the full fury of the blast, and in an instant hundreds of houses were demolished completely, and hundreds of others permanently damaged. Many of the hapless inmates were killed instantaneously; others were buried in the ruins, and died a lingering death when not rescued promptly; and thousands were injured.

The zone of the explosion extended for about three-quarters of a mile in every direction, and in this zone the destruction was almost complete. In addition, outside the zone, the windows of houses were fractured at a distance of three to four miles, and ghastly injuries were inflicted by flying glass.

The noise of the explosion was heard as far as the western shores of Newfoundland, one hundred and ninety miles distant; and at Truro, sixty miles away, the church bells were set jingling.

The scenes in the streets after the disaster were appalling and heart-rending. Grievously injured people were rushing aimlessly about; men, immediately leaving their work for their homes, were seeking for their relatives, children for their parents; while dead and wounded human beings, horses, dogs, &c. were to be seen on every hand. None but those who actually saw can conceive the concentrated horror of the hours following the calamity. Vehicles of all kinds were sent from the city to the afflicted area, and were engaged all day conveying the injured back to the city, where they could receive such medical aid as could be obtained.

As may be imagined, there was at first great confusion, and insufficient medical aid to cope with the large number of wounded. But very soon some sort of order was evolved out of the chaos, and improvised dressing-stations were rapidly established—schools, theatres, churches, and all large buildings being utilised. The number of injured was, however, so great that many must have died before they could receive treatment.

III.

The local authorities rose nobly to the occasion, and a large number of patients, after receiving first-aid, were despatched by train to outlying towns. The Halifax railway terminus itself and its approaches were completely destroyed; but most fortunately a new terminus was fast nearing completion, and, situated as it was out of the zone, became immediately available for transportation purposes.

A really pathetic feature of the disaster was the destruction of schools in the immediate vicinity; scholars of immature age, both male and female, were discovered killed or maimed at their desks, and added no small number to the casualty lists. An unfortunate panic took place soon after the explosion, as a military magazine in the zone caught fire, and although there was no real danger, the word was passed for 'everybody to go south.' This resulted in a wholesale departure from the afflicted area, and doubtless many who could have been saved were left to their fate. Again, the fates were against the victims, for on the evening of the day of destruction a blizzard of almost unprecedented vigour—for that time of the year—set in, and the work of the rescuers was not only impeded, but rendered absolutely nugatory.

Driven by a fierce north-east wind, the snow was blinding, and rendered aid of any kind to the entombed sufferers impossible. Naval and military guards were posted over the devastated area to prevent looting, and the suffering of these guards was very severe. The harbour itself was in a bad state; ships were drifting at the mercy of wind and tide, and threatening disaster to those securely anchored or moored alongside the wharves.

A curious discussion arose as to whether there were one or two explosions in the *Mont Blanc*. People who were at a distance confidently averred that there were two, while those in the vicinity were equally confident there was only one. The explanation is simple. There was only one explosion, but it was heard twice at a distance, the period between the sounds varying with the distance.

The first report came through the earth as a medium, and the second one through the air, the earth being a better conductor of sound than the air; hence the different opinions. The first explosion—as some considered it—drew many people to their windows, and the impact of air-pressure on the windows a few seconds later caused many severe injuries from broken glass. A very large number of people lost the sight of one or both eyes—over three hundred, as a matter of fact.

Most, if not nearly all, of the houses in the devastated district were built of wood carried on stone, brick, or concrete foundations. These foundations generally remained intact, with the destroyed structure lying on them in all manner of fantastical shapes. Household goods were scattered everywhere, from the remains of a piano to furniture and cooking-utensils. The trees in the neighbourhood were either felled to the ground or denuded of their smaller limbs.

A grave, pressing need that day was the services of midwives. A big problem before the citizens that night was to provide accommodation for the thousands of homeless, but in the face of most adverse circumstances the almost impossible was achieved. Tents were erected on the common (a large open space), and the naval

and military authorities supplied blankets and other necessities as far as their means would permit. Householders who had accommodation freely opened their houses to the distressed, to the extreme limit of their capacity, and often beyond it—more praise to them!

IV.

And now, after dealing with the grievous hardships of the populace, a glorious ray of light illuminates our narrative. To the eternal credit of our kinsmen of the state of Massachusetts, as soon as the news of the disaster reached them they organised a relief expedition. That night of the 6th a train left Boston containing doctors, nurses, medical bandages and appliances, of which Halifax was so sorely in need. Their arrival was most opportune, and the services they rendered were beyond all praise. Never will Halifax people forget the great debt they owe to their cousins over the border! These services were spontaneous and gratuitous, and nobly were they rendered.

The day after the explosion was devoted to exploring the ruins, relieving the very few that survived the inclemency of the previous night, and excavating the dead. Load after load of these poor victims was taken to the stricken city to improvised mortuaries, where they were identified if possible, and arrangements made for their interment—no easy matter, as the ground was frozen hard in the cemeteries. The number of dead, identified and unidentified, amounted to about one thousand eight hundred, and the registered number of wounded to eight thousand.

The effects of the explosion, as is common with explosions, were most diverse. One house would be completely destroyed, while an adjacent one a few yards distant would receive only a moderate amount of damage. Amongst the principal buildings destroyed were five churches, three schools, a cotton-factory, a sugar-refinery, a foundry, an engineering firm's premises with graving-dock, a railway terminus, and two breweries; while great destruction was caused in the naval yard and the naval hospital, the latter having to evacuate its patients.

Many marvellous escapes from injury were reported, and the following seems worthy of recording. Three men were working on the roof of a house. The tremendous air-pressure set up by the explosion lifted them in the air to an unknown height. The pressure gradually subsided, and these men on the top of an elastic medium came to the ground uninjured. Impossible as this may seem, it is an undoubted fact!

For weeks the evacuation of dead bodies from the ruins continued, and even in the month of April, when the snows melted, bodies were brought to light.

Naturally this terrible event evoked sympathy all over the world, and financial aid was rendered with unstinted sympathy. His Majesty the King, the Royal Family, the Mansion House, the Government of Canada, and corporations and private individuals contributed most generously, and the funds were placed in the hands of a commission known as the Halifax Relief Commission. The first duty of this commission was to provide living accommodation for those who suffered by having their homes destroyed. The aid of large contracting firms was obtained, and very speedily rows of wooden houses were erected in the open spaces adjacent to the city. Several hundreds of families were thus accommodated. But the reconstruction of the devastated area presented a larger problem. The demolished buildings had first to be cleared away, and in the meantime surveyors and architects were employed to lay out and design a new suburb. The buildings necessary were to be of a type suitable for the artisan class, and it was desired to introduce every modern convenience compatible with reasonable initial cost. The material settled on for the construction of the houses was hydro-stone, this being economical in cost, easy to manufacture, and pleasing in appearance. To-day street after street of these houses may be seen on the crest of the hill, while on its slopes houses of the bungalow type have been, and are being, erected for persons of ampler means.

The Relief Commission had to deal with thousands of claims, both large and small, for property lost or damaged in the calamity; also, grants had to be made to people who were incapacitated from earning their living. The Relief Commission has now completed its work, and it may truly be said that they have done their work well.

An impression prevails with certain people to this day that the disaster was brought about by enemy agents, but a survey of the circumstances quite negatives this opinion. In the first place, the control of vessels passing in and out of the harbour was vested in the naval authorities, and it would be impossible for any evilly disposed person to ensure that his ship would meet a munition-ship in a fairway. The fact that a munition-ship was coming to Halifax was known only to one or two naval officers, and there was nothing to identify the *Mont Blanc* as being loaded with explosives. Again, the movements of the ships prior to the collision were undoubtedly not of a nature to justify a premise of intent. The evidence against intent appears to be quite conclusive.

A fact naturally concealed at the time was the damage which the naval yard suffered. This yard was the only repairing and storing base on the Atlantic shores of Canada for ships of the British and Allied fleets, and consequently was of vast importance. Situated as it was in the devastated area, the damage inflicted on it was very considerable, and not a single building remained with a roof, while many were com-

pletely destroyed. One of the boilers in the yard was struck by a portion of the main engines of the *Mont Blanc* and put out of action. Fortunately fire did not supervene in the destroyed buildings, as so frequently happened in other places, and the supplies for ships remained intact.

The naval officers residing in the yard had their residences destroyed, and had to seek refuge in ships or with friends in the city. The Royal Naval College of Canada suffered severely, and injuries to the staff and the cadets occurred, but providentially with no loss of life.

THE VOICE IN THE ROOM.

PART II.

IV.

IT was just at Christmas that another event put Macfarlane out of our minds for a little, and made Farby for a while the centre of interest to half the country-side.

In one of the little by-streets there lived a poaching, idle fellow called Jamie Dodd, and on Christmas morning his wife came round to the local police, and gave notice that her man had disappeared two days before, and had not returned.

The police, who knew Jamie's proclivities, were certain that he was off on a poaching expedition. But no one had seen him about Farby or district, and on the day after Christmas the police began to search in good earnest.

Snow had fallen on Christmas Day, but it began to melt soon after nightfall. Dr Fraser and Dolly had been up to dinner at the big house, and I had dined with a friend of mine at a neighbouring town. Dr Fraser was concerned about Macfarlane when I saw him the next day—so concerned, in fact, that he dropped the talk about Jamie Dodd's disappearance which I had started, and began at once to speak of his late host.

'Something's happening up there,' he said. 'Whether it's unjustified fear or superstition, or whether there is more in Macfarlane's theories than we think, I don't know, or care. But Macfarlane looked wild last night. He was as pale as a sheet, trembled at times, and sometimes forgot his guests altogether to stare about him in an uncanny fashion.'

'Come, Dr Fraser,' I said in surprise; 'you don't think there can be any meaning in a dying man's foolish threat or ill-wish?'

'I make no meanings of it. I only say that old Alexander hoped on his death-bed that the heir would not be happy there, and here we have the fellow fading away before our eyes.'

'He may have contracted some disease in Chile.'

'This is no disease—unless fear be one. The man is thoroughly frightened; and yet, when I got a private moment with him, he denied it altogether.'

So much for Dr Fraser. I was the next to observe Macfarlane in his new state, though the opportunity was not of my seeking.

I was walking near the house one day, taking a short cut to a patient, when I was accosted by Macfarlane himself. He was very pale; his eyes were bloodshot, and full of some strange fire.

'A word with you,' he said, stepping up. 'I will know the meaning of this, or——' He stopped, and clenched his hands.

'The meaning of what, Mr Macfarlane?' I asked.

He ground his teeth. 'Were you not in attendance on my uncle when he died, and didn't he say he would see I was never happy while I lived at Glencarlies?'

'Something of the kind, certainly. But that was no business of mine.'

'You made it your business, curse you!' cried he passionately. 'You've been jealous of me over that girl since I came. Was it not you sent somebody to the house to pass as a spirit, so that——'

He broke off, and his countenance altered strangely, as if he were frightened of his own words.

'Look here, Mr Macfarlane,' I said, as quietly as I could; 'I know nothing of your concerns. I sent no one to you. If you'll allow me, without prejudice to our strained relations, to give you a word of advice, it is that you see Dr Fraser, and get him to prescribe for you. You're in ill-health, and you seem to indulge in fancies——'

'Fancies!' he interrupted me wildly. 'He was no fancy. . . . But what nonsense am I talking?' he corrected himself. 'Well, get on to your patient quickly, and leave me alone!'

'With pleasure,' I said ironically. 'I should have been with him now if you had not detained me.'

My patient had no serious trouble, as it happened, and my mind was full of Macfarlane for the remainder of that day. What did he mean by saying I had sent some one to pass as a spirit? If he thought it a spirit he would not have used the word 'pass.' That word suggested a presence in his house at first taken for a disembodied spirit, and then discovered to be a person of flesh and blood. But who could this be? And why should he imagine me to be the sender?

V

I went back into Farby, and there I fell in with Sergeant Graeme of the police, who wanted a word with me.

'We 've found nothing of Jamie Dodd yet, doctor,' he said quietly. 'He went out that night after nothing good, I 'm sure.'

'Poaching, perhaps. But, then, you would have found him.'

'He was aye poaching on Glencarlies when he had the chance,' said Graeme, 'and I 've reason to believe he went that way the night he disappeared—only, he left his gun behind.'

'Then what do you make of that?'

Graeme reflected. 'I 'd have made nothing of it, doctor, hadn't it been that Waugh, the glazier, was sent for yesterday to mend a window in Glencarlies House.'

'Well, what of that?'

'It was significant, to my mind. The window was said to have been broken by accident like, but Waugh swears it was cut out wi' a glazier's diamond.'

I was still puzzled. 'Well, Graeme,' I said, 'that is strange enough, but it doesn't tell me anything about Jamie Dodd.'

'It would hint to me, knowing the man, doctor, that Jamie might be after other game than a pheasant or a bit hare.'

I stared at him. 'You mean that he went from poaching to stealing? You think he got into Glencarlies House by night?'

'I do,' said he.

'Then where is he now? Macfarlane did not report a robbery—or, if he did, I never heard of it.'

'No; but he 's a queer man that, doctor. There 's a change come ower him. I doubt I 'll have to make a search o' the policies and the house for that same Jamie Dodd.'

'Impossible!' I said. 'If he was in the house, Macfarlane would know about it, and tell you.'

I got no further than that, when I remembered what Macfarlane had said to me that day about some one being sent up to the house to 'pass' as a spirit. Surely this could not be Dodd, who had entered as a burglar, been detected as such, after being mistaken for a spirit, and was thought to have been sent by me in some motive of revenge? After a moment's thought, I told the sergeant what the man had said to me; and he pursed his lips.

'That 's unco strange, doctor. The man 's mad to talk like that; but mad or no', it looks as if he had seen some one in the house.'

'True. But there 's a difficulty. If Macfarlane saw him, and knew him for a burglar, would he not lay hands on him? You would either have Dodd as a prisoner, or you would have had a report from Macfarlane of his attempt and his escape.'

Graeme scratched his head. 'I 'll have to search. If he 's no about the place, no harm 's done; but there 's a mystery that wants clearing up, and it 's my duty to get the powers to do it.'

This conversation put strange doubts in my mind. No one else seemed to know Macfarlane's murderous temper, but I remembered that he had spoken of using a knife on me had he been in a country where the use of lethal weapons was less frowned upon. What if Dodd had entered the house for the purpose of burgling it, and been detected by Macfarlane, whose first natural fright at taking him for a spirit would aggravate the madness of his temper when he found out the true nature of the interloper?

But there I stopped. To go further would be to charge Macfarlane with the killing of Jamie Dodd—and yet I saw no other way out of it. Macfarlane would have no reason for concealing the attempt on his house if he had permitted Dodd to escape.

I went back sorely troubled to Dr Fraser's house, and my new worries were hardly raised even by a softer tone that I detected in Dolly when I had tea with her. She seemed more like her old self with me, as if anxious to make up for her recent neglect, but my thoughts were too much on my terrible suspicions to allow me to take advantage of the opportunity to get back on the old footing.

'I 'm not going back to dine at Glencarlies!' she said, as I rose to go. 'Never more.'

'Why not?' said I. 'Isn't he still an angel?'

She coloured a little. 'I am frightened of him,' she said. 'He often talked of seeing ghosts, and now he looks like a ghost himself.'

'I hope you 'll stick to your resolution,' I said, in a gayer tone; 'then I may see a little more of you, Dolly.'

VI.

Sergeant Graeme in due course got his authority to search the house and policies of Glencarlies, but it is impossible for me to speak at first-hand of what happened there. The authority did not include the right of others than the police to intervene, so I was unavoidably absent when they made their search. It was from Sergeant Graeme's lips that I heard what passed, and my recollection of his narrative is as follows.

He went up to the house, accompanied by two constables, and asked to see Macfarlane. Macfarlane came to him, as pale as ashes, but as furious as a rick fire, and flatly denied him the permission to enter. But Sergeant Graeme was a stout fellow, and he was armed with a warrant. He insisted on entering, and Macfarlane flew into just such a passion as I had experienced at our first meeting on the river-bank.

It came to a scuffle, in fact, in which Macfarlane acted entirely like a madman, and, for a time, withstood the efforts of the three officers

to subdue him. It seemed frenzy rather than temper, the sergeant told me; and some savage blows were struck on both sides before Macfarlane broke away from them, and dashing back through the old house, with a yell of fury disappeared in the maze of corridors and passages at the rear.

Detaching a man to follow and capture him, if possible, Graeme made a close search of the house, without finding anything to justify his suspicions that Jamie Dodd had visited it on the night of his disappearance. Having completed that task, he set to work to go through the outbuildings, and here again he found nothing of great note, until he came to a disused wash-house.

This was locked, and the door, though old, was stout. So, with his assistant, Graeme secured a log of wood, and improvising a battering-ram, speedily forced an entrance, and solved one of the mysteries of Glencarlies House.

There in the wash-house, just covered with a couple of sacks, lay the body of Jamie Dodd. His head had been beaten in with some heavy instrument, causing death, no doubt, at the moment of the blow.

Graeme at once set his fellow on guard over the remains, and dashed off in pursuit of the murderer. The motive for the deed was still obscure, it is true, but Macfarlane's conduct in resisting the search pointed to him as its author and executor.

A run took him out on to a clear space on a declivity overlooking the valley, and staring down, he saw the distant figure of the constable moving about by the river-bank. He hurried down to join him, and reached the scene in time to see the officer plunge into the black pool and dive.

The man was a strong swimmer, and emerged within a few moments grappling another figure. Graeme went in, wading, to assist him, and between them they brought the unconscious figure of Macfarlane to the bank.

They carried him into Farby, after doing what they could to restore him. He was still alive, and before he passed away he had a few moments of consciousness. He spoke incoherently, but it was not of the dead poacher that he spoke, but of that 'cursed room.'

There was talk of this at the subsequent inquest, but no one was able to furnish any clue to that mystery, and the verdict was one of death by misadventure while trying to escape arrest—which was true enough in fact.

VII.

It was left to Dr Fraser to suggest a means of solving what had puzzled us all. 'I don't believe in ghosts or apparitions,' he said to me, 'but I do know that man was scared to death.'

'I believe you,' I said. 'I am of the opinion that fear had been preying on his nerves for months, and that he mistook Jamie Dodd for a spirit, and attacked him in a frenzy of terror.'

Dr Fraser agreed. 'It's a pity we can't investigate that room he slept in. We might get the Psychical Research Society to do it, perhaps.'

I reflected. 'No, we needn't ask for help,' I said. 'If Mr James will give me permission to investigate, I will willingly spend a night in the room myself. Then I'll know what happens there.'

Dr Fraser was delighted with my suggestion, but Dolly was averse.

'Suppose anything does happen?' she said.

I smiled. We were back on the old footing again now, and my heart was lighter for it. 'Then I'll kill the owls!' I said.

In the upshot, Mr James made no objections, and in the evening, two days later, I went up to Glencarlies House and made preparations for sleeping in Macfarlane's room. These preparations were simple. I took cigars, a book, and an electric torch.

The room was panelled in ancient dark wood, a gloomy chamber, with an old four-poster bed, a vast place filled with heavy antique furniture. I had a fire lighted in the library below-stairs, and sat there reading till eleven, when I retired for the night—or part of it. As I went upstairs with my lamp I paused for a few moments to look at the old wag-at-the-wall clock, which was ticking away laboriously, and was interested to find that it (or the part containing the works) was fitted against a modern-looking carved bracket on the wall.

Within the bedroom I shut the door, turned down and blew out my lamp, and lay down on the bed fully dressed, with my electric torch ready to my hand. The place was silent, except for sundry creakings and the distant regular tick of the clock in the passage. An owl hooted, and was answered from one of the outbuildings; mice scurried behind the wainscot; but time passed, and the spirits delayed.

I did not feel drowsy, but the time hung heavy for a while. It was just upon twelve when a sound came that made me start up on the bed and listen. It was neither a groan nor a sigh, but a strange mixture of both, that seemed to come from the head of the bed. It was repeated after a few moments, and I took my torch, flashed on the light, and examined the four-poster with the greatest care.

Spirits are reputed to love the dark, but now I had what might seem a proof to the contrary. I got up, lighted the lamp, and was examining the room, when I heard a voice, oddly human, yet distant. I went in the direction from which it seemed to proceed—the head of the bed. It came again, and I heard the words, 'There's no sleep for ye here!'

For a moment I was actually thrilled by a superstitious fear, but the light in my hand

and my scientific training soon dissipated that. Energetically I drove myself against the four-poster, pushed and heaved until I had made a clear space between the head of the bed and the wall. What I saw there relieved my mind at once. It was a tiny grated ventilator, from which, at the moment I disclosed it, came the words again, 'There's no sleep for ye here!'

I paid no more attention to it after that, but I was deep in conjectures as to the cause. I remembered Alexander Macfarlane's hatred of his nephew, his reputation of being an inventor, the curious clauses in the will about sleeping in that room and keeping the old wall-clock regularly wound. These recollections gave a new meaning to my observation that the bracket behind the wall-clock was very modern, in such an ancient house, though mounting a clock at least a hundred and fifty years old.

I left the room hurriedly, and called loudly for some of the servants to come up, which they did presently, looking very frightened and not very anxious to help. At this moment I was so strung up with my discovery that I forgot I was not the owner of the place, or one authorised to cause damage in it. I had a hammer and a large cold chisel brought up, pulled down the wall-clock, and forcibly removed the bracket.

It was then that I regretted not having applied myself to the study of electricity. Behind the bracket there was a cavity in the wall, with electrical appliances of a curious kind, which had been linked up, before my rough force had smashed them, with what seemed a species of gramophone or phonograph.

Leaving the servants to stare at this, I ran again to the bedroom, and applied myself to removing the grating of the ventilator behind the head of the bed, and that done, I found new confirmation of my theory. There was a small horn there, like that used on a phonograph, and behind that, as subsequent and skilled investigations testified, more electrical contrivances.

Bidding the servants leave everything as it was found, I left Glencarlies House, and proceeded through the dark to Farby, where I knocked up Fraser and told him what I had discovered.

'You've got it, man!' he said excitedly. 'It was old Alexander's work, you may be sure. We'll telephone to Perth first thing in the morning for some one skilled in electricity, and we must ask Sergeant Graeme to step up and have a look at it too.'

VIII.

So far as I was concerned, that was the end of the mystery of Glencarlies House. Dolly Fraser confessed to me afterwards that my stay up there that night had shown her all I meant to her. She added that her flirtation with Macfarlane was merely meant to make me jealous, and that the man himself had never made any impression on her heart. That, of course, was after I had told her of my own feelings, and proposed to make a sounder partnership in the family by taking her for wife.

So the mystery had ended satisfactorily for me, though my roughness in breaking away the clock-bracket made it more difficult for the Perth expert to explain every detail of the contrivance old Alexander Macfarlane had fitted up for the scaring of his hated nephew.

Briefly, it came to this: Adapting to his needs the latest developments in wireless telephony, and adding to them a new refinement of apparatus his ingenuity had suggested, the old man had managed to link up a gramophone with a sounding-horn behind the big bed. He had added a timing apparatus, cleverly linked to the wall-clock, which delayed the operation until such time as he desired it to act. The clockwork of the gramophone business was a feat in itself, like that of one of those clocks which will go for a year on one winding.

Alexander's old man-servant, Hamish M'Cunn, supplied an important detail of information. The clock had been allowed to remain inactive for a long time, he said, but, on the afternoon of old Macfarlane's death, his master had bade him wind up the clock and see that it was kept going.

It was to that voice out of a machine that young 'Tod' Macfarlane had listened in the dead of night, until fear gripped him and brought true that automatic prophecy: 'There's no sleep for ye here!'

THE END.

WHAT I THINK.

When I am not a little boy, but grown a great big man,
I can't have half the fun, I s'pose, that now I always can;
For I shall have to settle what I'm going to be, you know,
And be the same thing all the time—which will be very slow.

Sometimes I'd like to be a sweep, with brushes and a sack—
But then I might get rather tired of *always* being black;
And sometimes I should like to drive a milk-cart in the rain—
But if I was a milkman, then I couldn't drive a train!

Now I can be a milkman, or a cobbler mending shoes,
Or a sweep, or engine-driver, just as long as I may choose;
And I can be a gardener and take my barrow out,
Or else a Carter Paterson and drive my van about.

But though I'm busy all day long, at night I'd rather be
A little tired boy again, and sit on mother's knee;
For mothers have the *nicest* arms, a little boy to hold—
And so I think I'm very glad I'm only five years old.

B. Noel Saxelby.

MOTION-STUDY IN THE WORKSHOP.

By F. Rowlinson.

MODERN industry has two notable characteristics: the prevalence of expensive machinery, and the high cost of labour. Having installed much expensive machinery, the works manager naturally desires to secure from it its maximum output; having only expensive labour to do the work, he naturally desires to secure as much work per man as possible. These ideals are the essentials of modern productive methods. How are they to be attained?

There are many ways of making an article or of working a machine in addition to the worst way and the best. In a factory where ten men do identically the same operation, there will be ten different methods of doing it, and ten different speeds. But it will be found that the man who works best, whose output is greatest, is not necessarily the man who works hardest or who takes most pains. Wherein, then, lies the difference? 'He has the "knack" of it,' you will be told, if you inquire. It was to discover what essentially this 'knack' is, and how best it could be taught to every man doing that particular job that the modern science of 'motion-study' was developed.

Perhaps the earliest work in this direction of finding the 'easiest' and 'best' ways of working was carried out by Mr F. W. Taylor. Taylor recognised that it is possible for one man to carry out one part of an operation rapidly, whilst at the same time he is much slower than the average over another part. Taylor therefore studied selected workmen in his American factory by timing their performances with a stop-watch. First of all, the whole operation was divided up into conveniently small sectional operations, and these were then carefully timed to the fraction of a second. By this means it was accurately determined what motions went to the doing of the job, what motions were unnecessary, and how long these motions took. One of the most striking facts brought out was the way in which every man invests the essential motions with a multitude of smaller and totally unnecessary motions. These might be caused in some part by special circumstances of a physical nature, such as the height of the man or the length of his arm; many of them proved to be due to some deficiency of equipment or unsuitability of environment. Definite results were now available, and from these it was easy to select a standard schedule of essential motions, to get rid of unnecessary motions, and to organise matters so that the essential motions took place in the best order. The times for the revised motions were then made standard, and piece-work was paid upon a scale based upon these standardised motions.

Taylor's methods of 'time-study' yet remain the essentials of most 'time-setters'' methods of determining basis-rates for piece-workers. They, however, are deficient in certain directions necessary for a scientific control of output. In the first place, they recorded only the times of complete operations or portions of an operation; they neither showed how that operation was effected, nor enabled a slow man to learn the most effective combination of motions to bring his time up to standard. It became obvious that a complete study should include both 'time' and 'motion.'

The cinematograph was called in to the aid of the scientific works manager. Motion-pictures were taken of the most rapid workers, and a permanent record was so obtained, not only of the work and the manner of working, but of the environment and of the auxiliary motions. By a device well known to the cinema habitué, these motion-pictures can be projected at a speed of one-tenth that at which they were taken.

Here was a method with important advantages over the old method of time-study. Not only could the films be seen more slowly and more carefully observed by the managers, but from them learners could more easily be taught the correct motions. It must be emphasised that it is impossible for a rapid worker to demonstrate to a less rapid fellow-worker by slowing down his own motions. In the performance of even a simple rapid action, and much more so in the case of certain complex industrial operations, there come into play such things as muscle-elasticity and momentum, inertia and the effects of 'swing.' These are absent or modified out of recognition when the worker slows down sufficiently for the learner to observe the details of his movements. The cinematograph motion-study can retain these special effects of rapid motion while at the same time slowing the picture to enable details to be clearly followed. A further advantage is that timing can be simply and accurately recorded by fixing a special clock with a hand revolving in a few seconds near the workman under examination. Each section of the film will then exhibit the exact time of the particular motion it depicts.

Further devices are now coming into use, chiefly with the idea of recording more closely not only the operations themselves, but the exact sequence of those operations. One of these devices consisted in fixing tiny electric-lamps to those parts of the worker it was desired to study. An ordinary camera photograph of the operation then depicted the worker only as a confused mass, but the exact motion

of his hand (for instance) might be traced from beginning to end by the bright continuous track of light it left on the plate. Various modifications of this device have been proposed, including stereoscopic views to show motions in every plane, and wire models made therefrom.

Modern works management can, by the systematic use of the methods just described, analyse and determine exactly the best possible conditions under which any particular operation can be conducted. In those works where scientific methods are encouraged the workers are then called in, and their co-operation is sought, often by means of bonuses for increased output, and similar inducements. They are taught to familiarise themselves with the selected 'best-motion,' and to practise it until it becomes automatic and habitual. In this part of the system there is, of course, nothing new. Typists, musicians, and others who have to achieve certain results as a consequence of certain movements have done this since typing and music began. Indeed, they achieve no success until they have succeeded. Who does not remember the agonising tedium of 'piano-practice' when a child? The novel part of the new methods is the systematic analysis of the component parts of the operations, and then the synthesis of selected and approved motions into the best possible combination.

It has been found that all industrial operations can be divided into what the exponents of motion-study have called 'cycles.' These cycles of motions of which a whole operation is made up are themselves composed of several 'elements.' The number of elements, of course, varies, but it has been found in practice that sixteen elements comprise all that are ordinarily required. For instance, a cycle might consist of the following elements: search, find, grasp, assemble, use, wait unavoidably, take apart. Of these it might be possible to eliminate the first two, and so save both time and energy. Another cycle might include: select, place, inspect, use, take position for next, wait avoidably, &c. Of these it might be possible to eliminate the selection as well as the avoidable wait. In a similar manner the movements of the parts of the body may be analysed and tabulated. From these tabulations, as we have shown, the best may be derived by a careful selection and elimination, with modifications where necessary.

So far, motion-study is largely a science in its infancy. Indeed, no practical application seems to have been made in this country, although a few, and those the largest and most up-to-date, of the American firms are using it. We may venture to predict that much more will be heard of it before long. At present it suffers from the conservatism of the works managers and of the workmen alike. The former distrust it because it involves much expenditure of money and time before any results can be obtained. The latter look upon it as an insidious capitalist scheme for extracting more work for a reduced wage. But when the manager realises that by intelligent motion-study he can reduce his production times to a fraction of their present values, and the worker recognises that he may save himself much fatigue through the elimination of wasted energy, motion-study will come into its own.

It must not be thought that the practical applications of motion-study are confined to the speeding-up of the human machine. The science is yielding noteworthy results in its application to machinery itself. For instance, in that type of spinning-frame known as the 'ring-frame,' the thread is spun by a traveller, which is a circular ring encircling the spindle, and fitted with a loop through which the yarn passes. The traveller is driven round by the yarn as it is wound on the spindle, and the circular motion spins the yarn as it comes from the rollers. It is found, however, that the tension on the yarn is greater when the diameter of the 'cop' or bobbin becomes greater. There is scope here for the use of the cinematograph, and it has recently been employed in this connection. By photographing the bobbin at the extreme limits of the ring-carrier during winding, with more or less thread on the bobbin, and at the lowest and highest positions of the carrier, the law determining the best speed has been ascertained. The usual constant-speed drive is now being abandoned in up-to-date mills, and variable-speed electric drives installed. The result is that the speed is at all times suited *exactly* to the spinning tension, resulting in maximum output and most economical running of continuous spinning-frames. The thread is of an even twist, and the speed of spinning may be increased by 15 per cent. in some cases. In addition, since the thread has always the correct speed in proportion to its tension as the frame moves up and down, breakages of the thread are practically negligible.

This, of course, is but an instance of an application of motion-study to a machine. There are numerous examples in almost every trade which will suggest themselves to the reader. But the field in which motion-study will most repay attention is in its workshop applications. That the new science is not being neglected in this country is evidenced by the fact that it is being taken up by the technologists. Dr Stanley Kent, of the Department of Industrial Administration at Manchester College of Technology, who is already well known as an authority on industrial fatigue, is to carry out a number of investigations on motion-study. If the new science will give us that increased production which we are told is so necessary to our industrial welfare, and at the same time yield the worker that share of leisure which he has recognised as his right, the more quickly its applications are investigated the better.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

A NEW calendar is on the wall, and never before, save on this same anniversary, has the figure '1' seemed to embrace such impressive, mysterious portent. Nothing, it is felt, is quite the same as in the careless yesterday. Here this morning, on the first day of a new year, we are flung up against time, conjured to give some new thought to questions of eternity, of space, and of life. Assuredly a new sense of responsibility seems to lie seriously upon many minds for at least a few hours on such a morning. Those of any appreciable degree of sense and sensibility do not need for its realisation the artificial aids of 'good resolutions'—often only the toy auxiliaries of weak wills—or the knowledge that a new beginning is being made in so many affairs of the material systems of our lives, the changed last figure in the year date on our newspapers (and how strange it looks, rare novelty, indeed!), and the necessity, as we apprehend it, of being as careful as were those printers not to err in the dating of our letters and the cheques we sign. In this matter a little licence is permitted for a day or two, and absolution granted for a fault upon the score of human weakness. But by the 3rd of January one is expected to know, as by instinct, the year of the Christian era upon which we are now labouring, and to have settled steadily to the new formula like good and efficient and always hopeful humans. So at the outset there is something like semi-official recognition of the disturbance in our existence. This sense of a new beginning may be a little oppressive in the introspection it demands. It is an arbitrary affair, no doubt; eternity, creation, all the mysterious forces, make no formal, figured recognition in this way of the starting of another year. To birds and beasts it may, to say it so, be at this moment either the 15th of December or the 23rd of March. It is our affair alone; yet it is an affair of consequence. Light as may be our tripping through this life, careless the manner of it, little as we may be given to thought with the faintest morbid tinge, does not one feel, or hope, perhaps, that somehow fate has wiped clean the slate of that old and bad account of the recent past, and given the chance again for a fresh start? And in an individual case this may be the last, for the controlling Nature will not for ever give such chances. It is a good thing, therefore, to set one's house in order, to tidy up the wardrobe, to rearrange beloved books upon their shelves, to cast the rubbish from the writing-table, and speak kindly, even if with an essential firmness, to those about.

* * *

With experience, and thought, and wisdom increased by a year, one may even at this impressive hour, with the calendar making limits, consider again that year-worn problem of the diary or none. And now, in such enhanced judgment and discretion, it may be reflected that life is no regular and evenly-marked-out thing; that there are periods of intensity and slackened calm; that man has moods, and his negligence must be admitted and countenanced, yet that each human life is surely worth a noted record. Reflected again that there may be nothing in advanced years so entertaining and conducive to serviceable philosophy as acute and intimate personal reminiscence, thus, and only thus, made possible. For such a confidence it is best to avoid the formal diary, with its fixed spaces and its printed dates and its 'cash account' for the months to come, which somehow seems to be the only form, the only reality, of the diary idea entering the minds of most who give a favouring thought towards the subject. A book with a leather binding, plain and small, is better; nice paper and gilt edges to accord with intimacies of our most important life. A statement of act or thought, with written dates and uncontrolled spaces, may be recorded here when, and only when, the inclination calls. This is insistent. There may be a formal note upon place and circumstance; but as in the main thoughts count for more than actions in the effort of life and the general progress, so shall thoughts in this our little book of life be as the greater things and our very own. Thus it is of the essence of the idea and its value that one shall come to the entry with an impulse and a willingness—for only so is there reality, proper self-perception—and not as a duty almost made imperative by dated spaces. One should be awake to life and the world when diary-making and thought-laying. I know much of what I did twenty or thirty years ago, but how I should like to know what

 [*All Rights Reserved.*]

exactly I thought and how I thought it, that other distant ego that is not I! And if I live other twenty years, it will interest me much more than judgments on politicians' pranks to know precisely what I thought and felt this morning when, from the window near where I write, I looked across many leagues of forest in myriad tints of green and gray over to the faint blue of far-distant hills. The newspapers may consider the game of politics to be of more account than these million trees and the rain-clouds that, with a wind behind them, are scudding from the east; but they will stand, those trees, when the politicians and all their conferences and their wars have passed away. One must approach the diary with a longing and an impulse, with a mind alert for real introspective and constructive thought, representing the truth of self, such as may be now recorded and accepted later as the clear evidence of previous personality. This is as a principle with the good diarist. Thus the little book of life may serve as stimulator, as producer of thought and constant self-analysis. This is useful, for an expedient that tends to provoke thought is more serviceable to the world at the present time than a thousand million pills, since it is because the people do not think well and clearly, and refuse to think, are too lazy to think, and hate to think, that there is so much agony on earth, and the quality of life is slipping back.

* * *

Even if it were nothing more than a matter of form, a simple expedience, we might wish in an initiatory mood like this, with a determination for a new happiness and contentment, that we might, drastically, as in the desire of old Khayyam, shatter to bits the old and sorry scheme of things—starting the world again with a new calendar and no sad legacies from the old, and no bad politicians, but only idealists whose sincerity and adaptability in the field of practice had been well tested by a committee of real experts on the reconstruction of human life. What the poor world wants, and knows it wants, what it yearns for more than it has yearned for anything since it can remember, is to escape from its miserable past and make a new beginning. But escape it cannot, and always it appears afraid of a real change over, seeming instinctively to attach itself with its overwhelming conservatism to the idea of its being better to bear existing ills than to plunge into a new unknown. There may be anarchists, Socialists, Bolshevists; you may have Liberals of the most extensive variety, Democrats and Radicals, Progressives, and Labour people, but everything shows and proves that the world in general is just an old humbug of a conservative after all. Not only does it attach itself so firmly to old systems as indicated, and, after hesitating advances, continually double back upon them, but time and again it returns over hundreds and even thousands of years to pick up again a forgotten custom from its farther past. It prattles unceasingly of its 'progress'—its desire for 'progress,' and of its 'progress' achieved; but where is all this precious progress? It has produced some wonderful inventions, it is true; but they are not more wonderful, and in the long-run and on a wide average they are not more serviceable than the things employed by the Egyptians, the Romans, and the Greeks. Chemistry and electricity are marvellous sciences, exploited with enthusiasm and a certain success, but against the service they have done us we must in sorrow set the evil that they did in war; and then on balance might it not be found that the world would have been better without this chemical and electrical 'progress'? Some may point to little things for entertainment, like the gramophone, which will let us hear again something reminiscent of Caruso's glorious tenor when he will have faded off into the historical past of song—and it is not to be denied that this instrument has yielded pleasures, educative and beneficent, to millions of people; but, thinking of Caruso, there are those who would feel the mournfulness of circumstance, as they viewed it not long ago, of a London without opera—the only first-class capital city in the world entire where there was none—and of the Royal Opera House at Covent Garden being devoted instead to prize-fighting exhibitions. It may be assumed with confidence that a hundred thousand thinkers in London rejoiced exceedingly, if within themselves, when they read that the promoters of one such blood-battering show had been obliged to abandon it for lack of support, and were losing money. Here at last was progress!

* * *

Calendars, as we know them, are good examples of the supreme human conservatism. They are most illogical arrangements, but, though the idea has been tentatively and philosophically discussed for centuries, the human mind experiences a sense of instinctive hindrance as it approaches a question of the revision of the calendar, of making it a more convenient and easily conducted thing. For years 'Summer Time,' as we have come to know it, was a fancy for theorists, and never seemed likely to be more than that, until there came the war, with its peculiar and urgent needs. Then shone out in the soft light of a setting sun this man-made marvel of the longer days. It was not merely an abandonment of old conservatism; it was clearly a gigantic revolution, disestablishment of the kind favoured when a people determined on drastic destruction to the end that a new beginning might be made. It was essentially an affair of a wide-world war. The war, not being forgotten, and certainly not having ceased to exercise its baneful influence, but rather having intensified it, has receded a few years, and

the old conservatism comes back, farmers and parents asserting themselves, so that there is a demand for the old reckoning of the day again. That same war nearly brought on the metric system, which many agree is the most logical and convenient, but conservatism just held through. Had the European conflict smashed up the whole system of things even more completely than it did, it might have brought in not merely the metric system, but a new calendar as well, for the frenzy for a new beginning and a discard of the old existence would have been intenser even than in Napoleon's days, when the last new calendar was for a time established. Things being as we know them, the calendar is just a subject for theoretic disapproval, a constant and impressive reminder of that human conservatism which displays its stubbornness never more splendidly than in the proud protection of recognised fallacies. Without being told, all at once perceive that September, October, November, and December—so plainly meaning the seventh, eighth, ninth, and tenth months—have for long been mistakes in name. The Romans led off their year with March. For the rest the titles are a jumble of derivations and perpetuated egoisms, and hardly any of them appeals to us save in an occasional way of sentiment. The months are of unequal length, and it is beyond the much-occupied human intelligence to discover the extent of any particular one of them without either referring to the calendar or reciting a verse of nursery quality and character. The days of the week do not occupy the same relation to the days of the month except by accident, though it would seem most convenient to business people and folks in general if they did (for example, the fourth day of the month might always be a Thursday); nor have the days of the week the same relation to those of the month as between one year and another, when, again, it would be a convenience if they had. It would, moreover, be quite a simple matter to arrange; and, lest the unsophisticated and the sceptical might feel that the calendar belongs to the integral system of the universe and is associated with the heavens, the stars, and the divinity of creation, it must be declared it does not, but is a simple man-made contrivance with all the imperfections of human arrangements in an aggravated form. But conservatism always did hang with affection upon imperfection as on nothing else, giving chivalrous protection to the weak, the helpless, and the deficient, and not to those who, by reason and good sense, are able to help themselves. There has grown up an idea of a calendar nearly sacrosanct, which seems to present itself as something akin to a vested interest. There is an attitude of the people that what served our ancient forebears should be good for our service too. Again, this calendar has been woven through the Prayer Book of the Established Church—which itself is being considered for revision. Further, there is a timidity as to the loss of our most respected anniversaries if the calendars were changed; for anniversaries, arbitrary dates like the rest, mere chronological assumptions, have their existence only in relation to established calendars. Our very birthdays would be lost and need a new setting; so with the days honoured in the many departments of history. Thus the old calendar, with all its imperfections, its stupidities, its enduring monument to the vanity of Augustus—who, being jealous, stole a day from another month to give it to the one named after him, so that it should be the equal of July, which was named in honour of Julius Cæsar—is strongly entrenched in human system and custom, though inferior in certain ways even to the calendar of the ancient Egyptians, who had months with thirty days apiece, and five days to spare at the end for holiday or other convenient purposes—five spare days, after three hundred and sixty all ticketed and laid out for busy occupation, being welcome then as they might be now. Who would not be happy in the enjoyment of five days so clear and free?

* * *

But it is the genial habit of the humans to speculate upon means of perfection, even though they pursue them not. Thus the idealists play with schemes for new calendars; they are doing it now more than ever, feeling perhaps that in such upheaving times their best opportunity is afforded, and that it would be no sad thing if all anniversaries of recent years—save one of final victory—might be abandoned and lost. (Victory Day might be appointed anew with as good reason as when the Government appointed one special day far on from the silencing of guns for 'the termination of the war.') Not for the first time the ingenious Americans are forward with such enterprises. There is Mr Drane, of Florida, a member of the House of Representatives, with his own ideas for setting the marking of time to rights. He lately prepared a Bill for introduction to the legislative chamber of his country upon this matter. Daring superstition upon a point at which it is often challenged in these unrespecting days, Mr Drane would have thirteen months in every year. Less ambitious than Julius and Augustus, conscious that he had disturbed the world much less, he would call by the name of Centre his new month, which he would place in the middle of the year. There are perhaps Americans to ask what is the matter with the good name Columbia at a time when that for which it stands does so much dominate in prestige and power, but Mr Drane has the statesman's vision, the statesman of the world. To each of his thirteen months he would allot twenty-eight days, bringing it about that each figure of date would always have its same day of the week. Still more daring, he would give Friday to the thirteenths.

Christmas Day is marked down for the 3rd of January. It is of less concern to us that the immortal George Washington draws the 7th of March for birthday, and that, by the new arrangement, on the 3rd of December the pious and grateful Americans would devote themselves to their Thanksgiving. But the Parliament of the country may not look kindly upon the scheme of Mr Drane. This is more than a one-man affair, and the plot against the Gregorian calendar should be hatched at some place of more historic renown than sunny Florida. Rome it shall be, the nations concerting for the plan. Come April—a month that, with its uncertainties, the English do much love, with its weeping and leafing promise, and the sigh of the poet to be in this, his native land, when April's here—there will be a grand convention in Rome, one of the most important and pretentious ever held perhaps, for the consideration of an assault in force upon a calendar in the city where it was arranged. Men of science, particularly astronomers, with a few others, have made their plans. The committee, or convention, which will be presided over by Cardinal Mercier or M. Bijourdan, director of the Paris Observatory, is one of thirty-two committees that make up the International Astronomical Union, and besides the persons named it comprises M. Lecointe, director of the Uccle Observatory at Brussels; Mr W. H. Campbell, director and Astronomer of the famous Lick Observatory in California; M. Deslandres, director of the Meridian Observatory, near Paris; Sir F. W. Dyson, Astronomer Royal of Greenwich; and Mr R. A. Sampson, Professor of Astronomy at Edinburgh University. These eminent persons aspire to bring the calendar to more perfect harmony with the sun and the stars, and they are concerned with the excessive and inconvenient variability of Easter, which always does seem to 'come soon' or 'come late.' An eminent Italian astronomer, Professor Emanuelli of the Speccoa Vaticana, has made a confession upon the ideas animating the committee. Their object, he declares, is to fashion a new calendar, which shall be invariable for every year, so that the same day may recur each year on the same date. Nothing would be more easy than to effect such an arrangement if it fortunately happened that, as with the more indefinite ages of man, the days of the year as a whole could be nicely and evenly divided into seventh parts. But the scheme of these astronomers for overcoming this difficulty is that one day shall be placed alone at the beginning of the year and not included in the calendar week at all, this day to stand apart as New Year's Day. Three hundred and sixty-four days, all amenable to exact division by the inexorable seven, will follow in due course, making up their fifty-two weeks, and the first day of each week shall be Sunday. Small February, by this scheme, shall no longer receive the concession of twenty-nine days in each Leap Year; the loose day is to be attached, with full rights of independence, to the end of June, and, like New Year's Day, is to be uncounted in the calendar, and available, as it seems, for any special purpose of approved importance for which a nation might like a day. The calendar being thus agreed upon, it would be necessary to determine the fixed time for Easter, which may now happen any time from 22nd March to 25th April. The second Sunday in April is proposed for Easter Sunday, and then all would be finished. If the reform is approved at Rome in April, another conference will follow to which would be summoned the ecclesiastical authorities, who feel themselves to be as much concerned in this affair as the students of the stars, and the question of Easter would then be further entertained and new light cast upon the problem.

* * *

With solemn respect for these seers who will assemble in the Eternal City with their scheme all cut and dried, one has that confidence in the sticking-power of old conservatism to believe that the system of the present calendar, with its dedication and consecration by Father Time, relentless still with scythe and running sand, will endure for long to come. Emanuelli, an optimist, agrees that though the April convention may pass their reform with unanimity and acclamation, it will need a considerable time for its proper and effective introduction. A matter of this kind is not to be determined, like changes in the reckoning of Summer Time, by the simple expedient of moving the hands of the clock by an hour, and going to bed on it, awakening to find all done, and one's world in a slight but impressive matter apparently changed. It is now a very old world, and should be wise, though it be not. Astronomers say it must be a hundred million years of age; geologists, feeling they know better, since they can touch and examine in their hands, and not merely gaze through glasses into vastest space, are grander in declaration, and say out boldly five hundred million years. Either way it is a long time—a very long time. It seems long enough to have learned much sense, as the saying is, even though the humans have been upon the scene, creating much disturbance and contriving ingeniously their perpetual difficulties and unhappiness, for only a small part of the period. It is suggested also, though we know not, that it has a long time to continue, and there is still the space for repentance and improvement upon the evil that has been wrought in million measure through the process of all the calendars. There may be many thousands of years still to come. The other day an astronomer of parts, Captain Marriott, was reckoning that the earth has now reached its utmost heat—which none who passed

through the sun trials of last summer would dispute. He marks an epoch of thirty-two thousand years for the ascent from the glacial period to the hottest, and the return again to the glacial, and says we are now half-way. Only sixteen thousand more years to roll, and then the ice shall lay its stiffness upon it all again. But even that also is a very long time—so long, indeed, that it touches us with small concern; and still, with that old assurance and our kindly disposition for posterity, we shall call upon the lawyers and order the parchmenting of leases for ninety-nine years, which is the longest period ordinarily coming within our personal and testamentary comprehension. Now, precisely, we open one of the millions of years that are untouched, unused. The stiff and bold and portentous '1' in all its aggressive youth—and, alas! we who have known these '1's' before would say in all its ignorance too—stands forth upon the wall. It is a time for boldness with a smile and to determine well, and so—*Allons!*

MAN'S WORK.

CHAPTER III.—*continued.*

III.

HARRISON disappeared into the sleeping camp. Shanklin moved a little farther from the incessant cough of the engine, lay on his back on the long grass, and peered up at the stars. He drank in the cool, sweet air, and felt the benison of night steal through his body. He was nearly happy. But so often as the buoyancy of youth tingled in his veins, just so often was he conscious of an intolerable longing for the girl he loved. He had reckoned that work, ambition, and fatigue would go far to heal his spirit; but Claudia, he discovered, had wound herself too closely about his heart for any such substitution. He knew that he would always worship her—but the intensity of that worship, which now, deprived of its object, was steadily increasing, baffled him altogether. He did not want to feel as he felt, but he could not help it. Her lissome grace, the tones of her voice, the fragrance of her body, the sweet appeal of her eyes and lips, the wistfulness, the ineffable promise of future joy and a divine partnership—all these he had sacrificed in what Burley indignantly called a fit of altruism. Now he was in pursuit of the treasure of the earth, having forfeited the treasure of his soul.

He passed from this into a grim reflection of what Sitwell might be doing now. He knew the man's skill and artfulness, and the coast was clear. A companion in Brooks's trickery, Sitwell would wield a definite power over the older man, and, with Claudia at stake, would not hesitate to use it. As to Brooks himself, Shanklin felt that somehow he had understood, that he secretly approved of his critical attitude, and had not taken real offence. It was Sitwell who had grasped the opportunity and made the most of it. At this very moment he might be with Claudia, suave and dangerous. Shanklin's fingers clenched at the thought of it.

He lay for an hour thus. A mile away, in the valley, a single light blinked from a small farmhouse, and it came to him suddenly that there or thereabouts was the property, the title-deeds of which Brooks had put before him only a few weeks previously. Oil! He smiled at the thought of it. All his assumptions had been verified by his talk with Harrison. What if that *were* the property, and he could from his vantage-point watch the operations of Sitwell day by day. The idea piqued, and in a curious way comforted, him.

He came off the night-shift one morning a week later, and struck across country. Between the great anticline, where was Harrison's contract, and the farmhouse, ran the highway that led from Los Angeles to San Juan Capistrano and San Diego, along which a succession of motors flashed like shining beetles. He stood for a few moments watching them, recognising now and then acquaintances of his own, who saw nothing familiar in the stained overalls he wore. The thing amused him. How easy it was for a man to lose himself in civilisation! In half-an-hour he was staring at a newly painted sign just outside a wire fence: 'The Enterprise Oil Company —Non-Personal Liability.'

So that was it! A few sheep nibbled at the scanty grass, for the land was poor, and not irrigated. Behind the white adobe farmhouse spread the remnants of what had once been a garden. Beside the door were two cabbage-palms. A little way off was the well, which, judging by the vegetation, Shanklin surmised as alkaline. Two miles eastward commenced the foothills. In the middle of the tract lay a pile of timber, and two men with saw and hammer worked leisurely over the erection of a small shanty. And that was all. He smiled grimly, and struck up the hard earth path that led to the front-door. At his knock a man appeared, tall, lean, and unshaven, fit occupant of this unkempt domain.

'Can you give me a drink?' queried Shanklin.

The man pointed to the well. 'Help yourself. It isn't very good, but I'm used to it.'

The water was alkaline, and Shanklin only moistened his lips. The rancher lounged in the shade of a cabbage-palm, regarding him indifferently.

'Been here long?' asked the visitor, putting down the tin dipper.

'Too long for me; the land is salt, and I'm getting out.'

'Sold the place?' Shanklin glanced at the wooden sign.

The other man nodded. 'About six weeks ago.' He paused, and a grin slowly spread over his long face. 'Some fellows in the city bought it. I've an option on it at the end of the year for half of what they paid. I can't lose, and that's about what it's worth.'

It all seemed like Sitwell's work. At the end of the year they would sell the place back, and pocket the proceeds.

'In oil yourself, aren't you?' asked the rancher.

Shanklin nodded. 'Working with Harrison on that anticline.'

'Those fellows who were here let on they thought there was oil here; but—well—I've been in the business myself.'

'You get a royalty if they strike any?'

'Fire and brimstone is all they'll strike if they go far enough. However, that's their end of it.'

'Did they offer you any stock?'

'Sure—a wagon-load—but I wouldn't touch it. The kitchen's papered with stock that's no good.'

The man rambled on, and when he had finished the tale one phase of the Enterprise Oil Company was complete. He was indifferent whether Sitwell did any work or not. Shanklin hazarded something about the fate of people who put money in such schemes, but Trent, the rancher, regarded these individuals as being expressly created for the relief of men like himself. He called it the doctrine of compensation. Shanklin left him on his doorstep, and tramped back to the sleeping camp filled with silent and utter revolt. It was on the future of this sort of thing that Claudia's fortunes depended. Her nature was foreign to its purport and trickery.

That afternoon, when the hunger for her was sharper than ever, he caught her name mentioned in the personal column of a Los Angeles paper. It was the notice of her marriage to Sitwell two days previously.

IV.

Claudia had not entered the marriage under any illusionment. Her love was in fierce conflict with her pride. That Shanklin had dared to entertain suspicions of her father filled her with instant and passionate protest. She was aware that the intensity of her reaction was moving her nearer to Sitwell, and her father's anxiety to see her finally settled had not only touched her, but given her as well definite feelings of apprehension.

It was in secret moments that she confessed to herself how much it all had hurt. The dream and vision of youth in the arms of youth had vanished. She had counted on a companionship as sweet as it was intimate, and was about to exchange it for a partnership in which she seemed to be depositing her own person in payment for her father's peace of mind. Sitwell could never rouse her to the depth of yearning she had experienced when Shanklin's arms were round her. She admitted to herself that she would marry him, but at the same time realised that what she could contribute to that marriage would be something very different from the supreme offering she had been so recently prepared to make.

Sitwell gave her back the ring she had returned to him a year previously. It was worth a dozen like the simple token which Shanklin had left on the table one eventful night, and which she kept because it recreated memories she was loath to silence. He was not in any way triumphant, but it appealed vividly to his sense of pride and ownership that Claudia should be his.

Courtney Brooks, as though he had held on to life for this particular purpose, died suddenly and quietly two weeks after the wedding. For some days he had oscillated between the office and his apartment, seemingly depressed by the scanty returns that dribbled into the Enterprise treasury. Claudia watched him breathlessly—he was so unlike the father she used to know. One evening, when Sitwell was out, he beckoned to her, and she sat holding the big hand that appeared strangely limp. Then he began to talk, wandering back, as he often did of late, to the days of his own youth, stopping now and then to regard her with wistful affection.

'You're like your mother, girl—more like her every year—same eyes and lips—same way of carrying your head. Happy with Bertie, aren't you?'

'Yes,' she said brightly, 'very happy.'

'I'm glad of that—very. It isn't always easy to understand Sit—never quite unravelled him myself—but he ought to do well. He impressed folks as I never could.' He smiled a little. 'Perhaps I never tried. Sit is determined, and once he goes after a thing, he'll chase it into the ground. I never know how much he feels things just on account of that cool air of his.'

'He's awfully good to me, father, and thinks of every little thing.'

Brooks nodded. 'You remember what I told you about the oil promotion business?'

'To get Bertie out of it if I could?'

'Yes; clean up and get out. When I think of the years I put into it, and now——' He broke off, a dull flush rising in his cheeks.

The girl regarded him closely, with the sudden conviction that in spite of all his cheery calm her father was a disappointed man. He had never been extravagant or self-indulgent, but wanted money, it seemed, only to spend it on

herself. It moved poignantly in her mind that he was harassed with fear for her future. She noted the weariness in his eyes, the lassitude of his body, and was filled with courage and swift resolution.

'You mustn't worry about anything,' she entreated quickly. 'Bertie is going to do well, and I 'll back him up and help him to the limit. You 'll take things easier now, and let me look after you.'

Brooks patted her hand and looked slowly round the room. He felt as though his very spirit were deliberately detaching itself in his breast. He was sick—sick at heart. Here, close beside him, was the child of his early passion, compassing in her sweet body all the potency of womanhood, beautiful, trusting, loyal. The die was cast, and at his own wish. In his soul of souls he had always disliked his partner, but it seemed that there was no substitute. To this partner he had not only yielded his own views of what was decent and straight, but had also offered this girl with her fire, her beauty, and promise—and both offerings had been accepted in Sitwell's cool and imperturbable manner, as though these sacrifices were his by right. Brooks inwardly cursed him for the manner of the taking.

He pondered helplessly over what test of life lay ahead of this girl of his; for the test, he felt sure, would inevitably arise. She would win through; but at what cost? Then there came to him a moment of comfort, and he saw dimly that in the law of life each individual is given the making or the marring of his own existence. God—how strange the word sounded!—would look after the rest.

There came a great silence in his ears, after which he heard a confusion of voices, very far away. Then the girl's anxious face grew strangely indistinct. He put out an uncertain hand, felt blindly for the dark, brown hair, and pressed it caressingly.

'Claudia,' he whispered, in a voice that had grown suddenly thick. 'Claudia—for——'

The voice faltered; the eyes took on a stiff, visionless stare.

(Continued on page 87.)

SMUGGLING SACCHARIN.

By a Revenue Expert.

SINCE the imposition of the tax on saccharin by the Finance Act of 1901 there have been numerous attempts to smuggle it into this country. Many clever devices have been used to outwit the Customs officials. But all these have been detected and catalogued. Moreover, the officers are constantly on the look-out for the latest dodges of the saccharin-smugglers to evade the payment of duty.

Now that the tax stands at eight shillings and threepence per ounce or six pounds twelve shillings per pound, the temptation to run the risk of importing saccharin free of duty is no doubt a great one with unscrupulous traders.

In order to guard against smuggling, the statutory regulations of the Finance Act of 1901 restrict the importation of saccharin to London, Southampton, Newhaven, Dover, Folkestone, Harwich, Grimsby, Hull, Goole, West Hartlepool, Leith, and Grangemouth. Moreover, packages of saccharin must not be less than eleven pounds net weight. It frequently happens that the saccharin-smugglers endeavour to get supplies into this country through the other ports of the United Kingdom. They reason that the officers at these ports are not looking out specially for saccharin, and that, therefore, the chances of detection are not quite so great. But very often they receive a rude surprise, for all British Customs officers are men with a highly specialised training.

As a general rule the smugglers concentrate their efforts on getting saccharin through the Customs by describing it as some well-known product, such as health-salts or sugar or farina or salicylic acid. The top portion of the tin or other receptacle answers all the tests for these products, but closer, or rather deeper, examination reveals the existence of saccharin in a separate packet or a false bottom. Sometimes the saccharin is merely separated from the upper layer by a disc of cardboard or tin.

Saccharin is a by-product of coal-tar. Its chemical name is ortho-sulphobenzoic imide. In its usual form it is a white glistening powder, several hundred times sweeter than ordinary sugar. If the tiniest grain is placed on the tongue, it will leave a sweet taste in the mouth for a considerable time.

At one time the officers could rely on the tasting test as the best means of detecting saccharin. Recently, however, a process has been discovered by which it can be denatured or deprived of its characteristic sweet taste and appearance. This camouflaged saccharin bears an extraordinary resemblance to ordinary bleaching-powder. If it succeeds in passing the Customs examination without detection, it is taken away and reconverted into its original state. This dodge is, of course, an expensive one, but if one ton got through the Customs the importers would rob the revenue of £14,784.

Attempts are often made to smuggle saccharin mixed with other goods. For instance, it has been found in sugar, starch, ground roots, and

similar articles. Then, again, it is sometimes described as 'chemical goods,' 'drugs,' or some such special name as 'lycose' or 'paracul acid.' When the officers examine a product with an unfamiliar name, they invariably take a sample for chemical analysis.

The officers must examine 'wet goods' as well as 'dry goods' for saccharin. Harmless-looking colourless syrups intended for use in the manufacture of mineral waters may contain saccharin in solution. There is also a possibility that it may be imported in glycerine or even water.

Not long ago a consignment of cheap toys was examined by a London Customs officer. He opened one of the toys—a teddy bear. Picture his surprise when he found that it contained several ounces of saccharin! The other 'teddies' were similarly stuffed.

Saccharin has also been discovered in specially constructed table-tops, in various receptacles skilfully hollowed out in cheap furniture, and in bundles of canes. Occasionally, too, it has been found in passengers' luggage. On several occasions a personal search has revealed comparatively large quantities secreted in wearing-apparel.

It must also be remembered that imported products in the manufacture of which a certain percentage of saccharin is used are liable to duty at the saccharin rate. If, however, the proportion of saccharin present is less than 1 per cent., duty is not charged.

When it is considered how numerous are the articles in which saccharin is used as either a preservative or a sweetening agent, it must be admitted that the Customs examining officer's work is extremely onerous.

THE TEST.

By W. D. Gray.

I.

IT was on the morning of the tenth day after leaving the Farthest South camp that Fanshawe finally reckoned up the chances. He was cook for the day, and rose before his two companions. As he scrambled out of his frozen reindeer-skin sleeping-bag his face was composed but grave. There was no doubt it would be a close thing, a very fine-run thing. All the dogs dead, three men to haul the sledge, and two hundred and forty miles yet to the hut and the ship.

Unlacing the tent-flap, he went out to get the food from the sledge. It was a fine morning; the sun shone down brassily from a clear sky and lit up the white, frozen desolation. For the thousandth time Fanshawe was aware of the strangeness of that dead expanse of snow and ice, all silent and motionless in the stringent cold. There was something about it, something austere and aloof, something foreign and exotic, which seemed to cut it off from companionship with the kindly earth, man's native home. The tiny tent, the sledge, Fanshawe's moving figure showed up as little black specks, infinitely small and trivial on the great, cold, glittering plain. Here was the primeval, unchangeable and untamable, as it had been from the beginning. The spirit of the Antarctic brooded over that immense loneliness, a spirit beautiful but terrible, bidding men take heed how they braved its fastnesses. And in answer man's voice seemed to be heard—small, faint, yet indomitable—'We will take heed, but we will brave them.'

Fanshawe felt all this dimly, but he contented himself with saying half-aloud, 'Well, thank goodness, it looks like being fine and calm for the next twelve hours; we might do fifteen miles to-day.' He carefully carried the food into the tent, and lit the 'primus' stove. It was the food that was the great, the dominant, factor in his calculations. By an immense amount of patient ingenuity he had brought down the daily ration for the sledging-trip to just over thirty-four ounces per man, yet he flattered himself that there was more nutriment in it than in the supplies of any expedition of the past. But, having regard to all the misfortunes and delays of the past weeks, would their food now take them back to their base?

Once again he worked it all out. Yes, given average weather and average luck, it would do so. He bent his dark bearded face over the stove and smiled grimly. That was the point; that was the everlasting point in the Antarctic. A week's furious, yelling blizzard would keep them chained inside the tent, and all his calculations would be upset. He shrugged his shoulders moodily, as the snow in the stove melted and began to steam and simmer. They must chance it; in fact, that was all they could do. He reflected, a little proudly, that they deserved to come through. His was a small, privately equipped expedition. They had attacked the Antarctic on a little-known side, and had achieved great results. This southern sledging-party had reached the eighty-sixth parallel, and had discovered a great tract of new land—a hideous desolation of ice and rock, but indisputably new land. They had found two mountain-ranges and half-a-dozen great glaciers, while their scientific discoveries were not less interesting. Few explorers had done so much with such small resources. It was on their

return to their base on the coast that misfortune had pursued them. The dogs had all died of some mysterious disease. One sledge had had to be abandoned; even to pull the other was a hard task for the three men. Yes, they deserved to come through—but the spirit of the Antarctic held the last card.

II.

Fanshawe pulled off his wolf-skin mitt and took out his watch. Time to rouse the others; the food would soon be ready. He glanced at them both as they lay huddled deep down in their sleeping-bags, so closely covered that it was impossible to see their faces. The man on the right was his younger brother Arthur. The bulky figure on the left was Pardew. He considered them attentively for a few moments before waking them. They represented the human factor in his calculations, the factor which might wreck his arithmetic not less than the Antarctic blizzards. He endeavoured to think of their qualities coldly and impartially. Both were very strong and fit, or they would never have been his companions on this southern journey. Pardew in particular was a positive Hercules, apparently absolutely untirable. It was their mental qualities which made Fanshawe wrinkle his brow thoughtfully. They were sharply contrasted. That young brother of his, of whom he was so fond, had begged so hard to be one of the southern party that he had not had the heart to refuse him. Undoubtedly Arthur Fanshawe was a charming young fellow, gay, enthusiastic, full of life and energy. But the Antarctic wilderness, that acid test for manhood, had brought to light certain flaws in his character. He was very mercurial, full of ups and downs, immensely elated when things were going well, bitterly and unduly depressed when troubles accumulated. And certainly, during the past weeks, there had been troubles enough; only a very strong character could have risen superior to such trials. But in the Antarctic only very strong characters are required. Young Fanshawe had charm; he had strength of body; yet, unwillingly enough, his brother doubted a little if he had the steel-hard strength of mind of the true explorer.

The leader considered the third member of the party. Besides his immense physique, Pardew had the strong recommendation of experience—he had been out before with another expedition. He was a difficult man to sum up. If his character had strength, it certainly manifested a notable lack of charm. He was a man of brains and education, but there was something saturnine about him, something gloomy and morose, even surly. He did not complain; he did his share of the work, but he did it without any gaiety of heart, in a wooden, dull fashion. Fanshawe imagined, moreover, that beneath the man's taciturn and heavy exterior there was a suggestion of hidden fires, a hint of danger. If it ever came to a point, he thought Pardew would be an ill man to quarrel with. An instance of his curious sullen cast of mind had occurred twelve days ago. They were going over a tract of old ice, covered thick with snow. Pardew was leading in front of the sledge, and suddenly fell headlong through the snow-crust into a hidden crevasse. Fanshawe had rushed forward in an instant and flung himself down on his face. He saw Pardew wedged perilously some four feet beneath, in imminent danger of slipping farther into the unknown depths below. Calling to him not to move, Fanshawe uncoiled the rope he had slung over his shoulder, ready for just such an emergency, and flung it into the other's hands. Then he called to his brother, and in a few seconds they had pulled him to the surface again, safe and sound. And Pardew had merely muttered a few words of thanks, apparently more annoyed with himself for falling than grateful for his deliverance.

Fanshawe brooded over his companions for a few moments longer. He had been thinking of their weak points, for in a wilderness a man is more often lost by his weaknesses than saved by his virtues. And yet, taking them all in all, he could not have hoped for two better men. They had followed him gallantly; they had endured; they had achieved. And if his brother was sometimes despondent and complaining, if Pardew was gloomy and surly, other men under the same rigorous conditions might simply have lost heart altogether, and lain down and died.

He bent over them and shook their shoulders. 'Time,' he said simply. 'Rouse up, young un. Rouse up, Pardew. It's a fine morning; we must be away early.'

The two men opened their eyes, grunted, and began to heave themselves out of their stiff sleeping-bags. These were carried outside, and then began the usual morning toil of putting on the *finnesko*—the reindeer-skin fur boots, which had frozen stiff and hard during the night. It was accomplished at last; the thick savoury 'hoosh' of pemmican and broken plasmon biscuit was greedily gulped down, followed by steaming cocoa. When all was portioned out the stove was instantly extinguished, to save the precious oil. Half-an-hour later the tent was struck; everything was packed and strapped to the sledge. Fanshawe gave the word, and they set off once more, three little black specks upon the monotonous whiteness, like flies crawling painfully upon an immense and ever-expanding ceiling.

III.

That was a good day; the fine, calm weather endured immutably, and they did fourteen miles. Ever afterwards Fanshawe looked back upon it and upon his light-heartedness with a kind of

wondering unbelief, for it was the last of his good days. That night when they camped he made his terrible discovery. The evening meal had been eaten, and his two companions were already in their sleeping-bags. He had lingered outside to look over the sledge and see how the runners were standing the hard going. Something, some instinct, made him also overlook the stores. He came to the biscuits, of which they had two cases left, one full, the other half-full. He idly opened the one which should have been full. It was half-empty.

For a moment the blood left his heart, and the white desolate icefield seemed to revolve round him in a circle. Next instant he chided himself for his foolishness. 'I have opened the wrong one,' he thought. 'It is the other which is the full one.' He opened the second case, and that also was half-empty.

He looked at them unbelievingly, as though doubting his senses, then fastened on the lids swiftly, and stood up. For a little he remained quite quiet, gazing into the distance, his face dark, his mouth shut like a steel trap. He did not think, he *knew*, that both the cases had been full when they left their base. He had personally examined the sledges, the provisions, the scientific instruments—every single detail of the equipment. He knew his business, and he could not be deceived. But then—what followed? He clenched his hands, and, despite the cold, the perspiration broke out on his forehead. There had been theft. For days, perhaps for weeks, one of his companions had been stealing these biscuits, the precious food which meant life to them all. Swiftly came the question: How was it taken? Simply enough, he said to himself; they all took it in turn to cook the meals—the thief had every opportunity on the day he had charge of the provisions. Not less swiftly came the second question: Who was it—which of them was it?

Something wild and fierce and bitter swelled up in Fanshawe's breast. 'It was Pardew,' he muttered half-aloud. 'It must have been Pardew! Arthur could not have done it; he's not capable of it. I'll swear he's had no hand in it. Yes, it was Pardew—but I must have proof, absolute and certain proof.' He swallowed down his anger and commanded himself. He must catch the thief in the act, if at all possible. That should not be difficult. To-morrow it was the turn of his brother to be cook, and the day after that of Pardew. He would keep watch that second day; indeed, he would be quite fair and also watch his brother. But it was not Arthur; it was impossible that it could have been Arthur.

Fanshawe sighed deeply and entered the tent, lacing up the door behind him. The other two were already snuggled deep down in their sleeping-bags, and as he got into his own they wished him good-night sleepily. 'Oh—good-night,' he muttered heavily. There was little prospect of a good night for the leader. He had a sudden mad impulse to cry it all aloud, to fall upon Pardew, stretched out beside him, to take the man by his bull-neck and choke a confession out of him. He mastered himself again and lay quiet, his eyes fixed on the tent canvas and his brain on fire. 'How could Pardew have done it?' he said to himself. 'How could any one have done it?' To steal food on a sledging expedition was a terrible crime—it simply was not done. Food occupied such a prominent place in existence, the raging sledging appetite was such a torment, that the man who thieved from his comrades placed himself beyond the pale.

IV.

That was a very long night, or, rather, a very long period of time, for there is, of course, no true night in the Antarctic summer. At last, as Fanshawe lay shivering in his sleeping-bag, he heard his brother stirring and moving beside him. It was half-past six, time for the cook to set about preparing the morning meal. Young Fanshawe crawled out of his bag, and, unlacing the flap, vanished quietly from the tent. 'I must see what he does,' thought the other. 'It's a hateful business to spy on him, but I must do it, in fairness to Pardew.' He wriggled out of his own bag, and peered out through the opening of the tent. He saw his brother busy getting the pemmican, biscuits, and cocoa for the breakfast. Arthur laid the rations ready on the top of the sledge, and then paused a minute and seemed to listen suspiciously. Pardew was snoring noisily within the tent, and the listener smiled as though reassured. Then, to Fanshawe's unutterable horror, he saw his brother quickly remove the lid from the second case of biscuits and slip two or three of them into his pocket.

Fanshawe drew back from the tent-flap, feeling as though a cold hand was gripping his heart. There was no possible doubt now. Provisions were missing: he had just seen his brother take them—his brother, Arthur Fanshawe, was the thief. Half-consciously he crept back into his sleeping-bag, Pardew still snoring at his side. Arthur had stolen from his comrades—young Arthur, his kid brother, as he used to call him. It was unbelievable; yet it must be believed, and the situation must be grappled with. What was he to do? First of all, the stealing must be stopped. But how? By a public exposure? All the man's proud and sensitive spirit shrank from that course. He could not admit Pardew, a morose and surly stranger, to the family shame. Indeed, there might even be danger in it, for if Pardew knew of it, he was not the man to take the knowledge quietly. Those hidden fires might blaze up; there might be murder done. No; he would wait and

deal with his brother quietly and alone, when they got back to the hut—if they ever did get back. Yet, in the meantime, it must be stopped. He decided that for the future he would take sole charge of the provisions; he would announce that, instead of taking duties in rotation, he would always do the cooking, and the others would also have permanent duties. In this way there would be no further chance for Arthur to disgrace himself; and if the unhappy boy guessed from this alteration that he was suspected, why, so much the better.

And, secondly, there was the question of the food-supply. Long before they reached the hut that second case of biscuits would be needed, and, if the present rations were still served out to all, there would not be enough. In that case the whole thing would come out. Fanshawe compressed his lips. He could only think of two methods of hiding the shortage from Pardew. He could say that the biscuit-case must have been half-empty when it first left the ship. That would be untrue; and he could not bring himself to assert a thing which was not only untrue, but highly discreditable to himself, as leader and organiser. Well, if he did not do that, the only way was for him to go short. He could pretend to be off colour, to be falling sick and losing his appetite. He made a mental calculation. If he cut himself down to two biscuits a day instead of the six they were now having, the case might just last out, and his brother's shame would remain hidden. He would do it. It would be no light thing, but he would do it.

V.

By the time Fanshawe had finished his bitter meditations and thought out his scheme Arthur had the meal ready. Pretending to awake from a sound sleep, Fanshawe yawned heavily and stretched himself. As he took his sleeping-bag out of the tent and wrestled with his frozen fur boots, he thought he had better announce the change in the day's routine at once. It would put an end to any further stealing, at all events.

'We 'll have an alteration in our arrangements,' he said, as the breakfast was finished. 'In future I 'll take charge of the provisions and always do the cooking. It will be simpler. You two can also have your own definite jobs all the time. One can see to the tent, and the other pack the sledge.'

He looked in his brother's face as he spoke. Young Fanshawe seemed to shrink within himself and his eyes sought the tent floor, but he said nothing. Pardew stared in frank surprise.

'It 's as you please, of course,' he said, in his deep, toneless voice. 'But it will be a rotten arrangement for you, won't it? Cooking 's not much of a job, and it 'll mean that you will always have to get up earlier.'

Fanshawe waved away his objection. 'That 's all right,' he said. 'As for the cooking, I rather fancy myself as a *chef*. I believe I can serve up pemmican more tastefully than either of you two amateurs. At least I 'll have a good try. So the new arrangement will start to-day.'

No more was said. He was the leader; it was for him to order, as Pardew had hinted. As they packed up and prepared to start the day's march Fanshawe felt that, at any rate, there would be no more stealing. But his heart was heavy; he had seen his brother's face, and he believed the youngster knew he was suspected. There remained now the harder task of saving him from open shame.

And it was a hard task. It seems a simple thing to eat only two large plasmon biscuits a day instead of six, when one has pemmican and cocoa as well. But in the Antarctic, in the infinitely pure cold air of the icefields, hunger is a terrible thing. Immediately a meal is finished, the one burning question is the nearness of the next. Food, food, and yet again food—that is all men can think about. All come down to the common level—the scientist, the university scholar, the cultured gentleman—there is no escape from the grip of the sledging appetite. And for a man voluntarily to deprive himself of food, under the pretence of sickness, demands some courage. But Fanshawe did it.

On the second day after he had taken charge of the provisions, he declared that he felt a little seedy. It was nothing much, he added; only he was off his food—he did not care for the hard biscuits. He would just have one in the morning and one with the evening meal. He would make up with the pemmican; he could fancy that better.

At first his two companions were seriously alarmed. 'You don't think it's scurvy, do you?' asked his brother anxiously.

'Scurvy be hanged!' returned Fanshawe irritably. 'Of course not. I 'm only off colour a little. I expect I shall be all right in a few days.'

'Queer you should lose your appetite, though,' said Pardew thoughtfully.

Fanshawe shrugged his shoulders. It was rather queer, he agreed.

If the other only knew that he was possessed by a raging appetite, that he had horrible and unavailing dreams of juicy beef-steaks, visions of unlimited eggs and bacon, Christmas turkeys, and all good things to eat, then he might have thought it still queerer.

VI.

The days went by. The three little black specks and their sledge still toiled painfully along in the midst of an immense and dazzling whiteness, a desolation profound, austere, and beautiful. As Fanshawe felt himself growing slowly weaker, he had a nightmarish impression

that they were not moving at all, that they remained in the centre of a huge icy circle, and that they would wear the rest of their lives away in endeavours to escape from it. In reality they made good progress. There was no day in which they did less than ten miles, and often they did twelve or fifteen. For once the sombre fates of the Antarctic were kind to them. The weather remained fair; if it did blow, the wind came from the south, barbarously cold indeed, but not in their faces, and not such a blizzard as to force them to camp. And the going was good; the *sastrugi* (the waves of snow piled up by the wind) were small and easily negotiated; the surface was hard and firm. But it was desperate work for Fanshawe. Soon his sickness was no pretence; it was all he could do to force himself along at the end of a march. He would not give in; he was determined to endure to the end. Certainly no ordinary man could have done it. Fanshawe had been endowed with an iron frame, an iron constitution, and an iron will, and all three were stretched to the uttermost. Not the least of his trials were his companions' anxious inquiries, their suggestions that he would be better if he forced himself to eat his full ration. Sometimes he saw the humorous side of it: the idea of forcing himself to eat what his whole being was avid and craving for struck him as being rather amusing. But, more often, he felt like gnashing his teeth. At times he saw Pardew looking at him anxiously, and wondered what was in the man's mind. No doubt the fellow was curious as to this strange sickness; he had been South before, but this disease would be new to him. Well, he would have to remain curious.

At long last the interminable journey began to draw to a close. They were within fifty miles of the hut, the day after they were thirty-seven, and the next day twenty-six. Fanshawe's strength was ebbing fast, but his spirits rose, for the miles were vanishing still faster. He had been watching the provisions as jealously as a miser watches over his gold. They would just last out. Always provided the weather held fair, they would just last out. And there had been no more stealing; that had ceased from the moment he had made the new arrangement. 'We shall do it!' he thought exultantly. 'We shall do it!'

And now they camped within seventeen miles of their goal. Fanshawe roused his companions very early next morning. 'We'll make a long day of it,' he said earnestly. 'We'll get to the hut at the end of this march—or bust. What do you say?'

Both agreed instantly, for they also had an aching desire to be done with it all. It was the last lap, the last stage on the long road. Years after Fanshawe marvelled how he endured that last day's travelling. He swayed and rocked on his feet from sheer weakness; at times the solid ice beneath him seemed to sway up and down like a ship at sea, and a deadly faintness overcame him. He set his teeth and went on. Ten miles more—five miles—three miles. Now they made out familiar landmarks they had known through the previous winter, now they came to the crest of a well-known slope, and now they saw the hut below them, and the black figures of their companions pouring from the door and pointing towards them. Pardew gave a great roar, like a bull's bellow, and waved his arms, while Arthur laughed hysterically. Fanshawe halted. His weakness made him feel childish; he had an insane impulse to burst into tears, to babble foolishly and incoherently. He commanded himself for the last time. 'Well,' he said quietly, 'that's that. We've done it.'

VII.

It was about ten o'clock on the morning of the following day. The congratulations, the hand-shakings, the shoutings were finished for the time being. The three explorers had flung off their grimy, oil-soaked clothes, had had food, hot baths, and a long night's sleep in comfortable surroundings. Fanshawe felt that a great load was off his mind, but he was not yet fully at ease. He must still have it out with his brother. He was sitting in the main room of the hut, with the sleeping-bunks all round the sides. The place was apparently empty; the others were all employed on their various tasks in the open. 'The sooner the better,' he said to himself. He went to the door and called his brother in. The young fellow entered, his face white and anxious under the sunburn.

Fanshawe looked at him in silence. 'You know what I have to say to you?' he asked at last.

'No—I don't,' stammered the other. 'At least, I suppose it's——'

'I'll tell you, then,' said Fanshawe grimly. 'You stole food. You robbed us—Pardew and myself. I don't know how long you did it, but it was for days, perhaps weeks. I watched you, and saw you take it myself. And you're my brother! What have you to say?'

Arthur stared at him for a moment, with a working face, then turned aside. 'You know it all, then,' he muttered brokenly. 'Yes, it's true—I did it. What can I say—except that I'm not fit to breathe? I—I've tried to tell you for days past. I've wondered if you knew; and when you fell sick, I—well, I wished I could have died. I thought if I told you then it would about finish you.'

Fanshawe laughed bitterly. 'Fell sick!' he repeated. 'I feigned to be ill, to save the food, so that there would be enough to last out. You understand me? I did it to keep it from Pardew's knowledge, to keep your disgrace hidden.'

Arthur stared at him unbelievingly for a

moment, then dropped to a seat and covered his face with his hands. 'You did that,' he moaned. 'You did that for me—and I never guessed. Phil, Phil, I'm not fit to live; I'm not fit to lick your boots! Oh, what made me do it? What made me be such a brute beast?'

'I can't tell you that, my boy,' said Fanshawe gruffly.

'Why couldn't I be strong like you, Phil?' the other went on despairingly. 'Why couldn't I—— But what's the good of talking? I'm disgraced and done for; I know that. You'll never forgive me.'

'Look here,' said Fanshawe gravely; 'you are not disgraced. No one knows except myself. My scheme was successful. And as to forgiveness—you know I'll forgive you. Do you think I would have done all I've done if I couldn't forgive you?'

Arthur raised his head. 'You mean it?' he asked. 'You really mean it?'

'Yes,' said Fanshawe gently. 'It's all finished now, my boy. But there's one thing: you mustn't come out to the Antarctic again. You—you are hardly strong enough for it. You understand?'

'Yes,' said the other slowly. 'I understand. I—I don't know how to thank you, Phil—you're the finest man that ever breathed.'

'Don't talk rot,' said Fanshawe uneasily. 'Clear out now; I've got some writing to do.'

VIII.

Arthur left the hut without another word. Fanshawe watched him until the door closed upon him, and then sat down at the big table. 'He's had a lesson,' he said half-aloud. 'He'll run straight in future, I'm sure. After all, who am I to——' He stopped suddenly.

'The lad's last remark was about the truth, Fanshawe,' said a deep voice behind him. Fanshawe whipped round. He saw that Pardew had been lying hidden in one of the bunks, and was now leaning over the side with a smile on his face. 'It was about the truth, Fanshawe,' he repeated.

'You heard it all!' cried Fanshawe, aghast.

'Every single word,' replied Pardew in what was for him a cheerful voice.

The other clenched his fists. 'It's all over, then,' he cried despairingly. 'The lad's done for. The whole expedition will know it now.'

Pardew flung his legs over the side of the bunk and stretched himself elaborately. 'I knew all the time,' he said simply. 'Knew before you did—in fact, before you watched him that morning and found him out. I was wondering what I should do if you hadn't discovered it. Suppose I should have told you; that would have been my duty.'

'You knew all the time!' Fanshawe gasped. 'But—but what are you going to do now?'

'I'm going to keep my mouth shut, of course,' said Pardew in a surly tone. 'Think I'm such a cad as to spread the tale about?—and you saved my life in that beastly crevasse. Not much, Fanshawe.'

Fanshawe drew a deep breath. 'You mean it?' he asked almost fiercely. 'You will give me your word of honour?'

'Yes,' said the man of few words. 'Hang it all, Fanshawe, what do you take me for? I'm not *such* a cad, I tell you. By Jove! I never guessed you were starving yourself, though. If I'd known that, I'd have spoken to you at once. But I give you my word of honour to say nothing.'

Fanshawe looked at him and passed his hand over his forehead with a vague, bewildered gesture. 'I've been a fool,' he said slowly. 'I ask your pardon for misjudging you.'

'That's all right,' returned Pardew roughly. 'By the way, if you ever bring another expedition down here, I hope you'll think of me. It's an honour to serve under you.'

THE MONTH: SCIENCE AND ARTS.

SIMPLE DEEP-WELL PUMPS.

UNTIL recently almost all forms of pumps for deep wells involved the placing of piping down the well and the fixing of supports at the bottom, with others at intermediate points on the way up. Apart from the cost of the machinery, therefore, the fitting-up of the pipes was a considerable item. At the recent Shipping and Engineering Exhibition at Olympia, two makers were showing deep-well pumps which were suspended entirely from the surface, while their fixing did not entail even a descent into the well. In each case the pump consists of an endless chain or belt, suspended on a pulley at the top, and passing round a similar pulley immersed in the water at the bottom. The latter pulley, however, has no spindle or any connection with the sides of the well. The spindle of the pulley at the top of the well is caused to rotate at a comparatively high speed, with the result that one side of the chain or belt ascends rapidly, while the other side descends at an equal speed. The chains made by the two makers vary in form, one consisting of a series of horizontal spiral springs, connected together by pins; the other takes the form of a continuous vertical spiral of stout wire with another spiral (of which the wire is not so thick) inside it, and an ordinary chain inside

the inner spiral. In both cases the water is caught up in the chain and ascends to the top, where it is thrown off by centrifugal force as the chain passes round the top pulley. It is claimed by the makers of the horizontal spiral design that water or other liquid can be raised from any depth not exceeding 500 feet, and that the 12-inch chain, the largest made, will deliver 22,000 gallons, or approximately 100 tons, per hour. For the vertical continuous spiral type, depths up to 300 feet are practicable, while the largest size of chain delivers 2200 gallons an hour. Within their limits of working, these pumps can be made to deal with any quantity of liquid at any depth. In the smaller sizes they are easily worked by hand-power; but, of course, oil-engines or other forms of mechanical power are needed to work the larger pumps. An alternative to the chain pump is one using the well-known Balata machine belt, which, being composed largely of gutta-percha, runs satisfactorily in water. Upon this belt are mounted thin strips of zinc, so corrugated as to give a series of small V-shaped horizontal cells across the belt. At the exhibition a short length of belt could be handled by visitors; and when this was dipped into a tank of water and lifted, it was astonishing to observe how the water remained in the cells. This type of elevator will deal with quantities up to 50,000 gallons per hour, from depths up to 500 feet. The efficiency of these pumps is in the neighbourhood of 85 per cent., this being quite equal to, if it does not exceed, that of the best alternative pumps obtainable. Being so simple in design and construction, the pumps are sold at comparatively low prices.

A NEW FORM OF GEYSER.

That the familiar geyser for heating the bath water does its work uncommonly well few will deny; but those who have seen a similar contrivance recently placed on the market will realise that the ordinary form of geyser does not represent finality in design or construction. In the new device a single Bunsen-burner does the heating. The flame passes through the centre of a series of annular troughs. Each trough is made of thin metal, and its inner edge is extended into a number of fingers, projecting towards the centre. The Bunsen flame impinges upon these fingers, which transmit the heat to the trough. Water is admitted at the bottom, and is carried by means of a central pipe to the top. Thence it trickles through each trough in succession, and is ultimately collected into an outlet pipe leading from the lowest trough. The troughs are surrounded by a polished metal cylinder, which conserves the heat. An important feature of the apparatus is that both gas and water are turned on by rotating a circular handle. The heater is fitted with a pilot gas-jet, which may be left on continuously, or lit as required. On the handle being rotated, both gas and water are turned on full. Further movement decreases the quantity of water, and, therefore, raises the temperature at the outlet. Water can be heated up to 180 degrees F. The appliance is made in two sizes, one for lavatory basins and sinks, which supplies half-a-gallon of hot water per minute; the other for baths, which has a delivery capacity of two and a half gallons in a like period. Both are nickel-plated all over, and are adapted for being fixed to a wall without requiring a shelf to support them.

A NEW JOINT FOR PIPES.

Pipes are used for all kinds of purposes, and the lengths being limited by manufacturing and transport considerations, joints have to be made between the ends. In many cases the joints are subject to high pressures, and leakage is not uncommon; while the cost of the joints is considerable. A new type of pipe-joint is now available, however, which becomes tighter the higher the pressure. It is based upon the well-known U-shaped leather packing rings which are used in hydraulic rams. Hydraulic rams have to remain tight under pressures up to ten tons to the square inch, and yet allow the plunger to move in and out of its cylinder without undue friction. These requirements demand a very special kind of packing. This takes the form of a leather ring or washer of U-shaped section which is fitted in an annular recess in the cylinder, one side of the U being in contact with the plunger, while the other is confined by the side of the recess. When the pressure comes on, the water enters the U packing, and presses the side against the plunger with a pressure equal to that of the system. The pipe-joint which forms the subject of this note is really a development of the U washer. A broad ring, so constructed as to leave an enclosed cavity between itself and the circular surface which it surrounds, is fitted round the outside of the junction of every two pipes. The ring is lined by a leather washer which is U-shaped *at each end*, and appears in cross-section thus ⊂⊃. The unconnected legs of this double U are in close contact with the ends of the pipes, and the space between them, about a quarter of an inch, represents the space actually left between the ends of the pipes when the joint is placed in position. A somewhat flexible joint is thus created; and the higher the pressure inside the pipes, the more tightly are the unconnected legs of the double U pressed against the pipes, thus effectually preventing all leakage. This form of joint has several advantages, one being that the pipes need not be exactly in line, a movement of three degrees in any direction being allowable, which means that no great exactness is needed in preparing a bed for a pipe line; while ground subsidence does not

cause leaks. Again, the gaps between the ends of the pipes allow of expansion, and a length of pipe can be quickly removed or replaced. These joints are suitable for pipes carrying water, oil, compressed air, gas, steam, petrol, or any other fluid; and they may be applied to metal or concrete pipes. They will keep tight under pressures ranging up to ten tons per square inch. Where pipes have to be secured against being blown apart by the pressure inside them, a special split joint ring is used to hold the packing ring, this locking into a groove in the end of each pipe. Lastly, this form of pipe-joint is less costly than any other at present known.

NOVEL DEVICE FOR FORECASTING THE WEATHER.

It has long been known that from observation of a barometer in conjunction with the direction of the wind, the weather can be foretold with a considerable degree of accuracy. The chief difficulty is to remember what kinds of weather follow the various conditions. An ingenious instrument has lately made its advent, which, after pointers have been set to the conditions, predicts the type of weather likely to occur. It consists of three thin brass discs superimposed, one on top of another. Each of the two upper discs turns upon the one below it, and is smaller than the one upon which it turns. This reduction in diameter leaves margins on the lowest and second discs for figures and arrows, while the smallest disc is clear for directions. When a weather forecast is required, arrows on the margin of the middle disc, indicating whether the barometer is rising, falling, or steady, are set to the direction of the wind on a scale at the bottom of the biggest disc. This setting being held in position, the pointer of the smallest disc is set to the height of the barometer on a scale at the top of the instrument. The forecast then appears through a radial V-shaped slot. If two forecasts are visible, an average between the two should be taken. It should be noted, however, that in taking barometric readings allowance, where necessary, must be made for the height above sea-level. If the barometer used is not adjusted to give sea-level readings, one-tenth of an inch must be added for every ninety feet of height of the place of observation above sea-level. This forecasting instrument measures about four inches in diameter, and is supplied in a soft leather case. It can be used anywhere in the United Kingdom, and the percentage of correct results is said to be very high.

A LIQUID BLACK-LEAD.

As every housewife knows, there are two drawbacks to the use of ordinary black-lead: (1) the trouble of mixing it; (2) the dust inevitably produced in the process of polishing. Our lady readers will, therefore, be interested to learn that we have recently made a thorough trial of a liquid form of black-lead from which these drawbacks are completely eliminated. The test proved satisfactory in every respect. A small quantity of the liquid having been applied to a kitchen-range by means of a cloth, a brilliant and *lasting* polish was speedily obtained on the application of the brush, without the raising of a particle of dust.

SOMETHING NEW IN BOATS.

Probably the lightest and most easily propelled craft in the world is the Canadian canoe; but it possesses the disadvantage of being very readily capsized. In marked contrast to this type of boat is the Thames punt, which is heavy and sluggish, but very safe. Recently the safety of the punt and the lightness and ease of propulsion of the canoe have been combined in one boat, this having been rendered possible by a special form of construction. The boat referred to resembles a canoe with a flat bottom, which is in one piece, as is also each side. The material consists of two thicknesses of mahogany, so arranged that the grain of each lies across that of the other. These two thicknesses are cemented together with waterproof glue, and are further secured by rows of linen-thread stitching. The bottom is only five-sixteenths of an inch thick, while the sides are only quarter inch. The corner joints between the sides and the bottom are made by means of pieces of hard wood, which run from end to end of the boat, and are grooved, or 'rabbeted,' at each side to take the edges of the material, these being secured by brass screws. With this construction a leak is almost an impossibility. Two sizes of these boats have been standardised, one measuring 18 feet in length, and the other 22 feet. They are suitable for all sheltered waters, and are adapted for sailing, rowing, punting, or paddling; while a special form of detachable in-board motor is supplied when ordered. This motor is particularly interesting from the fact that it is the first attempt to provide a motor outfit inside the boat which can be taken out in one piece in a few minutes. The complete motor, with its tanks, pumps, silencer, stern-tube, and propeller, is carried on a special frame, which fits over a hole in the bottom at the stern, the joint being made tight by a special rubber ring. The only parts which are not self-contained are a control-plate and an emergency switch. These are fitted at any spot in the boat which may be found convenient, usually alongside the after-accommodation, this being similar to that in a Thames punt, the occupants sitting on cushions supported by backboards at each end of the boat. The propeller is reversed by means of a handle on the control-plate, which also carries the timing and throttle levers. All controls are transmitted by Bowden wires, and the plate is held by two thumb-screws. When the motor is being installed, therefore, all

that need be done is to tighten six screws which hold the motor-frame to the bottom of the boat, fix the control-plate, and screw up a joint for the exhaust-pipe, these operations being carried out easily in seven minutes. The motor develops 2¼ h.p., and it is fitted with a very effective silencer. Even with this small power the boats are driven at 7 and 6½ miles per hour for the 18-foot and 22-foot boats respectively. These boats can be made in two pieces, with a bulkhead at each side of the joint, so that each part can be used as a separate boat if desired. Moreover, at the gunwale they are fitted with massive gun-metal hinges, so that, after the bolts securing the two portions are undone, one part can be folded into the other. This is a very great advantage for travelling, as when folded one of these boats can be placed in a luggage-van, whereas if it were built in one piece a special truck would be required. An 18-foot boat was purchased by Sir Ernest Shackleton, and taken on board the *Quest* just before she sailed from Plymouth. The bottoms of the boats are fitted with rubbing pieces; the boat ordered for the *Quest* was further protected by metal strips, which will enable it to be run over the ice. In addition to the control-plates alongside the after-seat, a special form of wire transmission to the rudder is provided, this having a handle just above the control-plate, so that the boat can be handled entirely from this position once the engine has been started. The boats are varnished all over, and are given a very high degree of finish, the gloss approaching that achieved by coach-builders. All accessories are of the very best quality.

A TIME LOCK FOR PUSH-BIKES.

Enhanced values, a looser moral code, and unemployment have combined to render all portable articles of value more liable to be stolen than was the case a few years ago. Thefts of 'push-bikes' have always taken place to some extent, but they have greatly increased in number during the last year or two, with the result that several locking devices have been placed on the market. One of them was described recently in these notes; another, somewhat similar in character, has now made its appearance. By its aid the back-wheel is prevented from turning by a bar across the fork passing between the spokes. This bar hinges in what looks like a small round clock, having a minute-hand and an hour-hand, with the usual figures marked round the face. When the bicycle is in use the bar hangs downwards, and is rigidly held clear of the spokes. To lock it, the 'clock' hands are set to any predetermined position, this operation releasing the bar, which is then swung round between the spokes and is locked into a similar 'clock' on the other side of the fork. This 'clock' also must be set, although it has only one hand instead of two. Once in position, the bar is locked by turning the hands of the 'clock,' and it can only be unlocked by restoring the hands to the predetermined position. Finished in nickel and enamel, the device can be fixed to any machine in a few minutes.

A HANDY REPAIRING OUTFIT FOR MOTORISTS.

One drawback in connection with motoring is the necessity of changing tubes should a puncture be met with during the course of a journey, not to speak of the enforced lack of economy in carrying spare tubes, which are slowly deteriorating in value before even they are put into use. We have recently made successful trial of a repair outfit which obviates all need for changing the tube in the overwhelming majority of cases where a puncture is sustained. The outfit includes six round and six oblong patch units, and a clamp for holding the unit in position. A puncture having been met with, a suitable patch unit, which consists of a metal cartridge containing an accurately measured charge of non-flaming chemical fuel and a disc of rubber attached to the outside of the cartridge, is clamped over the puncture, and a lighted match is applied. After five minutes the cartridge may be removed, when the patch will be found adhering so closely to the tube that it cannot be removed without tearing, being vulcanised to it. The tube, it may be noted, is quite unharmed by the heat. For ordinary punctures the round unit is the better; for cuts and tears the oblong patch is the more suitable. The patches may also be used in mending overshoes, hot-water bottles, and other articles made of rubber. Great care should be taken to keep the patch units dry before they are used; this can most readily be done by enclosing the outfit in a tin box. A similar but larger outfit is also on the market for the repair of damages too large to be successfully undertaken with the help of the apparatus just described.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (*a*) a reply post-card, or (*b*) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE PARTNERS.

By PERCY JAMES BREBNER, Author of *The Gate of Temptation*, *A Gallant Lady*, *The Little Grey Shoe*, &c.

PART I.

I.

THE passing of the salt started conversation.

'Dropped in by chance?' inquired the man on the opposite side of the table, not in a casual tone, but as if he were interested in the answer.

'Quite by chance,' returned the other, who before entering had studied the price-list in the window to make sure he could run to a dinner even in this third-rate eating-house. 'I am amongst those who do not know where they may be to-morrow.'

'Like that, is it? Well, keep smiling. A smile has the same effect on ill-fortune as the sound of a trumpet had on the walls of Jericho.'

'You 're an optimist.'

'Yes, and my name is Watson. What 's yours?'

The other was unprepared for so direct a question, and did not answer.

'Shy of giving your name to a stranger, eh? I'm surprised. You don't look as if you had any reason to be shy.'

'I haven't,' was the quick answer. 'There 's no mark up against my name anywhere. It 's Graham—Richard Graham.'

'Gentleman,' Watson added. 'I know. Struck a bad patch. Started by being fastidious, discovered how few friends there really are in the world, and now that you 're up against it, and ready to take any kind of job, can't find one to take.'

'So true, you might have been following me about all day,' Graham returned. 'When a man like me gets on the rocks, it is assumed he has got there by doing something disgraceful.'

'I haven't asked any questions,' said Watson. 'I am always inclined to take a man at his face value.'

'And I don't happen to have come, cap in hand, asking you for a job.'

'Getting bristly won't cut any ice,' Watson returned. 'It happens that I'm looking for a man like you, a fellow who would drop into my life by chance. I was thinking of this chance chap, when in you walked and sat down opposite to me. Curious, wasn't it?'

Graham looked at his companion, judged him to be at least twenty-five years his senior, a man mentally strong, physically fit, hardened by a strenuous life lived in the wild places of the earth. He looked as if he ought to have done something with his life. He ought not to be in this third-rate eating-house.

'Size me up,' said Watson, after a pause. 'I've no certificate of character to pass over for your inspection, and don't make the mistake of thinking I 'm a philanthropist.'

'Why are you looking for a chance acquaintance?' Graham asked.

'I want a partner.'

'What for?'

'That comes to the point,' said Watson, 'and it can't be discussed here. I have a couple of rooms out Islington way. When you 've finished, we 'll get along there and talk it over.'

That talk lasted until the gray dawn of another day started to creep into Watson's shabby rooms. Graham began by watching his companion suspiciously, then believed he was a harmless lunatic, and ended by being convinced that he was a genius.

Watson was an inventor. Many of his contrivances, if they worked as he declared they would, must have money in them; but he was chiefly concerned with a mechanical device which, fitted to motor-engines, would give more power with about a fifth of the expenditure of petrol. He proved it by the working-model he had in his rooms. He was prepared to put up the necessary money, but he did not want to appear personally in the business. That is why he wanted a partner.

'There 's a fortune in it,' he said; 'but whatever we call the firm, Richard Graham must be the sole partner to the world, Watson merely a hand—well, he might be foreman in the works.'

'But why should——'

'I haven't asked you what you 've done with your life so far, so why ask me?' said Watson, showing some resentment. 'I haven't suggested anything dishonest, have I?'

'No.'

'Then leave it at that.'

'I was thinking of you more than myself,' Graham returned. 'I stand to win whatever

 [*All Rights Reserved.*]

happens, while you—what guarantee have you of my honesty?'

'This,' and Watson brought his hand from his hip-pocket with an automatic in it. 'I am content to take you at your face value; but if you let me down—well, it is my way to settle things off-hand. I don't like legal processes.'

'You threaten?'

'No. It is my method of making a contract. You want a job; I offer you a partnership on condition that I remain unknown. I ask no questions, nor do I answer any. The past is nothing to either of us. We are starting a new firm, which is going to stand or fall on its merits. If you can't trust your own honesty, clear out; if you can——'

'I can,' Graham answered. 'Put that threat back in your pocket, and shake hands on the bargain. I will do my part to make the firm a roaring success.'

'That's the kind of talk that appeals to me, Graham. The firm comes into being from this moment. Now I am tired, and must sleep. There's the sofa—get an hour or two's sleep yourself. We've both done and said enough for one working-day.'

Graham fell asleep almost at once, and his dreams were pleasant ones of wealth and prosperity.

II.

The firm of R. Graham & Co. began modestly enough with a small factory, a few hands, and somewhat makeshift office arrangements, but from the outset it started on the road to prosperity. It had an article of outstanding merit and utility to sell, besides several useful side-lines for which a demand was created. Watson, the foreman, was a genius, not only as an inventor, but in his ability to get hold of the right workmen; while Graham showed great business capacity, and found that the very people who would not help him when he was down were only too eager to know him now he was making good. Inclination often prompted him to reprisals, but for the good of the firm he renewed old acquaintanceships, and used them for all they were worth. He took a small bachelor flat in Westminster, and lived, not extravagantly, but as became a successful man, entertaining judiciously, and being entertained. Watson still lived in the two shabby rooms in Islington, making no show at all. He never visited Graham on terms of equality, and in the factory he was careful to preserve the attitude of master and trusted foreman; but as partners they sometimes met in the Islington rooms and discussed the firm's affairs.

'We are a perfect combination, Graham,' Watson declared on one of these occasions when it was decided to launch out further. 'I can deliver the goods, and you've got the business *flair* to make things hum. There's no such word as failure in our dictionary.'

'You're satisfied?' Graham asked.

'Quite. Aren't you?'

'There was a subtle meaning in my question, Watson. I was wondering whether you still thought it necessary to carry that automatic.'

Watson took it from his pocket.

'You do!' Graham exclaimed in surprise.

'It has become a habit. Haven't you any habits which other people might think idiotic?'

'Lots, probably.'

'Well, that's that,' said Watson, replacing the weapon. 'So we launch out, eh? Get offices away from the factory, take in the building next to us, and make double the profits?'

'That is how my figures work out.'

'And I can find no flaw in them, so go ahead,' cried Watson.

'By the way, I met one of the directors of Dixon's Limited the other night at dinner, Watson. I hadn't seen him before. He was rather curious about some of our patents; asked me whether they were not improvements on similar devices which had been tried some time ago and had failed.'

'And you told him to mind his own business, of course?'

'Not brutally like that,' laughed Graham. 'Dixon's are big buyers of our stuff, and I had to be tactful. Don't be alarmed; I didn't give my foreman away. Selby may think I have improved on some other man's ideas, but that is not going to do us any harm.'

'Selby! Is that his name?'

'Yes. He is a big man in his way, and has had a great deal to do with making Dixon's car the success it is. Fitted with our fuel-saver, it is fast becoming the most popular small car on the market.'

'So is Graham a big man in his way,' said Watson; 'and if Selby gets curious, he must have a rap over the knuckles. He sounds like the kind of man who would infringe a patent if he had the chance. If Dixon's tried that game, we'd smash them.'

He was quite fierce about it, and the circumstances hardly warranted the outburst. Graham put it down to the irritability natural to the temperament of an inventive genius, but at the same time it made him speculate afresh about his partner. Never by a single word had Watson let in any light upon his past, nor had he given any indication that his retired mode of life was irksome to him. There was no suggestion that he was afraid of anything in the past, but rather that the kind of life which, as a successful man, he might have entered had no charm for him. Graham's life would bore him stiff, he said on more than one occasion, and declared that his leanings were towards Socialism. He was very careful that all the work-people in the firm were well treated, was *persona grata* with them, and said the class to which they belonged was worth infinitely more than the class Graham

favoured. And then he would laugh and rejoice in the excellency of the partnership.

III.

R. Graham & Co. launched out with the greatest success, the business increased by leaps and bounds, and within two years of its inauguration the firm was again seeking increased factory-room. This phenomenal success made it imperative for Graham to relegate some of his work to others, and a confidential secretary became a necessity. He did not advertise; he mentioned his wants to one or two customers, with the result that a Miss Ada Roberts applied, backed by a letter of introduction from a partner in a motor firm. Her credentials were good, her appearance was attractive, but her chief recommendation to Graham was that she appeared to have had rather hard luck in life. Graham knew what that meant, and the girl was given the post.

She proved more than satisfactory. She had the knack of anticipating her employer's wants, relieved him of an immense amount of detail, was clever, self-reliant, and splendidly capable. Graham realised that he had found a treasure, and for a time that was all. Then he began to experience a certain sense of want when she was not in his room, which had nothing at all to do with business; he caught himself thinking of her out of business-hours, and desiring her companionship altogether apart from the office. He had begun by thinking she was pleasant-looking, neat, and business-like; now she had become exceedingly pretty and full of charm. He speculated how she would look if he met her out one night and she were allotted to him to take in to dinner. The office-dress was exactly as it should be, but in evening-dress—why, she would look positively beautiful.

Richard Graham was not of a susceptible nature—this gradual development in his appreciation of Ada Roberts proved it—but once his interest in her was aroused, he found some difficulty in keeping it within bounds. There were little attentions which she could hardly fail to notice, even if she did not realise their significance—attempts to save her trouble, little considerations which were quite unnecessary. Neither by word nor action did she give any sign that she noticed a change in her employer's behaviour, and it would have astonished her had she known how constantly he was turning over in his mind plans for meeting and knowing her away from the office.

She came into his room one morning with a sheaf of typewritten sheets for Graham to look over. He had arrived late, having been into the country on business.

'Oh, you have got those estimates done. That's good. I will glance through them, and they can go off to-night. Anything happen yesterday?'

She told him of various callers, gave him a short account of what she had done in each case, and appointments she had made for him.

'You will find them all noted in your diary,' she said.

'Capital!'

'Mr Watson, the foreman, is waiting to see you.'

'I will see him at once;' and then, suddenly conscious of a peculiar tone in her voice, he looked at her quickly. 'You speak as if you didn't like Watson.'

'I don't—much.'

'I assure you he is a splendid fellow, my—my right-hand.'

'And, of course, my likes and dislikes are of no importance,' she said. 'My work does not bring me much in contact with Mr Watson; if it did—well, it doesn't, so there is no more to be said.'

It occurred to Graham that he might forge a link between them by discussing the importance of her likes and dislikes, but before he could find words she went on: 'A man called yesterday who would not leave his name. He asked whether any one named Vallence was connected with the firm.'

'Vallence! I have never heard the name.'

'I told him I would ask you.'

'There may possibly be a hand of that name,' said Graham. 'I will ask Watson.'

Watson came in, very much the foreman, but he said nothing until Miss Roberts had left the room again.

'Is that the girl you said was a treasure?' he asked.

'Yes, that is Miss Roberts. Don't you like her?'

'She's good-looking, but that doesn't count for much. I'm afraid of good-looking women; they carry too many guns for most men. Why did you wire for me to come up here? You know I hate coming to the office. My place is with the workmen, not with the bosses.'

'We must discuss the business I have been engaged upon at once,' Graham said. 'I went down to Portsmouth yesterday and clinched it. Government contract, Watson, and it is going to take this firm to the top of the tree. Look at these drawings and specifications.'

'You could have brought them down to the factory,' Watson grumbled; but as he looked over the papers he forgot his annoyance and became keen on the work. 'By Jove! we are going to make a big thing out of this,' he went on, looking up; and then he went into arrangements, charges and profits, with a thoroughness which astonished his partner, used as he was to his mental capacity. So busy were they discussing various points, and the ways and means of coping with this enormous influx of work, that Graham forgot to ask whether there was a hand at the factory named Vallence.

(Continued on page 108.)

IMPERIALISM OR IGNORANCE?

BRITISH STRATEGY IN THE GREAT WAR.

By Major-General Sir GEORGE ASTON, K.C.B.

IT seems much more than three years since the allied and associated Powers won the war by defeating the main German army. We have almost forgotten the old controversies between those (commonly called Westerners) who held that no forces ought to be diverted from the main purpose unless they helped, directly or indirectly, in that purpose, and those who held other views. In the actual event we sent more than three soldiers to other parts of the world for every five we sent to France and Belgium, so we employed only five-eighths of our available military man-power in helping directly to bring about the defeat of the main German army.

It seems to me that we should be very foolish not to take account of the accusations of 'Imperialism' so freely made against us, in connection with the diversion to other purposes of the remaining three-eighths. Such accusations have been implied by many writers in other countries, allied, enemy, and neutral. To put it baldly, many of them believe that we undertook some, if not all, of the various enterprises in different parts of the world simply because we were greedy for territorial expansion. We can expect that sort of idea from men brought up in the military school of Prussia, such as Ludendorff, who analyses the actual effect upon the issue of the war of our various diversions of force from the main theatre, and comes to such conclusions as this: 'The English operations in Persia, Mesopotamia, and the Peninsula of Sinai (in 1916) were not directed to the destruction of the Turkish army, but aimed at territorial acquisitions for the British world-empire.' The reason why small German forces were diverted to this theatre may be gathered from the same authority: 'The stiffer the Turkish defence in Palestine and Mesopotamia, and the larger the force absorbed in the English effort to achieve their object, the more our burden in the West would be lightened,' and so on. This is Ludendorff's exposition of the German policy: 'To increase our Colonial possessions and advance our position in the world by extending our markets . . . could only be done by force.' It is natural that he, and a large majority of his fellow-countrymen, should believe that we went to war with similar objects in our minds; but what seems to me to be much more serious is that this estimate has been formed about us not only by our enemies, but by many of our friends. Not long ago, when the Syrian question was to the fore, outspoken articles appeared in the Paris press, stating that when we diverted strong forces, sorely needed in France, to the conquest of Palestine and Syria, we were working for our own expansion. It came as a pleasant surprise to many Frenchmen when we proved that we had no such ends in view in those regions. A similar plea was raised in Italy over the question of Italian claims in Dalmatia; great territorial acquisitions, we were told, fell to our share on account of the use to which we put the armies which we diverted to distant theatres. No doubt the same impression prevails in many neutral countries, perhaps even in parts of the British Empire. It is time that we took stock of the situation. We ought to have learned by this time that no nation can afford to ignore the opinion of the world, however clear may be the national or personal conscience.

In the strategy adopted by the United States in their war with Spain in 1898, a strong line can be drawn between the operations conducted to influence the issue of the war and those intended to influence the terms of peace. For instance, Cervera's fleet having once been destroyed, the issue of the war was no longer in doubt; then, and not until then, was a force sent to occupy the island of Porto Rico, presumably in order to influence the peace terms. Similarly Japan, in her war with China, first defeated the Chinese army and sank the fleet, and then occupied the Pescadores Islands. Her war with Russia, ten years afterwards, followed a similar course: first she sank the Port Arthur fleet in harbour, drove the Russian armies northward, and sank Rozhdestvensky's fleet at sea; then she occupied the island of Saghalien. We made diversions while the issue was still in doubt, and it is only natural that not only our enemies but our friends should ask the reason why we did so. What is the answer? It is important that the only people who know should explain; otherwise the moral backing of our representatives in international affairs will, to say the least of it, be inadequate. The data must by this time be at the disposal of the staff of the official war history, and I hope that, in the interests of the honour of the whole British Commonwealth of Nations, they will soon bring out a short explanation of our strategy. We have a certain amount of data to solve the problem for ourselves.

We can set aside the diversion to help Italy on what we can look upon as a prolongation of the Franco-British front, and no one could accuse us of working for our own ends in the Dardanelles venture or at Salonika; but the question should be answered about the operations

in Mesopotamia, Palestine, and German East Africa. Lord Haldane's book, *Before the War*, is the most authoritative statement so far published about our war strategy. I have sought therein for information about the principles that guided us in the military situation with which we had to deal. The situation which actually arose had obviously not been studied or foreseen. We worked out, in detail, a scheme for sending the British expeditionary force to France in certain eventualities, but we made no plans for using any military forces elsewhere. The Committee of Imperial Defence, the body advising the Cabinet on war preparations and on war strategy, evidently contemplated a short war, in which the whole overseas field army of the United Kingdom (six divisions and a cavalry division) would be required on the Western front. There would be no troops available for other purposes. The use of troops from India or from the self-governing dominions was either not contemplated or their availability was too doubtful for it to be worth while to draw up detailed plans for their employment. Such, it appears, was our military strategical plan for a war against Germany and Austria. It contained no provisions whatever for territorial aggrandisement.

Our naval plan was equally simple. We had to secure the passage of our army to France, and we had to maintain all over the world the sea communications upon which the endurance of the Empire and the existence of the population of the United Kingdom must always depend. For this purpose we had to do our best to destroy all German war-vessels; failing that, to prevent their serious interference with our sea traffic. In former years our policy had been to shadow prospectively-hostile war-vessels all over the world whenever a critical situation arose. At the outbreak of war in 1914 Von Spee's formidable squadron in the Pacific was unlocated. Furthermore, while we had been talking about an 'Imperial chain' of long-range wireless-telegraphy stations, the Germans had made one. Information being more than half the battle in the effective employment of sea forces, the possession by Germany of these high-power stations more than doubled the menace to our sea communications of her unlocated war-vessels, especially of Von Spee's fast armoured cruisers. The Australian navy's flagship *Australia* was the only vessel in local waters capable of coping with such craft. With these points in our minds, it is easy to grasp the reasons for our diversion of small military forces to take or to destroy the wireless stations and harbours under the German flag in Togoland, the Cameroons, South-West Africa, and the Pacific. It was obviously a defensive measure, with no ulterior object in view. History provides abundant precedents for such operations in sea warfare. The military forces employed for the purpose were inconsiderable (less than one-sixtieth of our army effort on the Western front), and a large proportion of them were unsuitable for employment in Europe for the main operation, the defeat of the German army.

Other German vessels (the armoured cruiser *Goeben* and the smaller *Breslau*) were at large in the Mediterranean. Their escape up the Dardanelles is a matter of history. That escape, leading as it did to the hostility of Turkey, brought about a complete change in the strategical problems of the war, as seen from the point of view of the British Empire. As the greatest Moslem Power in the world, we were vitally affected by the attitude of Turkey. The idea of the strategists of the German Great General Staff was to induce us to use against Turkey large forces which we should otherwise have been able to use against the German army in France and Flanders. There was an urgent need on our part for 'clear thinking' and for 'empire thinking.' The advisory body charged with thinking out such matters (the Committee of Imperial Defence) did not assemble during the war. Its members were working night and day at the actual conduct of the war, and its staff had been transferred to the War Council, a small executive body, to which the large Cabinet transferred its normal responsibility for all war measures. There was no body with time to think, clearly or otherwise, about the changed aspect of war problems brought about by new alliances, unforeseen in pre-war days, and therefore not provided against. The obvious points were that Turkey was in a position to threaten the Suez Canal, our interests in Egypt, and the supply of oil-fuel for our navy from south-west Persia. These interests had to be guarded, and it was a question whether greater diversions of force would be required to guard them by defensive action, awaiting Turco-German attacks, or by a counter-stroke against Turkey.

Our first plans were defensive, to hold the Suez Canal, and to advance a short distance into Mesopotamia to keep any Turkish forces away from the oil-fields in south-west Persia. We had not enough trained men available for a great counter-stroke. So far there can be no question of a desire on our part for territorial acquisitions. Our vital interests were threatened, and the strategical problem was how best to defeat, destroy, or otherwise render harmless the Turco-German army and the Turco-German warships which threatened these interests. We had no consultative body, as I have shown, to work out the problem, to form comprehensive plans, and to estimate in detail the resources required for their execution. Without such estimates before them, those who were charged with policy could hardly be expected to form correct conclusions or to give sound decisions. I do not propose to go into the question whether a combined naval and military (and nowadays

air) staff on a permanent footing, or a staff called together *ad hoc* to deal with special situations, would be the best body for the purpose, but will confine myself to what occurred. The Turks developed an attack upon the Suez Canal, reaching their objective at the end of January 1915. In Mesopotamia they had lost Basra in November 1914.

On 13th January 1915 the War Council, the executive body to whom the Cabinet had deputed the strategical conduct of the war, ordered the Admiralty to prepare to *take* (without the aid of troops) the Gallipoli peninsula, which contained a Turkish army of unknown strength. We can assume that the impossibility of the task laid upon the navy (to take a peninsula containing a strong army) would soon have been apparent if, before the order had been issued, a competent staff had first been directed to examine the proposal. Without raking up old controversies about the Dardanelles tragedy, we can see clearly the far-reaching effect upon our war strategy of the decision by the War Council to *take* the Gallipoli peninsula without an army, but there was no question of territorial aggrandisement. Having failed with naval forces, the members of the War Council adhered, rightly or wrongly, to their determination to take the peninsula, and a force representing about one-eleventh of the army effort which we employed on the Western front was expended fruitlessly in the endeavour to attain that object. Our failure greatly increased the threat to British interests of the hostility of Turkey; Bulgaria had joined our enemies; the fall of Kut-el-Amara and the capture of General Townshend's army in Mesopotamia in the following year (April 1916) struck a further blow against our prestige in the eyes of all Eastern peoples.

We have not as yet been given enough information to enable us to understand the strategical purpose of the subsequent operations in Mesopotamia and Palestine. They absorbed the bulk of our army man-power sent to destinations other than the Western front. It is about these operations that an explanation should be furnished to critics abroad, who attribute them to our greed for territorial expansion. They resulted in the Turkish surrender at the end of October 1918, a timely blow to German power and ambitions in the East at a moment when the whole Pan-German edifice was tottering on its foundations. Critics have advanced, possibly with some truth, the plea that the same result would have been produced much earlier by using in France the bulk of the forces we used in the East. Others reply that a large proportion of the troops employed there were not suited for the climate of France and Flanders, and that, after the Dardanelles failure, it was clear that we should have to deal with Turkey sooner or later, or endanger our security and influence in the East. Whatever course we *should have* adopted, it is clear that the strategy which we *did* adopt led to operations initiated without calculating the resources required to ensure a speedy successful issue. There was no question of territorial expansion at the time, and, as long as our vital communications with India were secured, I do not believe that the British people cared who got 'mandates' for supervising the people whom we liberated from the Turkish yoke, provided it was not a nation which proved its hostility to us in the war, or was likely to be hostile in the future.

In the operations so far dealt with we employed, altogether, more than half as many men as we sent to France and Flanders during the war. There remain, to put the different theatres in order of military man-power, Macedonia, German East Africa, and Italy. Ludendorff would doubtless claim that the attack by the Central Powers on Serbia in 1915 was, at the time, a German strategical success which drew to Macedonia, too late to help Serbia, a considerable British and Allied army otherwise available for use against the German army on the Western front. The Salonika enterprise seems to have been entered upon, on French initiative, for political, rather than for strategical, reasons. There can have been no question of advantage or of extension of British territory in that area. The Allied force in Macedonia, with a secure base at Salonika, had much to do with the surrender in September 1918 of Bulgaria, the first of Germany's Allies to break away from her bondage.

Of the diversion of force to German East Africa there is little to write. There again we find a high-power wireless station, and harbours of use to German war-vessels. The Germans first invaded British East African territory. Our first counter-stroke, the Tanga landing for capture of Dar-es-Salaam, was a failure. The decision to strike with a large army was arrived at towards the close of 1915. We have not been told the strategical object we had in view, but it seems to have been to secure our position in Africa against the menace of native East African troops, trained and led by Germans. As with Mesopotamia and Palestine, little information has been published about the way in which the East African campaign fitted into our general strategical plans. In man-power, the operations in that theatre represented about a fourteenth of our effort on the Western front, and it is impossible to judge whether, if we had not undertaken them, a greater effort would have been required to defend ourselves in Africa against German attacks and intrigue. In these theatres, as in Mesopotamia and Palestine, only a small proportion of the man-power employed was available for use against the German armies in France. Here, as elsewhere, there is no evidence of any desire on our part for territorial expansion, but, after our late experience, there

is no doubt that we should be sorry to see German rule re-established either in the east or in any other part of Africa. Our obligations to the natives lend additional force to that attitude.

Of the diversions of military force from our main task in France and Flanders, there remain only the force sent to help Italy after Caporetto (October 1917), and the forces sent originally to Russia to counter the German measures to use the territory and resources of that country to prosecute the war against us. In neither of those areas can any plea of a desire for territory be advanced. These diversions account for the balance of our army man-power sent to theatres of war other than the Western front.

I have made an appeal to the official historians to bring out, as soon as possible, an exposition of our war strategy as an antidote to the poison of hostile propaganda. I recognise that strategy is not a subject that appeals to the public taste. There is a tendency to be content with a victory resulting from the moral impetus which placed smashingly superior man-power and financial and economic resources at the disposal of the victors; but we must be prepared to meet the arguments of experts who remind us that strategical diversions of force 'have so important a bearing on the success of a campaign that the duty of determining their strength and the proper occasions for them is one of the greatest and most delicate responsibilities placed upon a commander' (Jomini). The usual idea is to use such diversions to prevent an enemy from concentrating his forces, or, if concentrated, to cause him to scatter them. The task that lies before our historians is to demonstrate, on these lines, the basis of the strategy which we adopted. Criticism of individuals, committees, or councils is to be deprecated. Few wars have ever been conducted in accordance with the principles of military strategy. 'Popular clamour and ignorance of the principles of strategy on the part of a Government have often forced commanders to detach, much against their judgment' (Hamley). Where such principles have been departed from, it lies with the responsible authorities to demonstrate the reasons for such departure. No one conversant with the facts believes for one moment that diversions of British Empire forces were made to influence 'imperialistically' the terms of peace; we know that their originators honestly believed that they would help to win the war. It may be that the study of military history and the warnings it contains had been neglected. If such should be the conclusions arrived at by competent and unbiased historians, it would be far better in these days to confess to ignorance than to the 'imperialism' of which we are being so generally accused.

MAN'S WORK.

By Alan Sullivan,
Author of *The Passing of Oulibut*, *Blantyre-Alien*, *The Inner Door*, &c.

CHAPTER IV.

I.

A MONTH later Sitwell, in his office, opened an important-looking letter, and examined the envelope to make sure that no cheque was enclosed. Then, casually, he began to read. All at once he straightened up, his eyes brightened, and his face became tense with interest. Presently he folded the letter carefully and put it in his pocket-book. The rest of his mail took but a few minutes, and shortly afterwards he re-entered his apartment with a step that was even lighter and quicker than usual.

Claudia greeted him with surprise. She was all in black, and her dress seemed to impose a pallor on cheeks that were usually full of colour.

'What is it, Bertie; anything wrong?'

He laughed. 'It's just the other way. This is the sort of thing I've been waiting for. Read it.' He handed her the letter.

She noted that the postmark was that of a small town in Illinois, and the writing that of a woman. Then she read:

'Mr H. Sitwell,
The Enterprise Oil Company,
Los Angeles.

'Dear Sir,—I have seen your advertisement, and if it is not too late, I would like to invest in your stock about twenty thousand dollars. This is my daughter's inheritance, and I must not lose it. So, before buying the stock, my daughter and I think of coming out to Los Angeles at once, and you will be able to show us the company's property, and answer more questions than I can put in a letter. Will you, please, telegraph me whether you will be there and meet us on our arrival, and show us the property? Then we can decide at once.

'Margaret Winter.'

Claudia stared at her husband. Something in his manner, even in the way he stood, had given her a subtle sense of alarm and discomfort. Only the night before they had had a talk, the result of which was to keep her awake for hours, putting to herself questions that she could not answer.

'This isn't my affair, Bertie,' she said slowly.

He smiled. 'I want to talk to you. This is a case for a little team-work. If we can pull this thing off, it means enough money for the first well. If we don't, that well won't be put down. Money has about stopped coming in—whether on account of something in the advertisement or not I don't know. Apart from Enterprise money, my own account is down to about two thousand dollars.'

'What!' she stammered, appalled.

He nodded. 'We've been under heavy expense lately that couldn't be avoided—your father's funeral, your clothes, and certain liabilities of his that'—he hesitated a little—you didn't know anything about. Financially, we're on the ragged edge of nothing. It isn't a pleasant thing to say, but it's true. I've been putting it off from day to day, waiting for something like this to turn up.'

'But this would be the company's money, wouldn't it? I don't understand.'

'Certainly; but with this, plus the rest, we could start work, and I could charge a comfortable salary for looking after it—something sufficient to keep us going.'

Claudia's face was grave. 'I didn't know things were so bad, but'—she faltered, glancing at the letter—'this frightens me.'

'Is it the amount?' he asked, smiling again.

'Partly—and the circumstances. This woman is a widow, and the money goes to her daughter.'

Sitwell's mood changed suddenly. 'What a beautiful doubter you are!' he laughed, slipping his arm round her. 'You've been congratulating me when subscriptions were five hundred dollars a day—and now you're rattled when one comes along for forty times as much. Tell you what we'll do; make Mrs Winter a director, and she can look after her own money.'

'But she doesn't know anything about the business?'

'I'll be there to help her,' said Sitwell evenly. 'Leave it at that. Now we come to your part of it.'

She stared at him wonderingly, still breathless at the sudden revelation of his financial insecurity. 'My part of it?'

He nodded. 'There are about one hundred oil companies within twenty miles from here that would give Mrs Winter a hearty welcome if they knew anything about this'—he tapped the letter. 'That's what we've got to avoid. I'm going to telegraph her to come along. Then, when they arrive, we both meet them, and you will insist that they stay with us till the matter is settled. That's the sort of thing that goes a long way.'

'Bertie, I can't do it!' she expostulated.

'Why?' he demanded shortly. 'Because you're in mourning?'

'Only partly. I don't know those people, and—and it's unnatural.'

Her husband surveyed her with amused tolerance.

'Look here, Claudia, I'll tell you something more. The trouble with most women is that they take the proceeds of their husband's work without knowing or caring what that work involves. Here's a case in point. You don't raise any objection to my way of doing things till there comes along something so big that it startles you. There's a chance like this about once in a life-time. I know that your father wanted me to get out of this business, on your account. He said so six weeks before he died. He never was really fond of it himself, but got anchored in it, and found he couldn't move. I'm a good deal younger than he was, and I'm not anchored—and I am willing to get out if the chance comes; and this is the best that's ever likely to come. Is this news to you?'

She did not answer at once, her mind being full of perplexity. She recognised her father's desire. It was true that in the past she had accepted much, and not troubled herself where it came from. All that her husband said appealed to the longing she had lately acquired to be rid of this method of life, which was going more and more against the grain of her nature. Unconsciously her mind turned to Shanklin. How foreign it would have been to him to put her in any such position! But—and she clutched at the thought with desperate relief—perhaps this was the path by which she could lead Sitwell to some safer and saner method of life. She glanced at him as though appraising his sincerity, and almost his loyalty.

'If we don't get this money,' he said, without a shadow of expression on his face, 'it probably means that we have to return all the other subscriptions. And that'—he made a significant gesture—'you ought to know what that means. The first well will cost about fifty thousand. Now how about a little team-work on your part? A pretty and attractive woman can help her husband a lot—by just being herself, if she wants to.'

Team-work, the expense of her father's funeral, her own clothing, the chance of something better and happier in the future! She balanced them up against the unknown widow in Illinois. It flashed upon her that Shanklin had condemned her father, and lost both herself and his position because he undertook to pass judgment. Now the situation cropped up again, and her own attitude seemed fantastically unreasonable. 'I'll do all I can, Bertie,' she said gently. 'When do you expect them?'

His face lighted up, and he drew her close. 'That's the right spirit, and between us we're going to pull this thing off.'

The decision once made, she felt somehow happier, and more confident. It would give her an opportunity in her own domain. Planning

entertainment for her unknown visitors, she took a sharp pleasure in the fact that the country round about was beautiful and full of interest, and she was proud of California in a new and exciting way. She contemplated visits to Catalina, to the Hollywood Studios, to the Sierra Madre range, piqued all the time with guesses at the personality of the Winters. She wondered what Illinois country-folk were like, and whether they would yield to the golden allurement of this land of sunshine. In the meantime her husband seemed to take on attributes less precise and more lovable, as though he, too, perceived the promise of brighter days.

II.

A week later the Winters descended from the California Limited, and Claudia, waiting at the barrier, breathed a sigh of relief. Mrs Winter was tall, good-natured-looking, with high colour and a large mouth. Her daughter struck Claudia at once as being a most attractive girl, with a tan dress, neat tan shoes, a workman-like hat, a small, well-shaped face, and eyes of the clearest gray. Her mouth was firm and delicate. Even Sitwell seemed pleased as he slipped forward and introduced himself, then Claudia. Mrs Winter regarded them both with a frank and interested stare.

'I 'm sure it 's very good of you to meet us. This is my daughter Edith. We 've been three days in that train, and I think we 'll go right to the hotel, if you got those rooms.'

Claudia captured the gray eyes. 'My husband and I hope you will come to us first—for a while. The good hotels have been full all winter, and you wouldn't like the others. We 're all ready for you, so do come.' She gave a little laugh and nodded. 'About the only comfortable place you can get in Los Angeles to-day is in our apartment.'

Mrs Winter shook her head a little incredulously. 'We can't impose on you—we 'll find something.'

Sitwell laughed. 'It 's more than we can do, and we live here. Most of the east seems to have moved west for the winter months this year. You might get a suite at the "Leamington" at fifty dollars a day.'

Mrs Winter gasped, and from Claudia to the girl sped a swift signal, unseen by the others, but very potent. Edith laid a gloved hand on her mother's arm.

'It isn't fair to Mr Sitwell, but I think we 're very fortunate to have found friends so soon.' She glanced at Claudia's mourning. 'Should we really come? Is it quite convenient to you?'

'My wife's father died five weeks ago, and she 's lonely,' put in Sitwell quickly. 'We live very quietly, and, of course, don't entertain, but I know she 'd be grateful if you came.'

'Truly?' asked Edith Winter with a quick, searching glance.

'Yes, truly.' Claudia made a little gesture of confirmation. This was the kind of girl she wanted to know, and make a friend of.

Mrs Winter breathed a sigh of relief. 'Then thanks ever so much, just for a day or two, till we get settled down. How do we reach your place?'

Sitwell smiled and led the way to his car. He had hung on to it in spite of pressing need. The man without a car in Los Angeles was a curiosity. As he drove he talked, and Mrs Winter listened with a touch of excitement.

'Better have a good rest first. After that we 'll run out and see a lot of producing wells near our property, then the property itself. There is plenty of time, and I advise you to do the thing carefully. I 'm quite at your service, and I think it will interest you.'

'Any oil near here?' she asked.

He changed his route and drove past bungalows and cottages, in whose back-yards were pumping-wells.

'There 's nothing quite like it in the world,' he said.

She nodded, impressed with the sight of those private treasure-houses, operating day and night just outside the kitchen window. They gave her a sense of possessorship. In Illinois she grew celery and beets in the garden. Here they pumped oil. She was taken, as well, with Sitwell's personality. He was not the type she had expected to meet, but rather a person of the world with admirable manners and address.

'We thought it best to come and have a look at the property ourselves,' she said thoughtfully. 'It was my daughter's idea, and it 's all a secret. I wouldn't let her tell any one—even her fiancé.'

'Good idea. I 've been thinking over the matter of your investment, and how it could be made as satisfactory to you as possible.'

'I haven't invested yet,' she said cheerfully.

Sitwell coloured a little. 'Certainly not; but in case you did, it has been suggested that you take a seat on the board of the company.'

'What! Me a director!' Mrs Winter was suddenly breathless.

'Why not?'

'I hadn't thought of that. I 'll put it to Edith.'

(*Continued on page 99.*)

FROM CHECHACO TO SOUR-DOUGH.

By Percy Dent.

UNTIL a man has lived long enough in the Yukon Valley to see the ice come and go he is a 'Chechaco'* (che-chaw-ker), after which he is a 'Sour-dough.' Such is the unwritten, but indisputable, law of the frozen north. In California, because incipient prospectors suffered much from the heat of the burning deserts over which they travelled, veteran miners dubbed them 'Tenderfeet,' thereby expressing their own physical superiority over those whose blistered feet caused them to lag behind in the mad race for wealth. In British Columbia, because the ardent aspirants for mining knowledge were such monuments of verdancy, past-masters in the art applied to them unaltered the well-known vulgarism, 'Greenhorn.' But in the Klondike regions existing conditions were found to be so different from those of any other mining-camp of the world, and new arrivals persisted in making such excruciatingly funny mistakes, that the old terms were wholly inadequate to describe them. Therefore those who had already passed through the mill of experience selected the Indian word 'Chechaco'—signifying extreme youthfulness in matters not particularly relating to age—as the fit and proper appellation for all the uninitiated; assuming themselves the title 'Sour-dough,' because nothing but that article can be depended on to leaven bread in a country where the grip of winter is so strong.

A 'Chechaco' who has determined to become a 'Sour-dough' watches with interest the endless string of ice-floes drifting down the mighty stream in the fall. It is thrilling. Men in flimsy Peterboro' canoes endeavour to warp clumsy freight-scows ashore. They force their way among the floating masses of ice with impunity, sometimes having to jump nimbly on to a flow and pull the canoe up after them in order to avoid being crushed. Jams are frequent, and woe betide those who are unprepared! There is a rasping, tearing sound, like a gigantic egg-shell cracking; a sharp cry for help that cannot be rendered; the river flows placidly onwards as before, but men and boat are missing.

By-and-by each little bay is frozen solid; the river itself becomes a flexible moving mass of piled-up ice. The big white thing heaves lazily as it passes by, anon lumbering against the ice-ledge, or receding, exposing a black streak of swirling water. Jack Frost exerts himself still more. The channel becomes too small for the sinuous monster crawling along so slowly, and a battle royal ensues between ice and banks. Far out on the snowy sheet black spots mark the places where helpless men are clinging to bits of wreckage. They fire signals of distress as they are being carried by, but none can aid; they must stay there till the pageant ceases or grim death relieves their terrible sufferings. The heavy grinding roar goes on continuously, an incalculable weight heaving against the immovable rocks until at last it shivers, and with a noise like the screeching of innumerable ungreased cart-wheels, slowly, very slowly, it comes to a standstill. The vanquished Yukon settles down for her long winter's slumber. Willing hands level the ragged surface with axes. A trail is quickly made, and swift-travelling dog-teams carry relief to all the unfortunates who have survived the fearful ordeal of being frozen in while the ice comes.

The Chechaco has learned his first lesson; he patiently awaits the last. He enjoys the novelty of seeing morning stars shining in the firmament at 11 A.M., and the evening stars twinkling brightly at 2 P.M. He is astonished to discover that the long Arctic nights are but little darker than a dull day; that he can travel long distances in that invigorating atmosphere and not feel fatigued. One morning he wakes to find the little thermometer hanging outside his cabin door registers between sixty and seventy degrees below zero, Fahr., and that the water he throws out recoils from the ground it touches with loud snaps, immediately becoming flakes of ice. He notices that the air now seems to oppose progress, till he fancies he is walking through thin water. His respiration makes a fretting noise. His eyebrows are covered with hoar-frost, his moustache with icicles, and he has frequently to 'sweat' the ice off his eyelashes to prevent them from freezing together. When he removes his thick mitts, the skin of his hands cracks open with little audible snicks. As he labours along the cold cuts his throat, yet he is conscious of a bubbling exultation within him—he is supremely happy at something. What, he knows not.

Just before midday the sun rises, and he is not surprised to see three orbs instead of one. It seems quite natural to see 'sun-dogs' in that enchanted land. They rest upon rainbow pillars, across which flit small glistening atoms like sun-lit mica. He gazes enthralled at the beauteous phenomenon, but is thankful when it disappears, for it makes his eyes ache. One night, as he lounges upon his rude couch, he becomes conscious that something unusual is happening. He goes outside, and fancies he is greeted by a

* The terms 'Chechaco' and 'Sour-dough' have been familiarised to English ears by R. W. Service's books, *Ballads of a Cheechako* and *Songs of a Sour-dough*.

seething, roaring sound. It fills the universe; yet, when he tries to define it, nothing exists. A soft glow lights up the country. Across the sky from east to west a filmy curtain is hung, swayed by invisible hands, incandescent, iridescent, and ever changing—a thrilling limelight effect on an infinitely grand scale. It is the Aurora Borealis. He heaves a great sigh when it vanishes, and re-enters the hut. His fingers were bitten by the frost while he watched, but he knew it not.

When the days lengthen out, he watches the snow depart from the hills with wonder. It slips away with alarming rapidity, and the little creeks foam and grumble because the freshet is heavy.

Rumour reports that the river is breaking up, and he hastens thither to complete his education.

The Yukon begins breaking up at its source. The warmer water of the melting snow pours into it through innumerable channels, dissolving and wearing off the under side of the thick ice. Presently the swelling body of water can no longer be confined beneath its icy trammels; the ice is rent asunder and heaved up. It is carried down-stream until a sharp bend is reached, where it packs, forming often a dam some thirty feet in height, flooding incidentally the surrounding country. The ice below the dam is soon broken up by the weight of water falling on it, but the pack remains intact, a colossal berg embedded deeply in the channel-bottom. It is often several hundred feet thick, and stretches from shore to shore, forming a miniature Niagara.

At last the jam breaks, and the huge floes go dancing down the swirling torrent in elephantine gambols, anon uprearing themselves high in the air, sometimes leaping quite clear of the water. Trees lining the shore are broken off and torn into matchwood, and the earth quakes in the mighty uproar. No man can hear another's voice in the thunderous din; yet above all rings the bell-like note of the floes as they collide, sounding like the musical clink of a wine-glass. A few minutes later the great stream has resumed its peaceful appearance of last summer. Tiny wavelets sparkle in the sunshine, eddies whirl round in their accustomed places, and none could guess that but a short time before it was the scene of a grand natural convulsion.

The Chechaco turns away with heart too full for words. He has won the proud distinction of 'Sour-dough.'

THE SNAIL AND ITS SHELL.

By G. W. Bulman, M.A., B.Sc.

HOW does a snail make its shell? The fool in *King Lear* asks the question as regards the oyster, but we may transfer it to our humble friend—or enemy—of the garden. How does it make its shell? The answer of science justifies the word 'make'; the snail does *make* its shell. For the shell, it appears, does not *grow*, like nails or hoof, but is actually *made*, or *built*, by the animal inside. In the wonderful chemistry of the snail's body, lime is separated from the food, and using its 'mantle' as a sort of trowel, the little mason spreads the mortar on the edge of the aperture—the lip, as it is called—of the shell. Very often in a specimen you can distinguish the new layer of shell from the old. And the new material is laid on so as to preserve the plan of the shell of the species to which it belongs—in our case that of the garden snail (*Helix aspersa*)—and no other. That is perhaps the most wonderful thing about it. There are so many thousand species of shell, and each snail builds its house after the special plan of its kind.

An interesting experiment was once tried by some ingenious Frenchmen. They carefully removed snails of a certain species out of their shells, and put them into the shells of other species. When these had occasion to enlarge their new abodes, they did it on the lines of their old shells.

Most wonderful of all, perhaps, are those cases where the builders *vary* the form of their shell according to their surroundings. We take the facts from that authoritative work, the *Cambridge Natural History*. There are certain species of clam which when attached to a smooth surface have smooth shells, but if attached to an uneven surface, such as coral, have very irregular shells. In fact, we are told that 'the sculpture of the base on which they rest is often reproduced in these attached shells.' So the oysters of the mangrove-swamps are found to vary their shells according as they are fixed to the branches or to the smooth trunks of the trees. In the former case the shell has a central convex rib from which the plaits of sculpture radiate, while in the latter this rib is wanting.

The case of a species which lives attached to another shell is perhaps even more remarkable, for it varies the sculpture of its shell according to that of its host. If it lives on a smooth shell it makes a smooth shell for itself, if on a ribbed shell it makes ribs on its own. One such which had 'ribbed' its shell because it lived on a scallop was taken by a naturalist for a new species. And there is in the British Museum a specimen of the shell known as *Hinnites*, which had apparently reproduced the copy of a little coiled Serpula on one of its valves.

Such, at least, is the accepted interpretation of the interesting specimen.

The shell-builder sometimes gets rid of the top storey of its house. At any rate snails are often found without the top whorls, and some have been actually seen banging them against some hard object as if to knock them off.

And then there are others which are not content with the ordinary shells which they have thus made for themselves. So they collect, and glue to them, bits of stone, shells, &c. Sometimes they make the selection of material with great care. One which was obtained on the *Challenger* expedition had ornamented its lower part with long pointed *shells*.

Sometimes, when the house of a periwinkle or a whelk is 'to let,' it is taken by a hermit-crab. If you look carefully at the heap of periwinkles in the fish-shop, you may see a bit of the little hermit-crab protruding from one or two of them. When the house gets too small the crab must quit, and go in search of a larger. This is for the crab a dangerous operation, on account of its soft body. So there is one species which, as it were, sends for a mason to come and enlarge the house for it. At any rate the mason comes in the form of an encrusting sponge, and settles down on the house. There it grows, and presently covers the whole shell. But it always leaves the aperture open, and as it grows it continues the proper coil of the shell. Thus a body whorl of sponge is added on to the shell. So, when the hermit has grown too big for the shell proper, it has only to move down to the larger whorl of sponge. Perhaps it is the crab itself which sees to it that the aperture is kept open, and of the right shape. Perhaps it trims the growing sponge as a gardener trims his box-tree.

The problem of the snail and the slug is ever with the gardener as a practical matter. And in theory it is not without interest. Here in the same few square yards of garden, living under very similar conditions, we have them both: the one 'protected' by a strong shell, the other defenceless—yet both flourishing exceedingly. Does the snail succeed in the struggle for life on account of its shell, and the slug continue to exist in spite of the want of it? Or is the absence of the shell an advantage to the slug, and the possession of one a handicap to the snail? Who can answer? Yet it may not be without interest to speculate a little on the matter. If we look at the snail alone we say readily enough, 'Yes, of course the hard shell must protect the soft body. It must be a great advantage.' Euclid's axioms are scarcely more obvious. But there, a few yards off, is the slug!

Natural selection, having, as it were, taken great pains to show us what a very useful thing, what a necessary thing, a strong shell is for a soft animal, says in effect, 'Not at all!' and points to the slug, which has, so to speak, thrown aside its shell as useless. And yet it keeps inside the folds of its mantle a minute model to show—perhaps!—that its ancestors were snails.

And to-day, both in the sea and on land, there are numerous species of such soft-bodied animals with no shells. Their very existence forbids us to put a sufficient premium on the shell to account for its evolution by natural selection. Out of the way, then, you sluggish one, emblem of all that is slow and tiresome! Must we needs drag *you* with us in our attempts to evolve the shell? Why have *you* not a respectable shell to protect you? But perhaps you saw the song-thrush hammering the snail on a stone, and said, 'Why should I make a shell for that? Heavy defensive armour is a mistake under modern conditions of warfare.' And perhaps you realised how convenient the snail's shell was for the glow-worm grub which wanted to feed on the soft body. Those other beetles, too, which take the little snails and break the shells by knocking them against their own hard bodies! Shells unable to protect even against beetles! And then, perhaps, we think of the oyster, so well protected in that massive two-valved shell. But a star-fish—surely of all enemies the one least calculated to alarm the well-armed oyster!—comes along, and getting astride the oyster, forces it to open. And the star-fish eats the soft body. Not even the strongest shell is sufficient to protect so delicious a morsel! Would it not have paid the oyster better to become nauseous?

And the slug! One could suggest several ways in which the absence of a shell might be advantageous. It is a great weight for the snail to carry about with it. And the making of the shell means the secretion of the necessary substance by the expenditure of vital force. It also involves a certain amount of time spent by the snail in house-building. Yes, were the snail only out of the way, if we might be excused the shell, we could easily evolve you the slug. The shell was a disadvantage, a handicap. Those with the smallest shells had the least weight to carry, and so more energy for the work of feeding. The snail was an old conservative, and went on making a shell because its grandfather did.

But which *did* come first, the snail or the slug? Most people will probably say the slug—the shell is the thing that must have been evolved. There must have been, to start with, a soft-bodied animal without a shell. How did the shell begin? Was the first attempt large enough to cover the body? Nothing smaller could be of much use. And the evolution of a hard protective shell involves the belief that those which did not develop it perished in the struggle for life. Hence there could be no slugs. On the other hand, we ask, Can

natural selection—even in theory—evolve a thing which an animal could quite well do without, and which, when present, does not prevent its being destroyed by its enemies? If the slug were only out of the way, we could evolve the snail. Or if the snail would only show signs of dying out through the attacks of birds and beetles, the evolution of the slug would present no difficulty. But the two together! And that little shell which the slug hides in its mantle? Why, having accomplished the *much* of reducing its shell to almost microscopic size, should it find the *little more* of getting rid of it altogether too much for it? Does the slug retain its shell as a coat of arms, a proof that it really belongs to the noble race of the shelled ones? One had thought that natural selection had taxed such luxuries out of existence. But those who accept the recapitulation theory in biology will say that the presence of that minute shell in the slug's mantle means that it is descended from a snail. Finally, without deciding which was descended from which, we must admit that each seems to have obtained in some way a great advantage in the struggle for life.

JUSTICE.

By MICHAEL TALBOT.

I.

THE blistering summer sun had gone down. A faint breeze moved the maidenhair fern on the cliffs from time to time, and rustled softly amongst the palms in Dick Ferrar's garden; while from below, the lazy thud of the Pacific breakers rose and fell monotonously.

Miraflores is a peaceful spot to come home to after a busy day in a sweltering Lima office.

Dinner in the little white *rancho* was over, and Dick Ferrar and his guest rose from the table, removing their white coats thankfully. Standing by the open window, they watched the lights of some big liner making for Callao harbour.

Behind them, a pleasant-faced Peruvian servant moved softly about the room, her wrinkled face as impassive as her surroundings.

'Good Lord! Uncle Dick,' said the young man, breaking a long silence, 'this calm is enough to get on a fellow's nerves. Does nothing ever happen here? I believe every one is born asleep, and only wakes up in time to die. These Peruvians haven't got any spirit. Why, down south——' Dennis Ferrar stopped abruptly, remembering that his uncle, who had spent many years in the neighbouring state of Chasco, would be unlikely to benefit from his immature comparisons.

Dick Ferrar made no reply other than a smile, and both men settled down in comfortable cane chairs. The Peruvian maid brought in decanters and soda, inquiring whether Don Ricardo needed anything further. Don Ricardo replied that he did not, and added that she might go to bed as soon as she wished. She lingered, however, some moments, expressing a hope that Dennis would find his room comfortable. She finally retired with a smiling *buenas noches*, and her footsteps died away across the stone *patio*.

Dennis, who had come up from Chasco on a month's holiday, was comparatively new to South America. With his flaxen hair and almost brick-red face, he presented a striking contrast to his uncle, whose white hair and yellow skin seemed to have been bleached by long exposure to a tropical sun.

'That maid of yours speaks like a professor of elocution,' remarked the boy, nodding towards the door.

Dick looked up from filling an ancient pipe, and replied, 'My dear fellow, any Peruvian workman or servant could turn you off a speech which would make a Hyde Park stump-orator sound tongue-tied. And, what's more, it would be perfect Spanish.'

'Well, it's mighty different in Chasco,' returned the younger man, laughing. He took up a book which he had been reading, and settled himself deeper into the chair. The other still sat with his pipe between his teeth, gazing out over the moon-lit cliffs.

A heavy ox-cart passed down the road, creaking on its slow way, till the sing-song exhortations of the sleepy *carreteros* died away in the distance.

At length Dennis closed his book, and stretched himself.

'What have you been reading?' inquired the other, bringing his thoughts back to the room.

'*The Four Just Men*, by Edgar Wallace. Have you read it?' He outlined the plot to his uncle, describing the adventures of the four men who set out to punish such wrong-doers as succeeded in remaining beyond the reach of the law.

'But don't you think most people get their deserts sooner or later, without the aid of amateur judges?'

'No, I don't think that a great many do,' replied the boy, with some emphasis. 'In Chasco, I know lots of people who have managed to wriggle out of corners, merely because they were rich enough to do a little judicious, or rather judicial, bribery.'

'There are exceptions, however,' returned Ferrar, 'and I have seen a great many of them. I think I could tell you a little story which

would illustrate both your point of view and mine, if you would care to hear it.'

A further incursion on the decanter followed; then Dick Ferrar began his story.

II.

'It is quite a long time since I first came to this benighted continent. Like yourself, I was fresh from school, and, like yourself, went to Chasco; but the nitrate *pampa* was my first experience. I earned a hundred pounds a year and my keep, and worked more than twelve hours a day.

'I was sent to Oficina Placer, on the south *pampa*, as *fichero*. My duties consisted of paying the workmen and keeping their accounts. This meant getting out of bed at half-past four in the morning, and slinging out greasy, half-frozen token-money through a barred window to sleepy men and women. The cold fog which blows up from the sea at night chilled me to the bone; and the strong aroma of unwashed humanity which sleeps in its clothes did not make the job more pleasing. Incidentally, I spent a good deal of the day trying vainly to account for the fact that I had paid out some two thousand and eight pesos, while my book showed some two thousand. During my first few months of work I lost over seven hundred pesos, my complexion, and my faith in the supremacy of youth; but I laid in a lot of salutary experience.

'The men were largely Chascans, but there was a fair sprinkling of Bolivians and Peruvians besides. Amongst these latter, especially, I made several friends; and, on the whole, I think I was generally liked by the workmen. Of course, they gave trouble from time to time, and it was rare that a feast-day passed without some man exploring his neighbour's interior with the little curved knife which all carry at the waist. When these incidents occurred, the *carabineros* were sent for from the little town of Placer, which lies on the railway line, two or three miles to the eastward, and thither the offenders were taken for trial.

'To you living in a big city, the town would be enlightening. It was a dirty agglomeration of corrugated iron shanties. Uneven sand-tracks served for roads, and any man riding down one of these invariably found a pack of great mongrel dogs barking at his horse's heels, and even leaping at the unfortunate animal's throat.

'Just to stand within the town was to feel your every evil instinct rise to the surface.

'The leading members of the community were the judge, the station-master, the priest, and a one-eyed bar-keeper of villainous appearance. The lesser population were largely Chinese store-keepers and Chascan dancing-girls.

'A vicious circle of the commercial variety was formed. Each of the petty powers mentioned bartered his particular commodity in return for those of the other three. For instance, the judge doled out a satisfactory and amended form of justice for his three colleagues, while they gave in return free coal, the most emphatic assurance of heaven, and free drinks, as their trades provided. The judge, a local celebrity, was a particularly offensive little man. With five feet of self-assertive dignity, fierce moustache, and prominent teeth, he lisped and wore a permanent smile which contained no amusement whatsoever. In private life he had been a piano-tuner, but political changes had brought him into favour; and, knowing his position to be by no means permanent, he feathered his nest with zeal.

'He paid highly to those above him for his post, and so saw to it that in the course of justice he repaid himself adequately.

'Each Oficina paid him what was euphemistically termed a subvention; but this regular monthly payment was, in reality, merely a bribe to ensure a satisfactory verdict where the law was concerned. He took this money as a right, and had no scruples over appearing in person with indignant gesticulations were it not paid with becoming regularity on the first of each month.

'Among the Peruvian workmen I mentioned was one who acted as night-watchman in the *campamento*. His hut lay quite near the Administration House, and I often used to drop in on my way back from the office to chat with him and his wife. I found it good practice for my Spanish; moreover, his dignified hospitality and exaggerated courtesy pleased, while it amused me. He was quite small, and lightly built; but, with the classic features of his Spanish ancestors, he really cut a very striking figure.

'He viewed the coarser Chascan type with infinite disdain, and never tired of explaining to me how the Spanish nobility colonised Peru, leaving the soldiery to fight for the less fertile lands to the south. However, he had the intelligence to dissimulate his feelings when with his companions, and so kept his skin whole. As night-watchman, he was completely contented. He liked the solitude and the freedom from manual labour, taking considerable pride in his delicate hands and finger-nails. Night found him swathed in thick vicuña *ponchos*, seated on an upturned bucket outside the office. Here, smoking a chain of little brown cigarettes, he passed nearly all his waking hours. This habit of being awake while others slept increased his sense of superiority. So long as his pretty little wife continued to keep his diminutive two-roomed home clean and comfortable, and to serve sufficient and tasty meals, he asked no more. Though earning only four and a half pesos a day, he felt not the slightest ambition to descend to the noisy arena of labour for the extra money he might thus have earned.

'Of course, as a Peruvian, he had few friends; but, as he was inoffensive, men did not actually ill-treat him, being contented merely to jeer at him occasionally. This, however, troubled him in no way. No jeers can penetrate so thorough a self-complacency.'

III.

'I think I must have been working in Placer rather more than a year when the event which I am going to relate took place.

'For one thing and another, we were then using a good deal of copper in the Oficina. And as copper in the Oficina region is by no means cheap, it now appears to me as very careless that it should have been allowed to lie unloaded over night on the railway-trucks. But it always was so left, and we soon began to miss quite a lot. Of course, the Peruvian—Castro—was hauled over the coals. The manager sent for him, and made some comments upon his uselessness as a watchman, which hurt his pride and temporarily brought about a burst of energy. He took to deserting his bucket at intervals, and watching the railway siding, though from a discreet distance.

'His efforts were rewarded, and some days later he entered the office with a great show of importance and asked to see the manager. He spun a long yarn about the peculiar discomforts he had suffered on his vigil, and, when the manager's patience was all but exhausted, he came to the point. He had seen one Alvarez, a carpenter, coming from the siding with a bundle on his back.

'What followed is briefly told. We searched Alvarez's hut while he was at work, found the copper, and sent for the *carabineros*.

'He was little surprised at being arrested, and took it very calmly till he discovered that Castro had laid information. The idea that this Peruvian rat should have dared to give him away produced in him a frenzy of wrath, and the *carabineros* had some difficulty in getting him away.

'The judge tried the prisoner next morning, found him guilty, confiscated his money, and sentenced him to one month's imprisonment. However, he was liberated after a week, as his keep cost money, and so was a drain on the official resources.

'On coming out of jail the carpenter instantly returned to the Oficina, and gathering his friends together, poured out a considerable tale of woe.

'Alvarez being a prominent member of the Socialistic league, a meeting was called forthwith. The object of this is uncertain, but the outcome was as simple as natural. The Socialists became very drunk, and gradually dispersed, not quite certain what had actually been decided.

'I shall have to draw on my imagination to some extent for the details of the tragedy which was enacted that night in the *campamento*. The facts, however, were plain enough, and there is little doubt that what occurred was more or less this.

'Alvarez left the meeting with his grievance fanned to fury by the fiery *aguardiente*, which his friends had been pressing on him all the evening. This drink, a raw brandy, which is almost pure alcohol, produces a form of drunkenness which, in the system of an easily excited people, is not far from madness.

'His knife was gone, so he rushed to his hut, and blindly seized the first weapon to hand, a heavy-headed chopper.

'Castro, one supposes, was seated on his bucket, quite unaware of the prisoner's release, and without a care in the world. You can picture him, his head thrown back against the office wall, a cigarette in his mouth, his arms folded within the warm *poncho* which hung from his shoulders.

'When the distorted face of the carpenter appeared within the little circle of light cast by the lantern, he was momentarily paralysed. The bloodshot beast-like eyes and dilated nostrils fascinated him. With a yell of exultation, Alvarez raised the murderous chopper, and leapt upon the terror-stricken man. The latter had no chance whatsoever. His arms were hampered by the heavy rug, and he did not even succeed in getting to his feet.

'The chopper, wielded by a master-hand, crashed through his wide-brimmed hat, and embedded itself in the Peruvian's skull. He died without a sound, and rolled over sideways from the bucket, the steel remaining fixed in his head.

'The carpenter stood back, breathing heavily, and watched the crumpled figure on the ground quiver a few times, then become perfectly still. By this time the fumes of the *aguardiente* were beginning to cloud his mind, and he made no attempt to escape, but remained gazing dully at his handiwork. The yell had aroused the men sleeping in the neighbouring huts, and a crowd had formed around him before he took his eyes from the ground. Amongst these was the chief foreman, who immediately took charge of the proceedings. Alvarez, still stupefied, was dragged up to the Administration House. He made no resistance, and did not appear to understand any remarks addressed to him.

'The manager, used to such incidents, took the affair very calmly indeed. He contented himself with summoning the *carabineros* and returning to bed. Within five minutes, I am sure, he had dismissed the whole matter from his mind.'

IV.

'I, however, was young and new to such tragedies, and, unable to sleep, dressed and went down to the camp. Castro's poor young wife

was standing bewildered at the door of her hut. A crowd was engaged in breaking the news. At least four men were speaking at the same time, and they were telling the story with a zest that sickened me. At my approach they moved off, and left me alone with the girl. My Spanish entirely deserted me, and I could not frame one single phrase of sympathy. She stood for a while silent and dry-eyed, leaning against the door-post, then went back into the room and closed the door. I lingered a moment in the street, feeling inexpressibly useless, and at last walked slowly back to the Administration House.

'A few days later the judge summoned Alvarez, and delivered a pompous address on the murder. He announced that the trial would take place in a fortnight, and offered to liberate the murderer on a bail of two thousand pesos. The Socialists responded with a mass meeting, and the money was produced. The judge appropriated the bail, and Alvarez was permitted to leave the prison.

'At the time such a procedure appeared to me as monstrous, but I now see nothing unusual in it. I strongly suspect that if Alvarez had returned at the expiration of his bail, the judge would have asked him candidly if he would clear out for fifteen hundred pesos. But, as it was, no such course was necessary. Alvarez was put quietly over the Andes into Bolivia, and the judge kept the two thousand pesos. Of course, he was forced to make some show of search, but I don't fancy that he overdid it.

'The Oficina sent Castro's wife back to Peru with a little money, and the whole affair was soon forgotten. The judge was the richer by two thousand pesos, and the Oficina Socialistic league was the same amount poorer, and there the matter ended.'

At this point Dennis, who had listened with increasing interest to his uncle's story, interrupted. 'Well, Uncle Dick, doesn't that bear out my argument? That's the sort of incident which the "Four Just Men" would have found most deserving of attention, as the sinner got off scot-free.'

'Just a moment, my friend,' replied Dick Ferrar, reaching for a siphon and refilling the glasses. 'Wait for the sequel before calling your "Just Men" into requisition.'

He sat a while in silence with eyes closed, his fingers playing idly on the rim of his glass. 'Yes, there is a little more to the story.' He straightened himself in the chair and continued. 'It is a curious coincidence that I was fated to know the epilogue, for, as you will hear, it occurred many years later and many miles from Placer.

'Manuela Castro, the watchman's widow, on her return to Peru started a little *posada*—an eating-house for workmen—in Lima. Her beauty faded quickly with the hard work, and she did not marry again. At first she had many suitors, but as the years passed men left her alone.

'One day a surly-faced southerner came to the *posada* and called for food. He said he had been working on the new port works in Callao, but was up in Lima looking for a better-paid job. Manuela recognised him instantly as the carpenter of Placer, but made no sign. She chatted with him for a while, and soon was assured that he was quite ignorant of her identity. No one called her anything but Manuela; so he never heard the name which might have put him on his guard. Manuela seemed overcome by his manly charms, and omitted to charge him for his lunch; consequently he reappeared for supper. The same thing happened; so he spoke at rarer intervals about his search for work, and spent most of the days at the *posada* lounging and smoking. He naturally supposed Manuela to be in love with him, and continued his life of ease, bragging of his conquest.

'The habitués of the *posada* did not take to the Chascan, and looked with astonishment at the figure of Manuela dancing humble attendance on this unprepossessing stranger. But they regarded it with easy philosophy, and awaited her marriage without interest.

'But what happened was entirely different. The carpenter was found with a knife-wound in his throat, lying in the ditch beside the road from Lima to Callao.

'Manuela herself identified the dead man. She made a pathetic scene at the inquest. Considerable sympathy was felt for the poor woman whose lover had been done to death on the eve of their marriage.

'There was a good deal of feeling at the time between Chasco and Peru, and such murders had been frequent. Investigation threw no light upon the crime, and the matter was soon allowed to drop. Manuela wore black and spoke little and sadly for a while. But within a few months both the mourning and the gossip ceased, and the *posada* continued its little business much as it had done before the carpenter arrived.'

Dick Ferrar ceased, and knocking out his pipe, turned to his nephew, who still sat silent, thinking over what he had heard.

'Well, I'm damned,' said the boy at length; 'so he got what he deserved, after all.' Then, after a pause, 'But how the devil did you come to know all about it if the police didn't?'

The other only smiled and led his guest up to his room. 'That part of the story is not mine to tell,' he concluded.

Over the kitchen, in a little room buzzing with mosquitoes, the old servant slept the sleep of the just. On her wrinkled face was a contented expression, and her mind was dreaming of a little two-roomed hut on the *pampa*.

THE SEVEN LAMPS OF ADVOCACY.

By His Honour Judge PARRY.

II.—THE LAMP OF COURAGE.

The Seven Lamps of Advocacy are *Honesty, Courage, Industry, Wit, Eloquence, Judgment, and Fellowship.*

ADVOCACY needs the 'king-becoming graces: devotion, patience, courage, fortitude.' Advocacy is a form of combat where courage in danger is half the battle. Courage is as good a weapon in the forum as in the camp. The advocate, like Cæsar, must stand upon his mound facing the enemy, worthy to be feared, and fearing no man.

Unless a man has the spirit to encounter difficulties with firmness and pluck, he had best leave advocacy alone. Richard Bethell, Lord Westbury, in early life took for his motto: '*De l'audace, et encore de l'audace, et toujours de l'audace.*' In advising on a case he was always clear and direct, saying that he was 'paid for his opinion, not for his doubts.' Charles Hatton, writing as a layman of Jeffreys in his early days at the Bar, shrewdly notes his best quality: 'He hath in perfection the three chief qualifications of a lawyer: Boldness, Boldness, Boldness.' A modern advocate kindly reproving a junior for his timidity of manner wisely said, 'Remember it is better to be strong and wrong than weak and right.'

The belief that success in advocacy can be attained by influence, apart from personal qualifications, is ill-founded. There was never a youngster with better backing than Francis North, afterwards Lord Keeper to Charles II., yet, as his biographer says, 'observe his preparatives,' his earnest attendances at moots, his diligent waiting in that 'dismal hole' the 'corner chamber, one pair of stairs in Elm Court.'

In the same way his younger brother, Roger, though born in the ermine, so to speak, had to plod his way up like any other junior. It is good to be the brother of a Lord Chancellor, but it does not make a man an advocate.

Roger North's autobiography is full of interest to the student of advocacy. His memory of his first appearance is vivid and entertaining. 'I was immediately called,' he writes, 'to the Bar, *ex gratiâ*, not having standing, although I had performed such exercises as the house required, save a few. My first flight in practice was the opening a declaration at *nisi prius* in Guildhall, under my brother, which was a crisis like the loss of a maidenhead; but with blushing and blundering I got through it, and afterwards grew bold and ready at such a formal performance; but it was long ere I adventured to ask a witness a question.'

Roger North would never have attained the eminence he did in his profession by merely hanging on to the gown of his greater brother. Hard work and dogged courage, not patronage, earned him the dignities he achieved. The description of his early beginnings is full of encouragement for the young advocate. 'During my practice under Hales,' he says, 'at the King's Bench I was raw, and not at all quaint and forward as some are, so that I did but learn experience and discover my own defects, which were very great. I was a plant of a slow growth, and when mature but slight wood, and of a flashy fruit. But my profession obliged me to go on, which I resolved to do against all my private discouragements, and whatever absurdities and errors I committed in public I would not desist, but forgot them as fast as I could, and took more care another time. My comfort was, if some, all did not see my failings, and those upon whom I depended, the attorneys and suitors, might think the pert and confident forwardness I put on might produce somewhat of use to them.'

North held the sound opinion that 'he who is not a good lawyer before he comes to the Bar, will never be a good one after it.' It is very true that learning begets courage, and wise self-confidence can only be founded on knowledge. The long years of apprenticeship, the studious attention to 'preparatives,' are, to the advocate, like the manly exercises of the young squire that enabled the knight of old to earn his spurs on the field of battle. In no profession is it more certain that 'knowledge is power,' and when the opportunity arrives, knowledge, and the courage to use it effectively, proclaim the presence of the advocate.

The best instance of what is meant perhaps may be found in Sir John Hollams's account of the first appearance of Mr Benjamin. He was a great lawyer before he addressed the court,

 [*All Rights Reserved.*]

but he sat down a great advocate. It was in a case which came on for hearing before Lord Justice James, when Vice-Chancellor, and 'it appeared to be generally thought that, as usual at the time, a decree would be made directing inquiries in chambers. The matter was being so dealt with when Mr Benjamin, then unknown to any one in Court, rose from the back seat in the Court. He had not a commanding presence, and at that time had rather an uncouth appearance. He, in a stentorian voice, not in accord with the quiet tone usually prevailing in the Court of Chancery, startled the Court by saying, "Sir, notwithstanding the somewhat off-hand and supercilious manner in which this case has been dealt with by my learned friend Sir Roundell Palmer, and to some extent acquiesced in by my learned leader Mr Kay, if, sir, you will only listen to me—if, sir, you will only listen to me" (repeating the same words three times, and on each occasion raising his voice), "I pledge myself you will dismiss this suit with costs." The Vice-Chancellor and Sir Roundell Palmer, and indeed all the Court, looked at him with a kind of astonishment, but he went on without drawing rein for between two and three hours. The Court became crowded, for it soon became known that there was a very unusual scene going on. In the end the Vice-Chancellor did dismiss the suit with costs, and his decision was confirmed on appeal.'

There have been many advocates whose courage was founded on humour rather than knowledge, and who have successfully asserted their independence in the face of an impatient or overbearing Bench through the medium of wit, where mere wisdom might have failed in effect.

Of such was Tom Jones, who startled Mr Justice Byles into indignant attention by opening his case with bold impertinence: 'No one, my lords, who looks at this case with common fairness and honesty, can hesitate for a moment in declaring that there ought to be a new trial.'

Byles observed, 'This is rather strong language to use to us, Mr Jones. I hope you think that we, at the least, are commonly fair and honest.'

'We shall see, my lord,' said Tom; 'we shall see.'

Serjeant Robinson tells us a further good story of his refusal to be hustled by the Bench.

'Our friend Tom Jones,' he writes, 'was a little lengthy sometimes in the exposition of his client's rights, and one day the chief baron said to him, "Mr Jones, this case has occupied a great deal of time, and we have a very long list of cases to get through."

'"My lord," said Tom, "I have carefully looked through that list, and I did not find there was a single cause in which I or my client was in the slightest degree interested."'

But these sallies should never degenerate into mere incivility or abuse, in which there is little real courage, since a judge of sense will always refrain, if it be at all possible, from reply to such attacks, which only injure the reputation of the Bar and destroy the reputation of the advocate.

In the early day of American Sessions a certain judge was violently attacked by a young and very impudent attorney. To the manifest surprise of everybody present, the judge heard him quite through, as though unconscious of what was said, and made no reply. After the adjournment of the day, and all had assembled at the inn where the judge and many of the attorneys had their lodgings, one of the company, referring to the scene in court, asked the judge why he did not rebuke the impertinent fellow.

'Permit me,' said the judge, loud enough to call the attention of all the company, among whom was the fellow in question—'permit me to tell you a story. My father, when we lived down in the country, had a dog—a mere puppy, I may say. Well, this puppy would go out every moonlight night and bark at the moon for hours together.' Here the judge paused, as if he had done with his story.

'Well, what of it?' exclaimed half-a-dozen of the audience at once.

'Oh, nothing, nothing whatever; the moon kept right on, as if nothing had happened.'

Independence without moderation becomes licentiousness, but true independence is an essential attribute of advocacy, and the English Bar has never wanted men endowed with this form of true courage. The sacrifice of the highest professional honours to the maintenance of principle has been a commonplace in the history of English advocates, and the names of the living could be added if need be to those who have passed away, leaving us this clean heritage as example.

The true position of the independence of the English Bar, the right and the duty of the advocate to appear in every case, however poor, degraded, or wicked the party may be, is laid down once and for all in a celebrated speech of Erskine's in his defence of Thomas Paine, who was indicted in 1792 for publishing the *Rights of Man*. Great public indignation was expressed against Erskine for daring to defend Paine. As he said in his speech, 'In every place where business or pleasure collects the public together, day after day, my name and character have been the topics of injurious reflection. And for what? Only for not having shrunk from the discharge of a duty which no personal advantage recommended, and which a thousand difficulties repelled.'

He then continued, in words which the learned editor of Howell's State Trials emphasises by printing in capital letters, as stating one of the basic principles of English advocacy:

'Little, indeed, did they know me, who thought that such calumnies would influence my conduct: I WILL FOR EVER, AT ALL HAZARDS, ASSERT

THE DIGNITY, INDEPENDENCE, AND INTEGRITY OF THE ENGLISH BAR; WITHOUT WHICH, IMPARTIAL JUSTICE, THE MOST VALUABLE PART OF THE ENGLISH CONSTITUTION, CAN HAVE NO EXISTENCE. From the moment that any advocate can be permitted to say that he will or will not stand between the Crown and the subject arraigned in the court where he daily sits to practise—from that moment the liberties of England are at an end. If the advocate refuses to defend, from what he may think of the charge or of the defence, he assumes the character of the judge; nay, he assumes it before the hour of judgment; and, in proportion to his rank and reputation, puts the heavy influence of perhaps a mistaken opinion into the scale against the accused, in whose favour the benevolent principle of English law makes all presumptions, and which commands the very judge to be his counsel.'

Side by side with this may be set the grand example of William Henry Seward, in acting in the defence of the negro Freeman in 1846. A horrible murder was committed. Without any provocation or desire for plunder, Freeman killed a farmer and several of his family. He was easily captured, when he laughed in the face of his captors and acknowledged the crime. He was a recently emancipated slave, deaf, and obviously insane. The sheriff had the greatest difficulty in preventing him from being lynched. The clergyman at the victims' funeral made a rousing appeal for his punishment, which was printed and circulated round the district.

Seward undertook his defence, and a storm of prejudice and passion was directed against him to dissuade him from doing what he believed to be his duty as an advocate. In the crowded court-house, when the judge asked, 'Will any one defend this man?' and Seward rose, and said he was counsel for the prisoner, a murmur of indignation ran round the court. His advocacy was of no avail to the individual, but his eloquent speech remains a noble statement of the duty of the advocate, and a fine example of devotion and courage in the exercise of that duty.

The whole speech is worthy of study, as it contains a glowing and reasoned appeal for the right of the most degraded human being in a civilised state to a real hearing of his case in a judicial court, which can only be obtained through honest and competent advocacy.

As the yellow harvest-moon rose outside the darkening court-house his peroration was listened to by the indignant crowd with, at least, outward respect, and it remains a message of encouragement to the advocates of future generations.

'In due time, gentlemen of the jury, when I shall have paid the debt of nature, my remains will rest here in your midst with those of my kindred and neighbours. It is very possible they may be unhonoured, neglected, spurned! But perhaps years hence, when the passion and excitement which now agitate this community shall have passed away, some wandering stranger, some lone exile, some Indian, some negro, may erect over them an humble stone, and thereon this epitaph: "He was faithful."'

These words, as he desired, are engraved on the marble over him, and he is remembered at the American Bar as an advocate who upheld its best traditions, and feared not to hold aloft the Lamp of Courage.

MAN'S WORK.

CHAPTER IV.—*continued.*

III.

SITWELL talked on, gradually convinced that his chance of success was better with the mother than with her gray-eyed daughter, who was on the back-seat chatting with animation to Claudia. When they drew up at the apartment Mrs Winter was visibly impressed. She laughingly compared it with her own one-storey farmhouse, with the creaking well, the watch-dog, and the stoop, where she sat knitting in the long summer evenings. Claudia, listening to her, had a deep yearning for such a scene as this, for its thrift, its peace, and contentment. She wondered why any one should leave it. Perhaps such a haven was in sight even now.

That afternoon, when Mrs Winter had retired to rest, the two girls talked long and happily. Edith's eyes were full of sympathy when Claudia told of her father's death.

'My own life isn't half as interesting as yours,' she said presently. 'I was born on the farm—no brothers or sisters—my father died six years ago. I went to a high school, and then took a correspondence course in stenography. I could have got a job in Chicago, but mother wanted me to stay with her. Father left her the farm and twenty thousand dollars in Government bonds. Mother thinks she can double this, and that's why she's here. By-and-by, when I'm married, she wants me to live more—well—like you do.'

Claudia caught her breath. This was the way she was living, and her husband had now hardly one thousand dollars, and no farm. The irony of the thing was bitter.

'Why does she want you to do that?'

'I don't really know. She's tired of quiet, and cows coming home to be milked, and danger of late and early frosts. I suppose when you've

lived fifty years on a farm you want to get away from it. She's coming to me after I've been married a year.'

Claudia smiled her congratulations. 'When will that be?'

'Perhaps next year—yes, I think so. Jim—Jim Hunt has a job in New York with a very big firm. It isn't much to begin with, but there's something better ahead.' She paused for an instant and regarded Claudia admiringly. 'You must be happy in such a lovely place—that is, you will be, won't you?' she added, with a touch of embarrassment.

'Do you think you'd like to live out here?'

'I—I can't tell; it's all so different; but it's the Golden West and the Land of Opportunity. Jim tells me that I may have to live in awful places—log-cabins and all sorts of things. Would you like to see his photograph?'

'Very much.'

Edith blushed a little and opened her bag. 'Here it is. Isn't it nice? He's twenty-five—two years older than I am.'

Claudia looked. The face seemed strangely familiar, with eyes set far apart, a steady mouth, and a look of quiet determination. Presently the resemblance came to her, and the blood crept to her temples. The picture was like Shanklin cast in another physical mould, but endowed with the same qualities, the same manner of confidence, the same fearless frankness. Even the eyes were Shanklin's, and she felt a strange thrill at meeting them.

'What do you think of him?' asked the girl.

'He looks good enough—even for you,' said Claudia a little unsteadily.

'Thank you, for both of us.' The gray eyes grew very soft. 'We won't be married till he has the position he wants. He says that there are lots of hard knocks anyway in his profession, and we'll have to take them together, the bitter with the sweet. Don't you find it wonderful,' she went on wistfully, 'how much two people who really understand can be to each other?'

Claudia nodded. Those unsought confidences were becoming more than she could bear. What if the whole truth were suddenly revealed to those clear, honest eyes? This girl was unfolding herself in the flush of a new friendship, but Claudia had nothing to say in return. Edith Winter was engaged to a man amazingly like John Shanklin. She almost certainly would marry him and share his hard knocks; but what a joy to meet the brunt of blows met in the open, rather than the stabs she herself was now receiving in secret!

'You are going to be wonderfully happy,' she said, 'and there mustn't be any secrets between you?'

The girl looked up. 'Why should there?'

Claudia laughed. 'That's what I thought three months ago.' Then swiftly she changed the subject.

That evening Sitwell spread maps and plans on the table, and with the Winters on either side of him talked Enterprise for an hour. It was the first time his wife had seen him, so to speak, in action; and she was struck with his versatility and memory. The plans were, without question, compiled with the object of showing the Enterprise ground as close as possible to its plutocratic neighbours, and the impression gained at a first glance was that the locality was highly favourable.

Mrs Winter's eyes rounded as she heard of the value of producing-wells hard by; of treasure that gushed from soil which looked very similar to that in which her annual crop of cabbages came to maturity. But Edith laughingly confessed that plans always puzzled her, and that she would rather wait till she saw the actual thing itself.

'Even then,' she went on, 'I sha'n't know anything, or mother either.' She paused, then added with a touch of daring, 'Have you much invested in it yourself, Mr Sitwell?'

'Nearly everything I have has gone into the Enterprise,' he replied promptly.

Edith nodded, but seemed unimpressed, and Sitwell, noting the regular contour of her young face and the decision in the curve of her sweet lips, had a fleeting anxiety that here he might strike something to disturb his programme. But, he reflected, it was the mother, and not the daughter, who held the financial reins. And he was glad of that.

'Then we'll drive out and see it to-morrow; is that the plan?' said Mrs Winter.

'Yes, if it suits you.'

'It will be delightful. And,' she laughed, 'you won't forget that we're two women, and want a bargain, and even then we'll take a long time to make up our minds?'

'Just as long as you please,' replied Sitwell with all the gallantry he could muster. It was in his mind that the thing would be done soon—or never.

'We've come to a rather diverting place, so you must make allowances,' Edith hazarded, and, turning, examined with interest the books that lined one end of the room.

'How fortunate your wife is!' she went on. 'I see a lot here that I've meant to read. This, for instance—and this.' She took down several volumes, one after the other, fingering the leaves with the touch that proclaims one a real lover of the printed page.

'Oh, what a nice-looking man!' A photograph had slipped out of *Marcus Aurelius*, and Edith regarded it with instant attention. Something in the level eyes, the contour of the mouth, the set of the figure with its atmosphere of confidence and sincerity, captured her imagination. This man might have been Jim Hunt's brother. 'Who is it?' she asked.

Sitwell glanced across the table and saw Shanklin's features smiling at him.

'That,' he said coolly, 'is a very deceptive face—a man we used to know well until he turned out disloyal and tried to play a nasty trick, which didn't work. I didn't know there was a picture of him in the place.'

There fell a little silence. Mrs Winter looked up with a touch of surprise. Claudia sat motionless—this being a moment for which she could find no words; while Edith stood perplexedly, the photograph still in her hand. She had apparently unearthed something awkward and uncomfortable. But, in spite of Sitwell's cynical tone, she silently refused to believe that this was the face of a man either tricky or disloyal.

'How queer!' she said, with the faintest colour in her cheeks. 'I should never have guessed that. He 's too like my Jim.'

(*Continued on page 120.*)

THE CITY OF LONDON AND ITS CEREMONIALS.

By A. J. GLASSPOOL, Late Keeper of the Guildhall.

I.

THE City of London can claim but a small territory—only a trifle over one square mile. Here throbs the heart of the British Empire.

The City's ancient methods of procedure have been found so excellent that the national Parliament and more modern local bodies have been glad to adopt them.

The Aldermen of the City of London have their Ceremonial Book. It is a work that is never completed; it receives constant amendments and additions. Old practices are altered; new circumstances make fresh precedents. Every copy is, therefore, marked 'Proof.'

The ceremonies of to-day are the ceremonies of centuries ago. It is in these ceremonies that the Corporation of the City of London shows its conservative character.

While seriously adopting all the best modern methods of cleansing and lighting the streets, while promoting Acts of Parliament to change the system of electing its members and collecting its rates, it has at the same time fought earnestly to maintain the precedence of the Lord Mayor on national occasions.

The details of these ceremonial instructions are very minute, even as to when the Lord Mayor is to take off his hat, and when he is to keep it on. Let us take a peep into the Ceremonial Book, so carefully guarded that the Guildhall library does not possess a copy.

On certain occasions white gloves are to be worn; at the swearing-in of the coming Lord Mayor certain officers are to make their obeisances at measured distances from his lordship.

The dignity of an Alderman of the City of London is of such priceless value that regulations as to dress are very carefully stated. Aldermen are reminded that it is etiquette, when discharging public duties for which no special costume is provided, to appear in dark morning-dress, with white or black tie. They are never to appear in flaunting Republican neckwear or lounge-coat. An Alderman in tan boots on public occasions, except when in khaki, would commit an unpardonable offence.

Old customs are always interesting; the exhibition of ancient emblems of authority adds greatly to the impressiveness of a ceremonial.

The facts that the City sceptre dates from the time of good King Alfred, and that the pearl sword and the City purse were gifts from Queen Elizabeth, and the knowledge that you are doing to-day what your predecessors did centuries ago, add to the zest of a ceremonial, however simple it may be.

The Lord Mayor's wardrobe must be of considerable extent; various duties demand that different robes should be worn. As a magistrate, he wears a violet robe; as president of the Court of Aldermen, the Court of Common Council, and the Common Hall, he wears scarlet.

At ordinary entertainments, and at the 9th of November banquet, the Lord Mayor wears his black-silk gown, adorned with gold lace; when entertaining royalty, he is resplendent in his earl's robe of scarlet velvet and ermine cape.

Add to these the mazarine gown he may have worn as a Common Councilman, his Deputy Lieutenant's uniform as a Deputy Alderman, his court-dress, and other minor embellishments, made still more resplendent by the S.S. chain and the jewel of office, and you have a variety of costumes and decorations of which Solomon in all his glory might have been justly proud.

When simply a mere Alderman he has many opportunities of personal adornment; with his violet or scarlet gown and his court-suit he is able to add sartorial dignity to a procession. Some of the instructions as to uniform are very exacting. The Alderman is requested to wear 'black-velvet court-suit, steel buttons, lace jabot and ruffles, sword, silk stockings, shoes with steel buckles, court crush-hat with steel ornaments.'

The City Common Councilman is only troubled with his mazarine gown and official hat. On special occasions, when interviewing the sovereign or entertaining royalty, he must wear a black suit, with a white tie and white gloves. An exacting monarch may even demand that he adorn himself in a court-suit. When, however,

he rises to the dignity of a Deputy Alderman, he is entitled to wear the gorgeous uniform of a Deputy Lieutenant, which closely resembles that of a Field-Marshal.

II.

The City ceremonies are strictly observed. The Lord Mayor must be first an Alderman, and as such he is elected by the citizens of his ward, by the same method as that carried out for the election of a Member of Parliament.

Provided he was not a City Sheriff before becoming a City Alderman, he must now be elected to that office. A totally different method of election is employed on this occasion. The electors are the members of the City Companies in Common Hall assembled. In order that only the genuine electors may be admitted to the hall, the Guildhall yard is fitted up with a number of small gateways, over which are placed the names of the Livery Companies.

The electors are admitted through these gates, being recognised by the beadle of the company of which they are members.

The Common Crier opens the proceedings by calling upon all present to give their attention; they are to take off their hats, and those who are not liverymen are to depart from the hall on pain of imprisonment.

The Lord Mayor, however, keeps his hat on. The Recorder, or, in his absence, the Common Serjeant, then makes three obeisances to the Lord Mayor and the Livery, and states for what object the Common Hall has been summoned.

At this point of the proceedings we have an exhibition of the extraordinarily democratic character of the City of London.

The elections in Common Hall cannot take place while the Lord Mayor and the Aldermen who are not candidates are present. They must leave the hall, which for the time being must be entirely in the possession of the Livery. The Lord Mayor and some of the Aldermen are for the moment disfranchised. The Sheriffs, assisted by the Recorder, conduct the election.

Another strange proceeding at the Common Hall elections is the device by which the electors know for whom they are voting.

The name of each candidate is placed on each side of an oblong slip of wood. This is drawn up by a cord to the top of a wooden pole, of such an elevation that all can see it. The Recorder calls the name of the candidate, the name is exhibited, and the electors hold up their hands.

What was the origin of this unusual proceeding? Years ago Common Halls were not conducted in the orderly, business-like manner of the present day. The noise in the hall was so great that it was impossible to hear the names announced; the Livery had to have some visible means of knowing for whom they were giving their votes.

The voting over, the Aldermen and officers proceed to inform the waiting Lord Mayor and Aldermen of the result of the election.

The procession returns to the hall, and, after further ceremonies and speeches, the Common Crier dismisses the Liverymen, bidding them return when they are again summoned. With all this quaint adherence to the customs of the past, should a poll be demanded all the past is forgotten, and the poll is taken exactly in the same way as for a parliamentary election.

III.

There are other features in the Common Hall proceedings which are interesting. Those who walk in the procession from the Aldermen's court-room to the Hustings carry a bouquet of flowers. On the floor and the table of the Hustings are placed sweet herbs, mint, thyme, camomile, rose-leaves, &c. These herbs remind us that, in the days of ignorance, the practice was considered an excellent method of disinfection and a preventive of jail-fever and other contagious diseases.

At the midsummer Common Hall, when the Lord Mayor and Aldermen have left the hall, the sword is placed on a bed of rose-leaves arranged on the officers' table in the Council Chamber. At this Common Hall the Sheriffs, the City Chamberlain, and other officers are elected. Some of these officers have now practically no duties—for example, the Ale Conners, who, in the past, had the duty of visiting systematically the City taverns and testing the quality of the ale sold. The Bridgemasters were, in the days gone by, men of importance; now they are only called upon to sign leases associated with the Bridge House Trust, and to inspect the bridges as to their cleanliness and lighting.

At the election of the Lord Mayor in Common Hall on Michaelmas Day, the Livery are only the selectors, and not the electors. Usually the two senior Aldermen are selected. The Aldermen finally decide who shall be Lord Mayor for the year ensuing. The ceremony at which this is carried out is very impressive.

The Sheriffs and officers enter the Council Chamber, in which the Lord Mayor and Aldermen are assembled. They are the bearers of the result of the proceedings in Common Hall. They make three obeisances to the Chair, first at the entrance, the second in the middle of the court, the third at the table. The Lord Mayor acknowledges each obeisance, at the third taking off his hat. The Town Clerk then proceeds to record the votes of the Lord Mayor and the Aldermen. Each Alderman whispers into the ear of the Town Clerk the name of the Alderman for whom he votes. The Recorder and the Common Serjeant look on, to see that no mistake is made in the recording.

The Sword-Bearer wears white gloves when he hands the Lord Mayor-Elect to the seat by the

side of the Lord Mayor. When the procession returns to the Hustings the Lord Mayor-Elect walks by the side of the Lord Mayor.

When all are seated on the Hustings, the Town Clerk calls upon the Lord Mayor-Elect to take upon himself the office of Lord Mayor, and the Sword-Bearer places upon him the chain he wore as Sheriff.

The Lord Mayor and the Lord Mayor-Elect proceed to the Mansion House, both in the Lord Mayor's carriage, and in the evening a dinner celebrates the happy event. As a rule the Livery accept the Alderman elected by his brethren, but if the other selected Alderman is not satisfied he can demand a poll. This is carried out in the same way as when a Member of Parliament is elected.

The Court of Aldermen possess the privilege of refusing to receive an Alderman elected by the citizens.

Sir John Bennet was three times elected by the citizens of the ward of Cheap, and three times the Aldermen refused to receive him as one of their body.

IV.

The Lord Mayor, having been elected, must now receive the sanction of the sovereign. On the first day of the Michaelmas sitting of the Law Courts, he and other members of the Court of Aldermen and officers proceed to the House of Lords to receive from the Lord Chancellor the sovereign's approval.

On this occasion cakes and hot spiced wine are handed round, the Lord Mayor's butler having previously made the accustomed delivery of wine to the butler of the Lord Chancellor.

There is yet another ceremony before the Lord Mayor-Elect can take his place as king of the City.

The ceremony of admission of the Lord Mayor into his office is held on the 8th of November. It is very quaint, its details being symbolical of the position held by the Lord Mayor. It is curious to note that when proceeding to the ceremony the Lord Mayor leaves the Mansion House by the front entrance, whereas the Lord Mayor-Elect, not being fully fledged, leaves by the side entrance.

The ceremony takes place on the floor of the banquet-hall, which is generally in a state of confusion in consequence of the preparation for the next day's banquet. Seats are arranged in a semicircle for the Lord Mayor, Aldermen, the Masters and Wardens of the companies of which the Lord Mayor and the Lord Mayor-Elect are members. When all are seated, the Common Crier walks to the table, making three low reverences on the way. He stands at the table, having the mace before him, resting on the floor. The Town Clerk, standing on the north side of the table, makes three low reverences and proceeds to read the declaration, which the Lord Mayor-Elect repeats and signs. The Lord Mayor resigns his seat to his successor, and takes his seat on the left of the new Lord Mayor.

The Common Crier now walks away with the mace, and the ceremony of acknowledging the incoming Lord Mayor's authority takes place. Those who take part in this ordeal have to exercise considerable self-control, walking a measured distance, then making a low reverence, afterwards walking backwards and performing the same action.

The Chamberlain walks to the south side of the table, making three reverences on the way, presenting the City sceptre to the outgoing Lord Mayor, who hands it to his successor, who places it on a velvet cushion. Twice again the Chamberlain goes through this ceremony, once with the seal of the office of Mayoralty, and once with the City purse. Altogether the Chamberlain has made eighteen reverences.

The Sword-Bearer with the sword, the Common Crier with the mace, go through the same performance.

By this time the velvet cushion is covered with the City's emblems. Now comes the necessity of taking all these back.

The Chamberlain's chief clerk comes forward, makes the usual reverences, and with one fell swoop takes away sceptre, seal, and purse.

The Sword-Bearer takes back the sword, the Common Crier the mace. The Lord Mayor signs certain documents, and various keys are handed to him. How soon are the mighty fallen! On the return journey to the Mansion House the incoming Lord Mayor gets into the carriage first, the outgoing Lord Mayor sitting on his left.

V.

During his year of office the Lord Mayor has to take part in many ceremonies. At the opening of the sessions at the Central Criminal Courts the Lord Mayor receives the judges at the entrance. On the first day of each session one of the Sheriffs, in his state carriage, proceeds to the Royal Courts of Justice to escort the judge to the Central Criminal Court. Bouquets and strewings of sweet herbs are provided.

The presentation of the Freedom of the City to distinguished persons gives an opportunity to the City Chamberlain to act as the Corporation's spokesman. These orations refer to the good deeds of the one who is being honoured. The Lord Mayor presides, but does not speak.

The Chamberlain's chief clerk reads the testimony of the compurgators; of these there are at least six. They testify as to the good character of the new aspirant to the City's roll of fame. This is their testimony:

'A. B., citizen, and C. D., citizen, and' (naming the others) 'declare that —— is a man of good name and fame, that he does not desire

the Freedom of the City whereby to deprive the King or the City of their rights, customs, or advantages, but that he will pay his scot, and bear his lot, and so they all say.'

The old Court of Hustings is occasionally held on the dais of the Banqueting-Hall. This is a Court of Record in which deeds are read out and recorded. The term 'hustings' is from the Icelandic *hus*, a 'house' or 'palace,' and *thing*, 'an assembly.' A Court of Hustings is a court held in a building, to distinguish it from a court held in the open air. The Lord Mayor, Aldermen, and Sheriffs are the judges; the Recorder sits with them to pronounce the judgment of the court.

The proclamations at the opening and the closing of the court are curious. After calling upon all to be uncovered, the Common Crier says:

'Oyez! Oyez! Oyez!

'All manner of persons who have been five times called by virtue of any exigent directed to the Sheriffs of London and have not surrendered their bodies to the said Sheriffs, this Court adjudges the men to be outlawed, and the women to be waved' (waved—that is, warned to move to and fro).

The closing proclamation is:

'Oyez! Oyez! Oyez!

'All manner of persons who have anything more to do at this Hustings Pleas of Land may depart hence at this time, and keep their day here again at the next Hustings Pleas of Land.'

The office of Lord Mayor of the City of London is one of great dignity. A long training is necessary for its proper fulfilment, and a full purse is also required. The Lord Mayor receives a salary of ten thousand pounds; but the demands of his office necessitate at the present day the expenditure of three times that sum.

In the City the Lord Mayor ranks next to the sovereign; on the Continent there is a most exalted opinion of his position. So long as wise, loyal, and generous-hearted men occupy the civic chair, so long will that honourable office be respected by all true citizens.

The Earl of Beaconsfield once made the following just statement on this matter:

'You, my Lord Mayor, occupy a position which is respected, not only in England, but throughout Europe. You represent the municipal priniciple, to which the civilisation of the world is so much indebted, in its most distinguished form.'

THE RED ROBBERS OF MOUTHWY.

By DAVID MACRITCHIE.

ALTHOUGH the characteristics of the Red Robbers of Mouthwy are chiefly preserved in the folk-memory of the Welsh peasantry, their existence is definitely recorded in history, and they also find a place in the *Dictionary of National Biography*. The traditional references to them are many. In his *Wild Wales* (Chap. LXXIV.) George Borrow makes mention of them thus. Addressing an old Welsh peasant, Borrow asks, '"What is become of the red-haired robbers of Mawddwy?" "Ah," said the old man, staring at me, "I see you are a Cumro. The red-haired thieves of Mawddwy! I see you are from these parts." "What's become of them?" "Oh, dead, hung. Lived long time ago; long before eagle left Tap Nyth." He spoke true,' continues Borrow. 'The red-haired banditti of Mawddwy were exterminated long before the conclusion of the sixteenth century, after having long been the terror not only of these wild regions, but of the greater part of North Wales. They were called the red-haired banditti because certain leading individuals amongst them had red, foxy hair.'

A fuller account is given by Wirt Sikes, at one time United States Consul for Wales, who, writing from Cardiff in 1879, states: 'There is a well-authenticated tradition of a race of beings who, in the middle of the sixteenth century, inhabited the wood of the Great Dark Wood (Coed y Dugoed Mawr) in Merionethshire, and who were called the Red Fairies. They lived in dens in the ground, had fiery red hair and long strong arms, and stole sheep and cattle by night. There are cottages in Cemmaes parish, near the wood of the Great Dark Wood, with scythes in the chimneys, which were put there to keep these terrible beings out. One Christmas-eve a valiant knight named Baron Owen headed a company of warriors who assailed the Red Fairies, and found them flesh and blood. The baron hung a hundred of them, but spared the women, one of whom begged hard for the life of her son. The baron refused her prayer, whereupon she opened her breast and shrieked, "This breast has nursed other sons than he, who will yet wash their hands in thy blood, Baron Owen!" Not very long thereafter, the baron was waylaid at a certain spot by the sons of the "fairy" woman, who washed their hands in his warm and reeking blood, in fulfilment of their mother's threat. And to this day that spot goes by the name of Llidiart y Barwn (the Baron's Gate); any peasant of the neighbourhood will tell you the story, as one told it to me.'

Sikes does not explain why the Welsh word for those people should be rendered in English as 'fairies'—a translation which is also given by some other writers. His general account, however, is in agreement with local tradition

and with history. 'Scythes were fixed in the chimneys of the nearest houses, to prevent the nocturnal descent of these plundering ruffians,' says a writer in the *Scots Magazine* of 1823, and he adds that 'scythes were to be seen in the chimney of a neighbouring farm-house about thirty years ago, but they have been since removed.' It appears that the statements in the *Scots Magazine* are based upon the account given by Pennant as early as 1781 in the second part of his *Tours in Wales*. I am indebted for this identification to Dr John Edward Lloyd, Professor of History in the University College of North Wales, and author of the biographical notice in the *Dictionary of National Biography*, wherein the Red Robbers are mentioned. That notice relates to Lewis Owen, who was Vice-Chamberlain of North Wales, Baron of the Exchequer of Carnarvon, Sheriff of Merioneth, and Member of Parliament for that county in the reign of Henry VIII. Professor Lloyd briefly relates the incidents attending the death of Lewis Owen in these words: 'Owen met his death at the hands of "Gwylliaid Cochion Mawddwy," the red-haired brigands of the Mawddwy district. Empowered by a commission to extirpate the band, he and John Wynn ap Maredudd of Gwydir one Christmas-eve seized over eighty of them, and in due time had them executed. The rest swore revenge, and on 11th October 1555 waylaid him near Mallwyd, as he was returning from the Montgomeryshire assizes. His retinue fled, leaving only his son-in-law, John Lloyd of Ceiswyn, to defend him, and he fell pierced with more than thirty wounds. The spot is still known as "Llidiart y Barwn," the Baron's Gate.'

Borrow's statement that the Red Robbers were exterminated in the sixteenth century is at variance not only with known facts, but also with beliefs still current in Wales. In considering the recent anthropometrical survey in Wales, Dr H. J. Fleure drew attention (in 1920) to an existing type, scarce no doubt, which manifests some of the physical characteristics attributed to the robbers. A man of this kind, who appears to have been living in 1854, is described as having 'dark, rather lank hair, a very ruddy skin, receding brow, projecting teeth, and limited intelligence.' 'This author,' observes Dr Fleure, indicating the source of the description just given, 'was not concerned with the anthropological origins of these peoples, but believed them to be descendants of the Red Robbers of Mawddwy (Gwylltiaid Cochion Mawddwy), who were expelled from their old home in the sixteenth century, and took refuge in Plynlymon district. Professor E. A. Lewis (Aberystwyth) kindly tells me that this dark type, with very ruddy cheeks, was pictured as the type of the Red Robbers on the jugs formerly in vogue around Llanidloes. The possibility of the relationship of those people to the Gwylltiaid Cochion is an interesting one,' concludes Dr Fleure; 'Mawddwy is another remote fastness of the mountains, not many miles away from Plynlymon.' It will be observed that the adjective 'red' is here applied to the skin, and not to the hair, which was dark. The Welsh adjective *coch* simply means 'red,' and does not necessarily denote red hair. Another writer, however, removes this discrepancy by describing skin and hair as both red. 'In Merionethshire,' writes Mr G. F. Scott Elliot in 1909, 'there was once a tribe of ruddy-skinned, red-haired people, with very receding brows and projecting teeth, called the "Cochian." They lived in dens and caves, and became very unpopular, for they murdered and plundered everybody in the neighbourhood.'

The south-west of Scotland, it is interesting to record, recently contained a caste whose appearance suggests some kinship with the robbers of Mouthwy. 'They had dark hair, and dark brown eyes, or occasionally dark blue,' states De Brus Trotter, who records their existence; 'their faces were narrow at the brow and chin, and very broad between the eyes; they had thin, prominent hook-noses, wide mouths with large, broad, projecting front teeth, which the upper lip could with difficulty cover, and which overlapped the lower lip; their foreheads were small, flat, and very much receding, and had three strong wrinkles, while their chins receded worse than a negro's, and were very small, and nearly all the grown women had beards, both on the chin and upper lip. Tradition says that they were the descendants of some savages they call the Kreenies, that came over from Ireland, but emigration is making them scarce.'

It is a remarkable circumstance that, although all the traditional references to the Red Robbers denote a race quite distinct from the surrounding population, the earliest written record gives no hint of racial difference. That record, to which I have been directed by Professor Lloyd, was written by Lewis Owen's great-grandson, Robert Vaughan of Hengwrt, who died in 1667. Vaughan merely introduces the robbers as 'felons and outlaweys which from y^e^ civille warres betweene Yorke and Lancaster abounded in y^e^ countrey,' and in describing the ambuscade where his ancestor fell he uses these terms: 'He was in his returne met by a damned crew of thieves & outlawes, who in the thick woods of Mouthwy lay in wayt for his coming, & had cutt downe long trees to crosse y^e^ way & hinder his passage, and being come to the place, they lett flie att him a shower of arrowes, whereof one lighted in his face, the which he took out with his hand and brake it, then they fell upon him with theire bills & iavelings [javelins] & killed him.'

To whatever race they belonged, the Red Robbers of Mouthwy were greatly dreaded.

Pennant, writing in the latter part of the eighteenth century, says of them: 'The traditions of the country respecting these banditti are still extremely strong. I was told that they were so feared that travellers did not dare to go the common road to Shrewsbury, but passed over the summits of the mountains to avoid their haunts.'

A NIGHT IN THE SUDD.

By K. L. Orde.

FAR away in the Soudan, where the White Nile runs westward from Malakal and the Egypt of desert has long since given place to the Africa of swamp and jungle, there lies, at a point some six hundred miles south of Khartoum, the wood-station of Berboi.

The queer, top-heavy-looking paddle-steamers, which, with their attendant barges attached to front and sides, ply to and fro from Khartoum to Rejafe, burn wood, not coal. And as the trip takes thirteen days if one is lucky, and anything up to twenty if one is not—which is usually the case—they consume a good deal more wood than can be carried on the steamer itself or on the barges: hence wood-stations at varying intervals, where, with much chatter and a complete ignoring of any such mundane factor as time, a fresh load is taken on board, and the boat, after a few preliminary collisions with the bank, once more gets under way, and continues, barring intervals for getting off sandbanks or retrieving errant barges, its slow course up the river until it is time to repeat the process some distance farther on.

Now the powers who control the destiny of these wood-stations appear always to choose the most unlikely spots. 'Here,' one can imagine them saying, 'is your wood, stacked and ready for loading. But you've got to work for it;' so that, while the local wood-cutter and his ass may bless the authority which has placed them within easy reach of his hut and the jungle, the impatient traveller who sees his boat forced to puff slowly up some tortuous backwater—preferably at night, so as to give the mosquitoes a chance—or steer laboriously round some jutting sandbank, is apt to curse the powers, the wood-stations, even the unoffending boat itself; especially if he cherishes that desire, so incomprehensible in the East, of getting to a certain place in a certain time. And, where all are difficult of approach, Berboi is practically inaccessible.

On the left bank is Tonga, a large village with mission-station and chapel complete, where the boat has to stop anyhow for trading purposes. An ideal spot for loading wood? No; too easy. On the other bank there is no village, and about two miles of sudd intervene between it and the narrow navigable channel that runs past Tonga. So, a year or so ago, some optimist placed a wood-station there, cut a channel through the sudd, and went away; or, more probably, he never actually came to the spot at all, but worked it all out on a large scale map in Khartoum; for, officially, the sudd does not commence till the river bends south again at Lake No.

Now sudd, for the benefit of those who have never had the misfortune to see it, consists of papyrus grass and reeds growing in the water, and at the beginning, where papyrus is in the minority, is not unlike a reed-bed in England—on a somewhat larger scale. Take the biggest reed-bed you know at home, multiply the height and the depth of the reeds by three, and the extent of the bed by anything up to fifty, increase its consistency a hundredfold, dot it with clumps of papyrus of varying extent, populate it with thousands of frogs and millions of mosquitoes, and you will get some idea what the sudd looks like. At Tonga the Nile is perhaps three miles across, of which two-and-a-half miles are sudd. Farther south it broadens out, till it really becomes an elongated lake three hundred miles long, and in places more than fifty miles broad from bank to bank; a lake, not of water, except for one narrow channel and an odd pool or two, but of floating vegetation, papyrus (looking, with its slender stem and fluffy head, not unlike an enormous dandelion clock coloured green), and gigantic reeds. Such is the sudd. It is no respecter of persons; it baffled the Pharaohs; it checked the southward march of Rome; for generations it laid the seal of mystery upon the upper reaches of the Nile; and, snapping its myriad fingers at the gentleman who made the wood-station a year or so ago, it slowly and deliberately closed up his passage.

Then our boat came along. We had to have wood to take us up the three-hundred-mile passage to Shambe, throughout which the sudd is so wide that no wood-station is conceivable; and we had taken all there was at previous wood-stations. So we left one barge at Tonga, to be retrieved again after loading, and, late in the evening, nosed calmly into the channel. For a mile or so all went well; then we came up against a wall of sudd. It was only about three hundred yards across, with an open pool in the centre and a wide lake beyond lying under the bank, where burned the solitary light of the wood-station, a glimmering materialisation of the proverb, 'so near, and yet so far.' Indeed, it looked easy enough as, with a barge each side, we advanced boldly into the green mass; but the aspect changed when the boat was brought

to a full stop within five yards. Even then we amateurs talked glibly of being through in half-an-hour; but the Egyptian *reis* in charge of navigation and the English engineer knew better. They took counsel together, and effected a strategic retirement into clear water, where they unhooked the barges before returning to the charge with the steamer alone.

This was about nine o'clock. It had rained heavily during the afternoon, and the sky was still overcast; but the moon, nearly at its full, behind the clouds, and almost continuous lightning, playing along the horizon both to right and left, threw a pale and gloomy light over one of the most desolate scenes imaginable. Tonga had vanished into the gloom; the two barges, lying low on the water, were hidden behind the tall papyrus; we appeared to be alone on an illimitable sea of sodden vegetation, the most impassable, useless thing on earth. Man can find a path across the desert; he can fight his way over everlasting ice; but no man and no four-footed beast can cross the sudd, save where infinite labour clears and keeps clear a narrow, twisting passage for the boats. It will grow nothing but itself; it will breed nothing but the frog, the firefly, and the mosquito; it will remain nothing but sheer waste; it is nature's ultimate stronghold, inviolate and inviolable. And at this hour, exactly a month before, we had been finishing dinner in a big London restaurant. There, lights, crowds, and all the roar of London; here, silence and desolation. If half the lure of travel in these days of quick transport depends on contrast, it would be hard to find a more piquant one than this—Piccadilly and the sudd.

The paddles behind thrash furiously, the helmsman pulls madly at the wheel, and once more we push our square prow—about the worst possible cutting instrument in the world, one would think; but, then, its real mission in life is to push barges—into the clinging green mass. Not much headway that time. Back her out, and try again in another place. That's better. We must have made nearly ten yards this time. An unknown bird mocks at us out of the darkness, and the lightning plays derisively along the horizon, while the bull-frogs chant their monotonous chorus, 'This is our kingdom. Get out! Get out! Get out!'

We backed out and pushed in, backed out and pushed in again, each time in a slightly different place, the idea being apparently to cut off wedges and let them drift away on the sluggish current. For an hour or more this went on with no appreciable effect; then, quite suddenly, great cracks appeared along the dark-green surface, exactly like the cracks that appear on ice when the thaw first sets in. Large masses detached themselves and drifted reluctantly away. Progress became easier, but not easy, and it was not till eleven o'clock that we reached the small, open pool half-way to our goal.

All this time we had been watching from the high upper-deck, fifteen feet above the water, which not only held the bridge and the mosquito-proof shelter where we slept when the rain permitted, but also served as a much-needed, if somewhat restricted, recreation-ground. Now three out of the six passengers, including the vivacious little Belgian lady going to the Congo, who served to break the mere male monotony of the ship, and also as a most charitable darner of socks, gave up in despair and retired. But for us the fascination of watching this grim struggle was too strong; and, instead of going to bed, we went down, as it were, to the very forefront of the battle, to stand on the flat bow only a foot above the water's level, a view-point from which the task appeared colossal, a dense wall of dark-green rising in places as high as eight feet out of the water and going down Heaven knows how far beneath, ragged-topped and solid-fronted, a veritable phalanx of vegetation. The paddles thrashed again, and the boat drove forward, reminding one vaguely of a tank ploughing through wire. The great reeds flattened and parted before it with a curiously sinister hissing sound which seemed to hold a world of malevolent opposition. 'You shall not pass!' they hissed; and the boat slowed down, panted, and stopped dead. Engines reversed, we backed out again, while the reeds righted themselves triumphantly before us, and the whole programme was gone through once more.

Now muscle came to the help of steam. Native sailors standing by us on the front threw in a great four-pronged anchor, which for all its weight barely sank at all, slackening the rope as we retreated, hauling at it as we advanced, to a native chanty which harmonised well with the weirdness of our surroundings, and, ever and anon, pulling it on board to free it from its load of clinging weeds. Others pushed at the flattened mass with long poles and an enthusiasm which did them credit, but which unfortunately was of little visible assistance to the work in hand; while we watched spell-bound, forgetful of mosquitoes, conscious only of a queer desire to jump into that sagging greenery to see if it would bear—a temptation which we nobly resisted. And all the time the paddles thrashed and the *reis* shouted, the frogs croaked, and the fireflies danced, and we pushed and backed and pushed again, till the channel behind became covered with floating débris of battle.

Now there is only about ten yards between us and the lake, but it is the highest, most solid-looking mass yet encountered, and we cannot back out far for fear of fouling the paddles in the detached masses of sudd floating round behind. Still, have at it! Now it's moving; she'll never get through that high wall. It looks less solid to the right there; bring her

head round and try again! We 're through it this time. No, not quite, but the stuff is parting. There 's a ribbon of clear water showing through. One more push! Push hard. We 're through! And, as though to celebrate our triumph, a pale watery moon comes out from behind the clouds that have hidden her all the evening.

I think each of us was conscious of a queer sense of almost personal triumph, as though we had taken an actual hand in parting the reeds and dragging up the roots, and of a feeling of affection for the ugly little steamer we had cursed so frequently for a week past. Late she might be; leak she undoubtedly did; but when the crisis came she put up a gallant fight (where many of her more graceful, comfortable sisters would have retired after the first onset)—and won.

However, the battle was not over even yet. In her final charge she had driven a mass of detached sudd in front of her, which now lay at the mouth of the channel leading into the lake. This mass had been pushed and beaten until it had become almost as solid as a rock, though with clinging, clogging propensities to which no self-respecting rock would own. It, too, put up a gallant fight, like a forlorn hope which, when the rest of the defence lies in ruins about it, is determined to go down fighting rather than surrender. In this case it did go down fighting —literally; but not till we had spent a long quarter of an hour trying to get round first this side, then that, in such a way as neither to leave the channel blocked nor get our paddles fouled behind; and then, at last, we were in clear water, having taken just over four-and-a-half hours to do three hundred yards.

The rest is soon told. We steamed back through the hard-won passage, not without some slight opposition from the floating masses detached earlier in the evening, so that all night long one heard through dreams the angry hiss of the baffled reeds, and, having picked up the patient barges, steamed for the third time along that fatal channel to our dearly purchased wood. But it was not till eleven next morning that we got back to Tonga.

To go south from Khartoum by Nile steamer is a lesson in patience which I personally am never likely to repeat. But I should dearly like to know how soon they will place another wood-station at Berboi.

THE PARTNERS.

PART II.

IV.

DURING the next month Graham was constantly away from the office, and callers had to be content with seeing Miss Roberts. There was no one else who had the official details of the business so much at his fingers' ends. Watson, in his keenness about the work, forgot his dislike of going to the office, and on several occasions found himself discussing business with the secretary. Possibly he did not change his opinion concerning good-looking women, but he certainly did appreciate her capabilities.

Graham found them in his room together when he turned up at the office unexpectedly one afternoon. Watson was seated, poring over some sheets of typewritten figures; she was standing beside him, evidently to explain items he did not understand. Watson sprang to his feet as Graham entered.

'Pardon, sir. I was just studying these figures, and Miss Roberts——'

'That 's all right, Watson;' and Graham smiled at his partner's quickness to play the foreman. 'I shall be ready to go into things with you, Miss Roberts, in a few minutes.'

'She 's a nice girl that, and no fool,' Watson said when the secretary had gone.

'I thought you had got the idea that I was placing too much confidence in her,' Graham remarked.

'No. Well, if I had, I have changed my mind.'

He stood leaning over the desk examining the sheets of figures as Graham glanced at him, wondering if the girl appealed to his heart, whether Watson had become conscious of the loneliness of his existence, and had contemplated the possibility of winning love and happiness. Such a rivalry was not a very pleasant speculation. On his own showing, Watson had the habit of quick settlement with men who stood in his way. He had got into the habit of carrying an automatic. Some circumstance must have given him the habit; possibly in the past, in some wild episode in his life, he had had occasion to use such a weapon. Watson might have killed his man—perhaps that was why he preferred to remain a hidden partner.

'She is very capable,' Graham said slowly; and then, deciding that it was best to be absolutely above-board, he went on: 'She is quite out of the ordinary run, Watson, and I am thinking of asking her to marry me.'

'You might do worse,' Watson answered without looking up.

'At present our relations are only business ones, but——'

'Better wait until we have got this work in going order,' Watson interrupted. 'You can't afford to have divided interests just now. Of course, she must never know of our partner-

ship. That remains a secret even from your wife.'

'Of course. You don't see anything to object to in such a marriage?'

'Quite the opposite. I admire your sense. You might be wanting to tie a feather-headed fool round your neck, and that might have ruined you—and me too, perhaps. This girl will help a man. She 's clever, discreet. Wonder what her people are?'

'Don't know, and I don't care,' answered Graham, relieved at the manner in which Watson had taken the idea of such a marriage. 'I am not going to marry her people.'

Talking of the girl made Graham suddenly remember the man who had called and would not leave his name.

'By the way, Watson, there is something I have been meaning to ask you for some time, and I have always forgotten it. The day I clinched this contract, the day I was at Portsmouth, somebody called and asked Miss Roberts whether we had any one of the name of Vallence connected with the firm. Is there a hand of that name?'

'Vallence!' and Watson placed his finger on the papers to mark the point in the calculations which he was considering. 'Vallence! No, there is no workman of that name. Who asked?'

'The man wouldn't leave his name.'

'Some try-on, Graham. Perhaps a newspaper move. They may have got hold of the fact that this contract had been given us, and—Vallence! It 's an uncommon name, and recalls something to my mind. Doesn't it to yours?'

'No. I never heard it before. If there is nothing in those figures you want to talk to me about, I 'll have Miss Roberts in and get on with my work. I must go up north by the night-train.'

'The factory will be working at full pressure by Monday week,' said Watson, taking up his hat, 'and you can make what promises of delivery you like. I have let Mills into this as under-foreman. He is a good fellow, and knows his job. Shouldn't wonder if I wanted a holiday as soon as the work begins to run quite smoothly, and I want to have some one at the factory I can leave in charge.'

V

Richard Graham went north that night, and was away for ten days doing his part to make the wheels of R. Graham & Co. run smoothly. He returned to town late one afternoon, and that evening went to the theatre. He felt he had earned a little recreation after ten days of such strenuous work. The evening was very warm, the theatre exceedingly hot, and in the foyer between the acts he met a lady and her daughter whom he knew, and the next moment found himself face to face with Miss Roberts as well. She was with them, and even as they looked at each other the lady turned to Graham: 'Let me introduce my daughter's great friend, Miss Vallence.'

Neither of them spoke. Their eyes met, they bowed gravely, and then Graham fell into step beside the elderly woman, and remained with her until they returned to their seats.

So her name was Vallence, not Roberts. Even if she chose to be known as Roberts in business, why had she not explained when she told him of the stranger who had called asking if any one of that name were connected with the firm? She was connected with it. What was the mystery? Why had she mentioned this caller at all? And then he remembered that Watson had connected the name with something in the past. Could there be some disgraceful story behind her? Hardly, since in private life she was known as Vallence. Her hostess did not know her by any other name apparently, and it was quite evident that she did not know the girl was connected with him in business.

Graham spent most of the night in speculation, and went to the office next morning still speculating, wondering whether his secretary would turn up, or whether he would find a message from her excusing herself from resuming her duties.

She came into his room almost at once. He did not see her in her neat office-dress—he was thinking of her as she had been last night. His astonishment at the introduction had not prevented him from noticing how beautiful she looked.

'Good-morning, Miss—Miss Vallence,' he said.

'Of course I must explain, Mr Graham. It is not a very pleasant confession I have to make.'

'There is nothing criminal in calling yourself Roberts for business purposes,' he said, with a smile; 'but when that stranger——'

'Nobody ever called to ask about Vallence,' she said. 'That was a trap. I wanted to see if the sudden mention of the name would startle you. It didn't.'

'I had never heard it before,' said Graham.

'I was convinced of that,' she answered, 'but others were not so easily satisfied.'

'Others!'

'It is rather a sordid story,' she went on, 'and I have regretted that I ever consented to play a part in it. My excuse is, that I was so intimately concerned in it. My introduction to you was obtained for me by Mr Selby of Dixon's. Mr Selby is my uncle, my mother's brother, and I came here to spy on you. It sounds mean, but you may think less hardly of me when I have told you all.'

'I feel so innocent that I am not likely to be hard,' Graham said encouragingly · 'and if you

came to spy, you certainly have remained to be of great service to me.'

'It is good of you to say so, and I have been exceedingly happy here. I do not remember either my father or my mother, Mr Graham. My mother may have been foolish, but unless everything her brother, John Selby, says is untrue, she had great provocation. My father was the kind of man who never ought to have been married; he did not know how to treat a woman. He was selfish, self-centred, altogether without those little considerations and endearments which mean so much to a woman, which a wife expects. My mother was very ill at the time of my birth, and afterwards, finding no love and sympathy in my father, who was absorbed with his own affairs, she turned for consolation to a cousin of hers. They had always been very much attached to each other, and I do not believe any real harm was intended; but my father found them together, chose to believe the worst, and, without asking questions or giving them time for any explanation, shot them both.'

'Killed them!' Graham exclaimed.

'Both of them in his mad jealousy, and made good his escape. From that day to this no one has heard of him. I do not know whether he is dead or alive. My uncle did everything he could at the time to trace him and bring him to justice, even when the police efforts relaxed, and he has never let go the idea that some day it would be in his power to avenge his sister—my mother.'

Graham was silent, thoughtfully drawing patterns on the blotting-pad.

'When your firm started,' the girl went on, 'my uncle was convinced that you must know something of my father. The patents were so like the ideas my father had always been keen about. I think my uncle once spoke to you about them. It was to watch you that I applied for the post here. My uncle got me out of my last place for that purpose. I have always worked for my living; I could not bear to be dependent, although it is only fair to say that my uncle offered me a home. I have an idea that the foreman, Watson, has suspected that I am an impostor. I suppose that is why I do not like him.'

'But lately I thought——'

'Oh yes, we have both been so keen about the new business that we have forgotten our likes and dislikes for the time being.'

'We must talk over this again,' said Graham, after a pause. 'Perhaps you will give me an opportunity of doing so out of business-hours. Would you mind dining with me somewhere to-night? I have a great deal to say, something even to confess. Will you do me this favour?'

'Yes,' she said, after a moment's hesitation.

'Thank you. Shall we get on to business now? I must go down to the factory at half-past twelve. You shall be Miss Roberts until this evening.'

VI.

Watson, in his shirt-sleeves, was eating his lunch in his small office off the factory when Graham entered.

'Hallo! What brings you here?'

'Miss Vallence.'

'Miss——'

'Roberts is a false name; her real name is Vallence. John Selby of Dixon's is her uncle, and she was sent to the firm to spy upon me.'

'Well?'

'Quite by chance I met her last night, and was introduced to her in her real name. Naturally she explained this morning. There was nothing else for her to do. She told me her story. She is dining with me to-night. I thought you ought to know.'

'Are you going to ask her to marry you?'

'I am unless——'

'Unless what?'

'We are partners. I recognise that you have a voice in the matter.'

'I suppose you want to tell her about me,' Watson said, after a few moments' silence.

'No. I thought you might like to talk to her about her father.'

'Well, why not?' said Watson vehemently. 'There is a lot of her father in her. She would probably understand him better than most people would. Yes, I will see her if you like.'

'When?'

'Not to-morrow—I am too busy to-morrow; the next day. Bring her down here. I am more myself in the factory than I am at the office.'

'Very well, I will bring her here,' said Graham, and then he put his hand on Watson's shoulder. 'Partner, I think that is the right decision. Unless I am very much mistaken, she is to be trusted. No one else need ever know.'

'That seems all right, Graham. If you have luck to-night, there will be three partners in the business, and Selby can—oh, well, he's a Selby, and one must make allowances.'

VII.

It was a wonderful evening for Richard Graham, and the next day business took a second place in his mind, and in the girl's too, for that matter. She had not promised to marry him, but she had not refused. She would tell him, she said, after she had heard what Watson, the foreman, could tell her about her father.

They were certainly more than employer and secretary when they went to the factory together to see Watson. Mills came to them and handed Graham a letter.

'Mr Watson left it for you yesterday, sir, and said it was to be given to you when you came.'

'Isn't he here, then?'

'He hasn't arrived yet, sir.'

Graham took the girl into the small office, and closed the door. He tore open the envelope. It only contained another addressed to Miss Vallence. She took it, and read the letter aloud:

'"DEAR BEATRICE,—There is very little new that I can tell you about your father. He has been wandering about the earth for a good many years, not so unhappy as you might suppose. The time came when he was sick for the sight of England again, wanted to work in England, and, yes, wanted to get a sight of you if possible. Well, I came, tumbled upon a good fellow, took him into partnership without telling him anything about the past, and, working it as I did, I felt pretty safe. I didn't make much inquiry for you. The old neighbourhood knew nothing of you, and I felt that too much eagerness might be dangerous. I did not know you when I first saw you at the office; afterwards I did. It might continue to be safe for me in England if you could keep a still tongue, but could you? I am only the father you have learnt to hate, and deep down in your heart there is the thought of your mother, and what happened. I funk the issue of that struggle in you, and I couldn't stand being locked up at my time of life, even if they didn't hang me. So I am off to the wilds again, and I shall never come back. You had better just wipe me out of your memory altogether. Good luck to you. You are worth more than most women I have known. Tell Dick Graham that I have saved enough for my wants. I am out of the business, and he is free to take another partner.—Your FATHER."'

'Had you guessed he was your father?' Graham asked when she had finished reading.

'Not until you told me about the partnership, at dinner the night before last.'

Just then there were loud voices in the factory, and Mills came in.

'Please, sir, there are some men——'

'The police, Graham,' said Selby, as he came in. 'We want Vallence.'

Graham turned sharply to the girl. 'Then, after all, you betrayed——'

'Dick!'

'No, she didn't,' said Selby. 'I saw you dining together the other night, guessed there was some compact between you, thought that Beatrice had gone over to the enemy, and have been on the watch. I've always been certain that Vallence had some hand in your patents, Graham, but I never thought he would have the nerve to be in your factory. Where is he?'

'You can read that letter, uncle.'

Selby took it and read it. 'Gone!' he exclaimed. 'Got at least twenty-four hours' start.'

'And I am glad,' said the girl.

'Glad! When your mother—— I'll move heaven and earth to catch him. You must be dead to all sense of right and wrong, Beatrice. I will never let go the hope of bringing him to justice;' and he flung out of the office and out of the factory.

'Will he succeed?' asked the girl in a whisper.

'No. Your father has managed to keep free all those years; he will manage to do so still. One thing is certain: were he forced into a corner, he would never let them take him.'

'I am glad he went,' she said, after a pause; 'glad he left this letter instead of waiting, for his own sake and for mine. I wonder if I should have been able to say nothing. I doubt it. A mother means such a lot, even when you have never known her.'

'I think I understand, dear. Are you going to let me try to fill some of the blank there is in your life, Beatrice?'

'I called you Dick just now, and it seemed to come quite naturally, so I——'

'Then there are still going to be two partners in the firm,' he said, and kissed her.

THE END.

A DESERTED HOUSE.

By Lady MARGARET SACKVILLE.

THE house is deserted: not deserted so much in the literal sense, but with a voluntary withdrawing, a conscious isolation. It has belonged to the same family for so long, become so imbued with their spirit, that the introduction of strangers, however temporarily, seems an outrage. Like a faithful dog, it appears always to be waiting the return of its masters. Intruders who break for a little upon its long brooding as soon as they depart are instantly forgotten. Silence, like a heavy curtain lifted by some inquisitive hand, falls back, and all is as before. It is a solitude hardly peopled with memories even—no ghost of great events wanders here. The past has been placid, domestic, dull, and contented. It is for a renewal of this life the house is waiting; excitement, tragedy, is alien to its atmosphere. Yet tragedy has touched it and left it forlorn—giving it a suggestion of something added to its atmosphere which cannot be assimilated, or even understood.

An ugly building—about a century old—it belongs to that bad period when houses seemed the embodiment of an old-fashioned Sunday. Yet, although the idea it stands for is dreary and depressing, it is better than that pert tawdriness of much present-day architecture, which is merely ill-breeding expressed in building materials. This

house, at least, is self-respecting and without pretension. Age will not give it beauty or charm to strangers, but will endear it more and more to its own people. It is a house which, unlovable in itself, has yet been dearly loved. Every corner, every room, has its own significance. For houses which have belonged for any time to the same family acquire an evenness of atmosphere, a distinction which is impossible to those whose owners are constantly changing. A house is only superficially a place to feed and sleep in; it is essentially an, at first, unconscious organism which gradually develops a sort of obscure life of its own through the accumulated lives of all its owners. In the end it sums up, as it were, the thoughts of those who have dwelt in it—the walls are so saturated with many moods, they grow almost articulate. Walls have ears; they do not forget. So with this house. Since its beginning the thoughts and the affections of one family, very much bound together, have centred on it, and its ugliness has acquired a touching quality which lingers like faint warmth in the unused rooms. Were it inhabited by its rightful occupants it might seem merely comfortable and commonplace, but empty, or in the hands of strangers, it is full of an odd pathos. Not the pathos which envelops certain beautiful old houses with a delicate and gracious distinction, but the appeal made by an ugly and solitary child deprived of the one person who gave it sympathy. It leaves the impression of a tree in winter, waiting patiently, but without much hope, for long-delaying spring.

The surrounding country emphasises its loneliness, though in a freer mood. Here is beauty, here romance! A happy mingling of the wild Scottish romance with the English softness. A rolling, wooded, green, solitary country, with all bleak edges smoothed away—a country full of legend and history, which still remembers its traditions. Glamour lies upon it—a sort of timeless calm, so that a hundred years here might pass as one day.

There is glamour, too, about the garden. It is as though the imprisoned spirit of the house had escaped and taken holiday. For melancholy here is joined to an elusive beauty. High trees surround it and press in upon the house, jealously, protectively—as though they feared it might awake should the sun shine too fiercely on its windows. These form themselves on one side into an elm walk, a place of gray-green gloom overarched at sunset with a mist of green fire. Shimmering and shadowy, they lead to the lake—a lake of enchantment—weed-bound, reflecting the banked-up magnificent and melancholy trees which surround it, as though reflecting a dream. This disquieting solitude holds a secret it cannot share with the grimly practical house, which yet understands without sharing. The flower-garden, too, holds glamour. It is entered through a sort of temple cut from yews—yews which, though in reality not old, yet give an impression of incalculable age. The garden itself, surrounded by a warm brick wall, slopes downhill till closed in farther on by still more trees. Truly the trees are greedy for this place! They invade, close in upon it at every turn. They have their own way so completely that they seem almost conscious of their power. As in the glen—strangest spot of all—a tiny glen, dark at midday, with a fierce, small waterfall at one end, and a tearing stream running furiously into the bright fields outside. So overshadowed, so ominous, is it that even the most unimaginative feel in it the suggestion of something sinister. Here the secret of the place (which the house knows only imperfectly) comes so near the surface that it inspires terror. The trees grow strangely from the lower bank like thin, straight wands, which reflect upon the stream in lines of shade and bright light. It is the atmosphere of *Kubla Khan*—the 'deep, romantic chasm'—the scenery of imagination. And the spell which the whole place lays on the imagination binds closely, cannot be forgotten. It will last until the trees, fearing desecration by strangers who cannot understand, close in upon house and garden like a tide and leave nothing more, save, perhaps, some day a grove of yew-trees and a few stones, come upon unexpectedly in the middle of a deep wood.

HOME-SICKNESS.

THE skies are blue in Italy,
The swifts swing high o'er Rome,
And sweetly sound the anthems
Beneath St Peter's dome.
The marble and the porphyry,
The pictures and the gold,
Are rich and rare and passing fair,
But, oh, my heart is cold!

The sun shines hot in Italy,
Figs ripen on the wall,
Full many a statued cloister
Dead pagan days recall;
Vines cluster round Amalfi,
A thousand fountains play,
And passion-flow'rs beguile the hours,
But, oh, my heart is wae!

And nights are clear in Naples,
Star-spangled is the sky,
Above looms gaunt Vesuvius,
A menace ever nigh;
Hard by spreads mute Pompeii,
With frescoes scratched and worn,
On Capri's isle the moonbeams smile—
And yet my heart is thrawn.

For north away is Scotland,
With gray and misty skies;
There, far across the Border,
My wave-washed kingdom lies,
Where swan-folk feed in winter,
Where plover mate in spring,
And summer gilds the harvest
'Gainst autumn's winnowing.

NAPOLEON PASSES.

By Beatrice Heron-Maxwell.

I.

ONE of the smaller state-rooms in the king's palace at Berlin was brilliantly alight with the soft glow of many wax-candles, set in gilt sconces and candelabra everywhere, reflected in mirrors and in the polished floor. Beautiful paintings and upholstery of crimson velvet and gold, together with inlaid cabinets against the wall holding valuable china, made the room seem warmer and more home-like than some of the large, stately *salons*, and for this reason: Napoleon, Emperor of the French and conqueror of the Prussian capital, had chosen it as his private reception-room, where he held small audiences on occasions other than State ones.

It was the last of his own personal suite of apartments, and leading from it were his study, his bedroom, and his dressing-room, with a private winding stairway strictly reserved to his own use. As he entered it on this particular November evening in the early eighteen hundreds, a little group of people already waiting for him dispersed, leaving space in the centre of the room for him and the two men accompanying him.

The Emperor was in one of his most didactic moods, and, with a brief glance and salute to the others, he passed on to the far end of the *salon*, still talking earnestly to Duroc, his Grand Marshal, and General Savary, Director of the Secret Police.

The group, in deference to his well-known wish, resumed their conversation in voices sufficiently loud to show that they were not listening to his emphatic sentences spoken *à mi-voix*. For, unless he was deliberately talking to the general company, Napoleon had a great objection to being overheard.

A young and exceedingly attractive woman who had been chatting with the others now drew her husband aside, and said, with a glance towards the Emperor, 'I feel afraid of him. How abrupt he is—yet how dominating!'

Prince Hatzfeld gave her a chiding glance. 'Afraid!' he echoed. 'You will certainly fail to please him if you show fear. He admires women, and they can venture things with him that men would not dare. You must be spirited, even in your deference, or he will dismiss you with a curt word or two.'

The Princess's colour rose and her eyes were wistful. 'I would like to show him that I am grateful for all he has done for you, dearest—but it will be difficult if he discourages me.'

Her husband glanced towards the Emperor, who was standing now with his back to the room, discoursing to Savary. 'You must refuse to be discouraged,' he said impatiently. 'Make yourself pleasant to him the instant I present you. He has a weakness for your sex—it is well known.'

'I have heard, on the contrary, that he adores his Empress, and that Joséphine has a peculiar charm which men are very sensible of. Besides, I would not appeal to him in that way, even if I could. It might give him the idea that I was not altogether loyal to you—as I am, you know well.'

The Prince made an impatient exclamation. 'It is your duty,' he said, 'to think of me and of your country. He is our conqueror. We desire consideration from him for our compatriots. He must be appeased. The surest way to success with him is through a woman's beauty. And you are beautiful, little one, as you know. For my sake make yourself as charming to Napoleon as you did to me when first we met. You were not afraid of me—eh?'

'No—because I loved you at first sight.'

Her charming eyes, radiant with pride and love, smiled into his, for these were early days, and they had scarcely lost sight of their honeymoon yet.

'Then, if you love me still——'

'But of course!' she broke in with subdued vehemence. 'What are you saying?'

'Since you love me still,' amended the Prince, 'make up your mind to charm the Corsican. It will be easy for you to withdraw when you have gained his promise for certain concessions. Your country demands it of you.'

She was silent for a moment. Then her eyes lighted up, for, woman-like, she found the idea of making a sacrifice for her people attractive, and she said, 'Yes, I will try to please him—the little Emperor!'

And at this instant she met his eyes, bent full upon her face, and blushed, for they seemed to be reading the words upon her lips.

Napoleon had paused in his talk, and looked

 [*All Rights Reserved.*]

round towards Prince Hatzfeld, his quick glance passing on to the young wife, whose well-poised head and round white throat, set on a pair of exquisite shoulders, caught his admiration.

However, he turned his back again, and continued his conversation. 'You warn me of what I have already anticipated and taken precautions against,' he said brusquely to Savary. 'It was to provide for this contingency, which I foresaw, that I placed the post-offices under the control of my special police—which means under your control, my friend. See that you take full advantage of it.'

'I am exercising the most careful supervision,' Savary answered, 'and yet, sire, I cannot trace the spy. But there certainly is one. The letter, guarded as it was, that referred to the number and disposition of your Majesty's forces was written by some one in possession of accurate knowledge—some one who is attached to the person of King Frederick William. It was an answer to some communication from Berlin, signed only by initials, and addressed to initials at the Municipal Guards Club. We resealed the letter carefully, so that no one could detect that it had been opened. Yet it is still in the club letter-rack. No one has claimed it.'

'Would you care,' asked Napoleon grimly, 'to know the name of the traitor in our camp?'

Savary looked a question in reply.

The Emperor went to a writing-table, and taking a pen and a piece of paper, wrote down a word, then folded the paper and placed it in an envelope, which he sealed. 'The name is there,' he said, as he handed the envelope to Savary. 'When you have found the spy, open and read!'

Savary bowed, perplexed and chagrined.

Only a month had passed since Napoleon made his triumphant entry through the gate of Charlottenburg into Berlin, with the Imperial Guard as escort, and during that period he had been busy with the administration of his new empire, the organisation of his government, and the arrangement of his forces.

He had already promulgated the Berlin Decree, in which orders were issued to all peoples and nations under the Imperial Government, or allied with France, to enforce the Continental blockade, prohibiting all commercial intercourse with Britain, her Allies, and colonies. Yet he had apparently found time and means to ascertain who the traitor at Berlin was, while Savary, with all his ingenuity and the secret agencies at his command, was still in ignorance. It was like the Emperor. If he noticed inefficiency on the part of a Minister or an official, he did the task himself, in order to convey at once a rebuke and a lesson.

Savary knit his brows in thought, and the Emperor, with the cleft at the corner of his lips deepening in a smile, ironical but kindly, said, 'Speeches pass away, but acts remain! You are silent, Savary. I shall expect some decisive action from you before the next twenty-four hours are over.' And turning to Duroc, he added, 'Marshal, I think you know the Princess Hatzfeld, do you not? Is that she who is with the Prince?'

'Yes, sire. They have not been married more than a few months.'

'And she was——?'

'Daughter of the Minister Schulenbourg.'

'Who hates France—is it not so?'

'He has that reputation, sire.'

'Tell the Prince I desire to speak to him. He will doubtless present his wife to me.'

II.

Duroc crossed the room to Hatzfeld and delivered the message. The Prince signed to the Princess to follow him, at a short distance, and hastened to Napoleon.

'All goes well with the town, Governor?' inquired the Emperor; for one of his first appointments had been that of Hatzfeld to the civil governorship of the capital, where lately he had served his king, Frederick William of Prussia.

Napoleon had formed a municipal guard of sixty members, together with two thousand of the richest burgesses, to assist in maintaining order and discipline in Berlin, and had nominated the Prince head of the guard, in addition to his other post.

'All goes well,' replied the Prince.

'I am going to review a division to-morrow,' said Napoleon, 'and shall be away for some hours. But I count on tranquillity under your rule during my absence.'

'You can rely on me,' replied the Prince with assurance, adding, 'May I be permitted the honour of presenting my wife to your Majesty?'

'I shall be pleased to make the Princess's acquaintance.'

The Princess advanced and took the hand extended to her by Napoleon. He detained her fingers an instant longer than formality prescribed, and his keen eyes searched her face while he did so.

The Princess's fingers fluttered a little in the firm, close clasp, and her eyelashes bashfully veiled the confusion in her eyes.

'You are wearing a red ribbon, madame,' he said. 'It is an antagonistic colour to me—the colour of England!'

She looked up, smiling, as he released her hand. 'The ribbon came from your own Paris,' she said; 'but if your Majesty asks, I can take it off.'

'I do not ask,' he retorted. 'I command, or I am silent.'

'Then I will take a woman's privilege,' she answered gently, 'and grant what is unasked.' She untied the knot and drew the ribbon from its place.

Duroc and Hatzfeld retreated a pace or two, talking together, for they realised that Napoleon was interested.

'You are right, madame,' he said. 'A woman is never so charming as when she gives something without demanding anything in return—for love, in fact.'

'It is a woman's province,' she replied, 'just as war—in which everything has to be paid for—is a man's!'

He looked at her intently for a moment. Was she really ingenuous, or had she some deep and crafty meaning in this remark?

'War and love,' he said at last, 'the two great forces—which combine sometimes. The only victory possible for a man, in love's warfare, is flight. And even then he is flying from his health and happiness, for there is neither without woman.'

'Your Majesty is too great a conqueror himself,' the Princess said, 'to grudge conquest to us poor women, I am sure.'

'I not only do not grudge it,' he said, 'but I assist it. I ask no quarter.'

She made a little murmur of dissent.

'You doubt it?' he asked.

'I must not contradict you, sire,' she answered demurely.

'I am never angry when contradicted,' he said; 'I ask to be enlightened. What makes you think that it would not be easy to capture me?'

'Instinct, I suppose,' she admitted; 'or, rather, intuition. It is the feminine of reason, as your Majesty knows.' She was fencing with him, lightly and tactfully, with just sufficient coquetry to attract him.

The Emperor took the red ribbon with which her fingers were toying. 'Shall this be a gage between us,' he demanded, 'a signal that your intuition is at fault?'

The Princess did not answer. A faint colour dyed her cheeks, for Napoleon spoke with meaning, and she understood that the little bout of flirtation between them was becoming more serious.

'Shall I take silence as consent?' he asked insistently, though in a lower voice.

She glanced at him with embarrassment.

'You see me,' he continued, 'practically disarmed and at your mercy. I do not fight where I am sure of defeat. I abandoned my artillery at Mantua because I had only thirty thousand men, and there were a hundred thousand against me. You are too strong for me, madame. I know it in advance.'

She tried to smile and regain the easy lightness of their first conversation. 'You will turn my head, sire,' she said, 'if you flatter me so.'

'And will it be the first time it has been turned?'

'No—I made a conquest of my husband the very night that we met.'

Napoleon understood well why she mentioned the Prince; she was nervously reminding him of her husband's presence.

'That goes without saying,' he replied; 'but—since then? You can confess yourself to me, madame—you know I have been anointed!'

'I will confess that one other man has shared my thoughts recently—thoughts of affection and respectful gratitude.'

He made a gesture of impatience. 'A poor substitute for stronger feeling,' he commented; 'neither men nor women are ever attached to one by benefits conferred. I beg you to displace me in your heart as a benefactor. I do not wish to enter it by the *escalier de service*.'

The Princess began to feel troubled. It was difficult to keep up the semblance of badinage when he insisted on being so personal and so intimate.

However, she laughed and shook her head. 'I do not think any staircase would keep your Majesty out,' she said, 'if you had made up your mind to enter anywhere. There is such a thing as a master-mind and a master-key.'

'Danton was right,' he remarked, 'when he said that only three things were necessary to success: *De l'audace, encore de l'audace, et toujours de l'audace!* What do you say, madame?'

'For a man,' she answered, 'yes; for a woman, no.'

'You are right,' the Emperor said. 'I have no sympathy with intriguing females. I have been accustomed to those who are amiable, gentle, and conciliatory—and such I love.'

There was a passionate fire in his eyes, and a dangerous ring in his voice. The Princess felt her heart beat quicker at the call of this magnetic personality; she began to understand Napoleon's extraordinary influence when he chose to exert it.

'You and I, madame,' he went on, 'are opposite in nature. We form a contrast which again completes a perfect whole. I should like to talk with you when we are more private. If you will depart now and return later, when the audience is at an end, we can arrive at a closer estimate of one another.'

It was an assignation, veiled but imperious—a demand more than an entreaty. The Princess looked involuntarily towards her husband, and caught an approving glance from him.

'You honour me, sire,' she answered.

'It is my delight to honour you, madame,' he replied. 'I shall be ready to receive you at half-past eleven.'

III.

It was at this critical moment that a letter was brought to the Emperor, who, with a word of excuse, opened it. It contained an enclosure, at which he glanced before crushing it in his hand. The Princess made a curtsey and turned to rejoin her husband.

Napoleon, however, looking past her, at

Prince Hatzfeld, made a gesture to him to approach.

'I have a communication here,' he said, tapping the letter he held, 'which reveals that certain information is leaking out to the Prussians about my troops. Will you render me assistance in discovering the culprit?'

The Prince expressed both surprise and loyalty. 'You can count on the Municipal Guard,' he said. 'There is not one amongst my men who is not grateful to you, sire, for your recognition of the guard, and personally I am absolutely at your service.'

Napoleon made a sign to Duroc at this moment, which the Marshal understood. He conducted the Princess to the door, and afterwards, one by one, dispersed the small company, telling them that affairs of State prevented the Emperor from granting any further audience.

During those moments Napoleon read again the letter in his hand, and then, looking intently at the Prince, asked, 'In your opinion, what should be the punishment for a spy who betrays a high trust?'

'Such a man,' answered Hatzfeld decisively, 'could expect no leniency. He should be arrested, tried by court-martial, and, if proved guilty, shot at once.'

The Emperor made no direct reply. Instead, he spoke to Duroc. 'Send for the guard,' he said.

The Grand Marshal obeyed; and there was silence for some moments until the guard filed in.

Napoleon returned their salute and gave a swift, brief order: 'Arrest the Prince Hatzfeld.'

The guard advanced; while the Prince, thunder-struck, broke into furious protest.

'What does this mean,' he said—'this injustice, this insult? You have made no accusation against me, sire. I demand to know with what offence I am charged. I refuse to yield.'

The guard looked for further orders, standing on either side of the Prince, who, with flashing eyes and a curious whiteness coming round his lips, confronted the Emperor, his hand upon his sword.

'The offence you are accused of is that of a spy,' Napoleon said. 'You have yourself suggested the proceedings that should be carried out if guilt is proved. I hold the proof here'—he struck the enclosure which he was grasping—'in a letter in your own handwriting.'

He made a signal of command to the guard, and the Prince, stricken dumb—for he had recognised his treacherous letter—yielded his sword, and was marched away.

'Duroc,' said the Emperor, 'Savary has just sent me this letter, intercepted on its way to the postmaster, containing an enclosure addressed to the King of Prussia. The enclosure is an account of everything that has happened in Berlin since my arrival here, with the minutest details as to my forces and plans. The letter concludes with a hope that King Frederick will soon be reinstated, while I am ousted. It is signed "Hatzfeld."'

Duroc was amazed. 'After your trust in him, and your magnanimity in placing him at the head of affairs, it is a poor return, sire. I am convinced the Princess has no knowledge of her husband's treachery.'

'Why?' The question was curt and peremptory.

'Because I knew her well before her marriage. She is gentle and straightforward, I am sure.'

'She is unfortunate, then, to be mixed up in this. The motive for her presentation to me is very apparent. However, there must be no delay in this matter. The Prince must be proved guilty—for this letter admits of no possible denial or exculpation—and will be shot forthwith. My presence here is not necessary. I shall keep my engagement, and the trial can proceed without me. I will see Savary before I quit the palace, but no one else, and will give him back this incriminating letter, with its enclosure, so that it can be produced in evidence. When Savary opens the sealed envelope I gave him this evening, he will find the name of the spy—Hatzfeld!'

He turned on his heel, and passing rapidly through the door leading to his own room, let it close after him.

IV.

Duroc walked up and down the *salon*, perplexed and undecided. The Emperor, doubtless, had gone to prepare for his midnight ride out of the capital; for the moment Duroc dared not disturb him. Yet there was still much to be arranged with regard to Hatzfeld's trial. Savary might, of course, arrive for an audience at any moment, and Duroc must be there to receive him and explain the Emperor's wishes.

As he paced to and fro there came a vehement knocking at the door, and finding there was no result to his permission to enter, the Grand Marshal strode to the door and opened it.

A figure in white satin passed swiftly in, and trembling hands were raised in appeal to him while Princess Hatzfeld's shaking lips tried to form the words which she had come to say.

At last she gained sufficient voice to stammer, 'My husband! They tell me he has been arrested!'

'It is, alas! true, madame,' Duroc answered gravely.

'Help me,' she exclaimed, 'for the sake of our former friendship! What is it that the Prince is charged with?'

'Alas, madame! it is with treason. I know of no way of assisting you. It is in the Emperor's hands. He has ordered that your husband be tried at once by court-martial.'

She reeled slightly and put out her hand to

support herself. Duroc gently assisted her to a chair. 'I must see him at once—the Emperor,' she said.

'Madame, he has given orders that no one but General Savary is to be admitted. He will grant no further audience now before he starts.'

'But he gave me an appointment—a rendezvous—here, at half-past eleven. He must have forgotten that. I have his own permission to be here.'

Duroc looked at her in perplexity. 'In that case,' he said with hesitation, 'it might be possible. Yet his orders just now were quite explicit. No one but Savary.'

The Princess clasped Duroc's hand between her own, her eyes full of tears. 'It is life and death,' she pleaded—'my husband's and my own—for I could not survive him. Let me see the Emperor. Tell him I came by his own appointment, and that you could not persuade me to leave—say anything you like—only, for the love of Heaven, let me see him!'

Duroc could not refuse her. 'I will risk the Emperor's displeasure,' he exclaimed, 'no matter what it costs me. Conceal yourself, madame, and when the Emperor passes through, you will have your chance. I will leave the room and keep any one from entering, so that the coast may be clear for you.'

She dried her eyes rapidly and rose, looking round for a hiding-place, and finally choosing the curtains which hung over a window close to the door by which Napoleon would return. Duroc disposed them so that she could watch the door without being seen by the Emperor, and then passed out to the corridor. Five leaden minutes passed, and then the door was flung open, and Napoleon, in his riding-gear, strode in, calling sharply, 'Duroc!'

The Princess glided out and flung herself on her knees. He stared at her angrily for an instant, then put out his hand, and, taking hers, made an imperious gesture for her to rise. 'How is this?' he demanded.

'You asked me to return at this time, sire.'

'I invited you to see how you would respond to my invitation,' he answered brusquely; 'to make sure that your husband's honour was not too dear to you.'

'It is not true,' she cried passionately. 'You have had my husband arrested for treason, but he is no traitor. He is innocent. I swear it on my life.'

'Your husband is a spy,' Napoleon answered, 'and must meet the fate of spies. But you—who responded to all my advances, even to this last and unmistakable one—what is he to you? You cannot pretend to grieve for a man whom you were ready to betray—as he has betrayed me.'

'Sire,' she said, her pride restraining the tears that burned in her eyes, 'you are cruel and unjust to both of us. I had no intention of bringing dishonour to my husband, and I should not have endeavoured to please you if it had not been for his wish. I meant, if he insisted on my keeping your rendezvous, to tell you, as I tell you now, that I love him better than my life. You would have been generous and let me go unharmed—you are too great a man to be ungenerous.'

'So—it was as I suspected,' Napoleon exclaimed; 'your husband wished to involve you, in the hope that if his treachery were discovered you would win his pardon from me. He is base indeed; even you, who love him, cannot fail to condemn him for this traffic in your charms.'

'Sire,' she said, 'he wished me merely to please you in order to soften you towards our people—nothing more. He had not anticipated, any more than I had, that you would pay so much court to me. He loves me, and he is innocent. Give him back to me, and he will serve your Majesty well and truly. You have been misinformed. He is no spy.'

Napoleon, gazing steadily at her, took from his breast the letter and held it out to her.

'Whose handwriting is this?' he asked sternly. 'The writer of this letter is the traitor.'

She took the letter and scanned it; then she burst into tears. 'It is my husband's writing!' she sobbed. 'God help him!'

Then, as Napoleon's gaze softened a little—for he had shown her the letter to test her, and to see if she would have some ready lie with which to cajole him—she sank again on to her knees and lifted her clasped hands to him.

'Sire,' she said, 'I have heard that your Empress is very dear to you, and that your greatest wish has been to have a son of whom she was the mother. If this were so, would you refuse her anything that she asked you? If she were only here, I would appeal to her. I would say, "When my son sees the light he will learn that his father died a shameful death as a traitor, and that he has only a broken-hearted mother to console him for such a loss."'

Napoleon's stern regard melted. Again he raised her, but with a gentleness this time that was almost tender. 'You are right, madame,' he said; 'the Empress Joséphine is very dear to me, and for her sake I have sympathy with all women who show goodness and feeling and truth—as you have done. Your husband is fortunate in having such a wife, and in the prospect of a son who may inherit her good qualities.'

'You will pardon him, sire?' she whispered breathlessly.

'Madame, you hold the sole proof of the Prince's guilt in your hand. If you refuse to return it to me, what can I do? I do not war against women, as I told you.'

She looked at him with an eager question. 'You mean, sire——?'

'I mean that if you were to destroy it, I should be compelled to order the Prince's release —since there would be no documentary evidence against him.'

She gave a long, deep, rapturous sigh, and, with her eyes on the Emperor, moved to the fireplace and held the letter over the flames.

The Emperor made no attempt to stop her. She dropped the envelope and its contents into the heart of the fire.

Then she came back to him, with shining eyes and a radiant smile on her tremulous mouth.

He stretched out his hand and took hers; and, as she raised his to her lips, he called 'Duroc!' in a loud, clear voice.

The Grand Marshal entered quickly and stood just inside the door.

'The Princess,' said Napoleon, 'whom you permitted to enter here, has so much belief in her husband's innocence that she has indignantly destroyed the compromising document. We have now no evidence against him. See that he is immediately released, and informed of the circumstances.'

Duroc bowed and withdrew.

The Princess would again have knelt to thank the Emperor, but he prevented her.

'Your husband has a better wife than he deserves, madame,' he said. 'Tell him, from me, to cherish and protect her. May Heaven grant to all of us such loyalty as yours.'

He led her to the door, and stood saluting her as she went out. Then, with a return of his usual imperious manner, he rapidly passed into the corridor and was gone.

THE SAILOR-MAN AT PLAY.

By Lieutenant-Commander the Hon. J. M. KENWORTHY, R.N., M.P.

SPORT and work in the navy have always been very closely connected. In the days of yards, masts, and sails, for example, the whole efficiency of a sailing squadron depended upon the seamanship of the crews, and the rapidity with which they could make or shorten sail and replace damaged yards and topmasts. A spirit of the keenest rivalry existed between ships and squadrons in this matter; and on 'general drill' days, when the whole forenoon was spent in sail drill, no sporting event on shore could have produced fiercer competition. Equally keen were the ships' companies in the matter of coaling, when every unit on board would lend a hand in an endeavour to beat the other ships of the squadron. The crew of the ship which came out top of the squadron in those trials took no pains to hide their pride when on shore—a fact which sometimes led to resentment amongst the other crews, and, occasionally, to fighting. I have known the crews of two battleships come to blows, and a regular riot to follow. On one of these occasions, at Hong Kong, we had to land a patrol of three hundred men to separate the combatants!

The worst fight I ever knew, however, was not between British sailors, but between the crews of an American and a French cruiser at Hong Kong. During the course of this battle no fewer than seven men were killed and a score injured. The whole trouble started with an argument between an American and a French sailor as to whether the 'Marseillaise' or the 'Star-Spangled Banner' were the finer tune.

Boat-racing has always been one of the navy's favourite sports. A man-of-war's boats are, of course, built on entirely different lines from the elegant river-boats in which you disport yourselves on the Thames. They are built for hard use at sea and for life-saving, although, at the same time, they are more fitted for speed under oars or sail than the lifeboats of a passenger-steamer. An annual regatta was the recognised thing in every squadron in the navy. For a whole day, and sometimes two, different classes of boats and different classes of men would compete against each other. The boats ranged from the great eighteen-oared launches down to the little skiffs holding four men, and we always used to wind up with the 'All Comers'' race, for which sometimes as many as a hundred boats of various sorts would enter. Any rig was allowed, and we would fit up boats to take as many oars as they could carry.

A captain's galley, for instance, is fitted for six oars; but, by ingenious carpentry, it was possible to row ten oars in her, and I have seen one fitted with nine oars aside. This made a very effective arrangement, known as a 'centipede.' It was usually a galley, fitted to row ten or eighteen oars, that won the All Comers' race—but not always. I have known a launch fitted to row twenty-four oars, with three men to each oar. With a well-trained crew, she would surge along like an old Roman fighting-galley; and in choppy weather, owing to her great size, she would have an advantage over the lighter keels. I remember one three-mile All Comers' race being won by a launch, trained by myself, by a quarter of a mile.

In later years an attempt was made to transfer the rivalry of boat-racing between ships to target practice with heavy artillery. But although the shooting was taken very seriously, the results depended so much on just one or two men that target practice was never popular to the same extent as the boat-races, in which every man could do his bit.

Turning to the more personal sports of shooting and fishing, the navy, of course, enjoys unique opportunities in these directions. One of the best places for fishing that I ever visited was the Russian Maritime Province in East Siberia. The country was very sparsely populated, with magnificent rivers running down from the hills. Our only anxiety was the bears. Master Bruin used to come down to fish for salmon in the shallow waters of the rivers. Sometimes he objected to our presence, and then he would attack us. We were, therefore, obliged to carry rifles as well as fishing-rods on these expeditions.

But the most extraordinary place for fish I ever visited was Perim Island, at the entrance of the Red Sea. It is usually spoken of in the navy as the last place God made. It is absolutely barren, without a bit of green stuff on it; it is supposed to be the hottest place in the world, and I should think it is certainly the most unpleasant. Never have I seen such a profusion of all sorts of fish, however. On one occasion we fired a sixteen-pound tin of gun-cotton in the harbour, and the whole surface of the sea was quickly covered with every kind of fish, from sharks, twenty feet long, downwards. There were sword-fish, flat-fish, sun-fish, star-fish; fish covered with spikes and spines; spotted fish, striped fish; fish of every colour: red, green, gold, yellow, silver. Such a collection as no aquarium in the world could show, or museum exhibit. We had three boats out, and we filled those boats until they were in danger of being swamped. We brought back enough fresh fish for the whole ship's company of eight hundred officers and men. Some of the fish were very good indeed, and nobody was the worse for eating any of them.

Mention of Perim reminds me of an amusing story, which, although not strictly naval, is too good to miss. There is a small garrison of Indian troops, with one white officer, on the island; and this white officer used generally to be sent there more or less as a punishment. The appointment was for one year. Well, a certain lieutenant in one of the Indian regiments had come under a temporary cloud, and was appointed to Perim for a year. At the end of the twelve months the War Office officials and every one else concerned were astounded by the receipt of a request from the lieutenant for the extension of his appointment for another year. The powers that be were so delighted at finding some one who liked Perim that they hastened to extend the appointment as desired.

That summer a general on the Army Council happened to go to the Derby, and in the crowd saw a young gentleman who, he felt certain, was Lieutenant Blank, the Commanding Officer at Perim. He went up and accosted the young man, but the supposed lieutenant denied all knowledge of any connection with the army. The general, however, had his suspicions, and sent a cable to Aden, the nearest garrison to Perim. The Governor of Aden, in obedience to the cable, despatched a gunboat to Perim, where the captain of the gunboat found the company of native soldiers under the native sergeant, and everything apparently quite in order, except that there was no white officer. It finally transpired that Lieutenant Blank appeared at Perim only for the annual inspection by the Governor of Aden, and spent the rest of his time enjoying himself in England!

But to return to the subject of fishing. This sport is not usually associated with the idea of imperialism, and yet it has played a curious part, in one instance, in the story of the British Empire. Before San Francisco was incorporated in the United States of America, it was a sort of no-man's-land. At that time there was a small British squadron in the North Pacific, and the admiral in command was ordered to take his flag-ship and visit San Francisco. He was to report on the country, with a view to its annexation to Canada. Now, the admiral was a Scotsman, and a very, very keen fisherman. Judge of his delight, therefore, when he found a country where the rivers simply teemed with salmon. No doubt he looked forward to some record sport, and it is not difficult to imagine how complete was his disgust on finding that, try as he would, he could not get the fish to look at a fly! In fact, he was so bitterly disappointed that he made an extremely unfavourable report on the whole country, and as a consequence the idea of adding San Francisco to the British Empire was dropped.

Some of the best shooting I know of is to be obtained on the China Station, where snipe abound. The officers of the battleship *Glory* discovered a marsh near Wei-Hai-Wei, which we call 'the Glory Marsh,' and which is a splendid snipe-ground. Once an officer in my own ship started to shoot this marsh in the morning. By lunch-time he had fired away all his cartridges and picked up seventy-two couple of snipe. The snipe move southward in winter—which reminds me of a certain Irishman who commanded a small gunboat. This officer was very keen on shooting, and whenever the snipe moved down the coast, he always discovered a reason for moving down after them. Those were the happy days before we had wireless telegraphy, and when there were few cables on the China coast. A commanding officer out there at that time was, therefore, very much his own master, and so the Irishman was able to spend the winter shooting snipe in peace.

On one occasion the captain of one of our ships was out snipe-shooting in some swamps in north China. A bird rose from some long reeds, and he fired at it, but had the misfortune to pepper a Chinaman who happened to be at work in the next field. The man suffered no serious

injury, but about a dozen pellets had entered his limbs, and the naval officer was naturally very much distressed over the accident. He offered twenty dollars as compensation, a sum which was then equal to about two pounds in English money, and the Chinaman accepted this with every sign of delight. His relations also expressed entire satisfaction, and we thought that was the end of the matter. But there was a sequel, and rather a tragic one from the sportsman's point of view. For the tale of the wounded Chinaman and his compensation spread like wildfire, and men, women, and children flocked out to the snipe-grounds. Here they would secrete themselves in all manner of places, and directly a snipe got up they would jump up too, hoping to find themselves in the line of fire. Life is cheap in China, and these thrifty people were perfectly ready to take the risk of death, on the chance of getting a slight wound *and the compensation*! The end of it was that we could not go shooting anywhere within fifty miles of the place where the accident happened; so in this way we lost one of our best shooting-grounds.

Although, as a rule, we were on very good terms with the country-people, I have known a shooting expedition in China to end in disaster. While I was out there a party from one of our cruisers penetrated some way inland, were attacked by Chinese brigands, and killed to a man.

Good shooting was also to be had in the country-places of Spain, Portugal, Greece, and Turkey, where every one could go and shoot over any one's land. The natives themselves never seemed to bother about shooting; in fact, they appeared to consider woodcock, snipe, and partridges as vermin. They were always glad to see us, and to earn a little money as carriers or beaters.

So in every part of the world sport of one kind or another awaits the sailor-man, and he must be a dull dog indeed who cannot look back to happy days spent on some foreign station, in the indulgence of his own particular sporting tastes.

MAN'S WORK.

CHAPTER V.

I.

BE it again said that the occurrences which make the turning-points in men's lives are themselves generally of small importance. It is not till one looks back over the trail that one observes its successive windings. A chance meeting, a change of expression, a single word (deliberate or hasty), a question, or an answer—by such is destiny determined. Nor do all men's efforts, hopes, or fears undo a whit of what has once been done.

Thus, if Shanklin had not raised a point of honour, if he had not stuck to it, and if he had not happened upon Harrison punching holes in the great anticline south of Los Angeles, he would not have been strolling along the high-road a mile or so from his work, and wondering just where he would turn when that work was done. He was divided between the consciousness that he was a more capable man than two months previously, and a great hunger for Claudia. That she was Sitwell's wife made no difference. He had written on hearing of the death of Courtney Brooks, and had received in reply a polite, impersonal acknowledgment. But he could not know that Claudia had sat long in a maze of doubt and regret before she forced herself to write it. And it was as well for them both that he did not know.

He progressed leisurely through the flat land that just here cut off the great anticline as though with a sickle, and half a mile west of the ridge sat down and lighted his pipe. In a field two hundred yards away a man was digging in an irrigation-ditch. Presently an oath drifted through the quiet air of evening: 'Rock! By the great horned spoon, rock!'

The man stopped digging, and, leaning on his spade, was frowning down with disgust on his tanned face. Presently he started off towards a small house a quarter of a mile away.

Shanklin looked after him with a smile. Hard luck, he thought, to find rock where, to judge by the slope of the distant anticline, there should be hundreds of feet of earth. For a moment he puzzled lazily over this, till, quite unconsciously, he heard a tiny voice that asked what kind of rock it was. From that he seemed to move into a hush, as though there was something in his mind that wanted to get out and express itself. Then suddenly he drew a long breath, and climbing the fence and endeavouring not to appear to hurry, he tramped across the springy soil and peered into the ditch. In the bottom he saw a foot square of reddish-yellow shale from which the earth had been scraped away.

II.

Two hours later Harrison was wakened by a hand on his shoulder. 'Get up; I want to talk to you.'

Harrison was tired after a hard day. 'What's the matter? Keep it till to-morrow.' He listened a moment to the rhythmical beat of the engine and closed his eyes. Nothing was wrong there.

'It won't keep,' said Shanklin softly. 'Honest—get up.'

The other man pushed his feet into his slippers and stood for a moment blinking. The night had grown dark, and few stars were visible. 'What the devil is the matter with you?' he yawned, good-natured in spite of it all.

Shanklin pushed a fragment of rock into his hand. 'What do you make of that?'

The contractor held it against a lantern; then his brows drew together in sudden anger. 'By God! did you wake me up to show me this?'

'Where did it come from?' persisted Shanklin evenly.

'Off this lot. It's shale rock. Are you crazy?'

'It came from the valley, about half a mile west of here. Am I crazy?'

Harrison rubbed his eyes and gave vent to a low whistle, instantly cut off. 'It's shale,' he said with a touch of awe. 'In the valley—half a mile from here!' Then, as though the thing were too incongruous for words, 'You've been walking in your sleep, Jack.'

Shanklin grinned. 'Put on your boots, bring a short piece of steel, and come and see.'

There was little sleep for either of them that night. They were back in camp in another two hours. Harrison, as was his wont, had said but little even when he stood on solid shale at the bottom of the ditch, and stared first at the rock under his feet, then round at the sleeping country. The lights along the great anticline formed a row of yellow points that stretched southwards, broken only by the flats where the valley cut through. They were in the middle of this flat, but beneath him was the formation which his plunging-bit had reached five hundred feet from the surface and half a mile east. The thing was incredible, but it was true. He chipped off a pocketful of samples, climbed out, and the two started back almost silently. The occasion seemed too big for talk.

Once in the little office, Harrison lighted the lamp, pulled down the blinds, motioned Shanklin into the chair at the rough wooden desk, and pushed a pencil into his hand. 'Get it down on paper and see if it looks the same to both of us.'

The younger man blessed the midnight hours spent over geological text-books, and set to work. He plotted the anticline like a long, narrow French loaf, then chopped a small section out of its middle. This section he indicated as having been moved to the westward, still maintaining its general direction. Then he outlined the flow of waters which had worn down its crest, and the alluvial deposit which now covered to an unknown depth its entire surface, with the exception of that one square foot which had interrupted the progress of an irrigation-ditch. At last he looked up. 'Is that what you make of it?'

Harrison glanced at him with new respect. He had a certain amount of geological knowledge, but could never have assembled and presented the thing like this.

'How much is left of that anticline in that valley we sha'n't know till we go after it.'

Shanklin nodded. 'That's what's in my mind.'

Silence fell, and each man knew that the other was exploring his own resources. The younger noted his companion's strong features, and thanked the guardian angel who had led him hither. Presently they found themselves staring at each other.

'I've got seven thousand dollars,' said Shanklin thoughtfully.

'I've got the rig—that's worth thirty thousand. I can raise some money on it.'

'Then you take the big end of it.'

Harrison shook his head. 'I don't do business like that. You found the property, so get hold of it and put it in. I'll find the rig, and work for nothing myself. Then we both get after the rest of the money.'

'How much?' Shanklin's heart was beating irregularly.

'As we'll go about it we should do it for forty thousand, allowing for some bad luck. I've learned to allow for that.' Harrison paused for a moment. 'Before we decide on this thing we should look it in the face. If we don't get oil, we're broke—badly broke. You know now how it is.'

'But you believe that this anticline has been faulted, and we've established the fault?'

'Sure, you've established it.'

'And the average flow of wells in the shale is somewhere about three thousand barrels a day?'

'More than that on the crest of the anticline.'

'Then what it amounts to is that our bit of shale carries all its original oil, and that if we get anything it ought to be big.'

'That sounds right enough; it should be.'

'And we've got the rig and enough cash to get an option and have something over to stand with?'

'That's so.' Harrison began to grin.

Shanklin paused for a moment. It struck him suddenly that his operations were going to be remarkably like those of the Enterprise Company—at least superficially. He proposed to drill on a spot which engineers and prospectors had not even thought it worth their while to consider. What if this patch of shale were only a large and isolated fragment, carried there by some geological convulsion and lost in the brown earth? He put this contingency to Harrison.

'No; that's not float rock; it's in place. I can tell by the sound of it under the steel.'

'Well, then, are you game? If so, I'll draw up an agreement.'

A large, hard palm was extended. 'Forget the agreement, and shake on it. We're in together—even partners.'

There was more talk, and it was settled that Shanklin should go in pursuit of his option. Then he crawled into his bunk—but not to sleep. What grotesque twist of destiny was he about to pursue? He was banking on geology and experience. Sitwell was counting on human nature and ignorance. But to all outside appearances they were playing the same game.

III.

It was in the middle of the morning that Harrison, busy splicing a steel rope, looked up and grunted. 'Visitors—darn them!'

As he spoke a car climbed up over the shoulder of the ridge, lurching unsteadily towards them. It came nearer, and Shanklin discerned a man and three women.

'That is the worst of this anticline. Every tourist that rolls along the road wants to come up and poke around,' grumbled Harrison. 'We're too near the highway. Every now and then some crank blows in with a lot of Easterners to show 'em what their well is going to be like—when it's finished. Reckon here's one of them now.'

Shanklin's eyes rounded. The car was near enough to reveal Sitwell at the wheel, beside him a girl. Behind was Claudia with an older woman. They were all talking gaily as they stopped for a moment, then came on. Shanklin, with his heart in his mouth, pulled his hat down over his eyes, glanced at his stained overalls, and sauntered round to the far side of the derrick. The car came closer. Shanklin edged behind a corner of the sleeping camp, and stared hungrily at Claudia. She seemed animated and very beautiful. Her black cloak revealed the grace of her figure. It was the first time he had ever seen her in black. Then he remembered, and his eyes hardened as they turned to Sitwell.

The latter leaned forward over the wheel. 'Good-morning,' he said to Harrison. 'May we wait a moment and see how a well ought to be driven?'

The contractor glanced at the three ladies. 'Sure, you can; but there isn't much to see.'

Claudia smiled, but did not speak; and Sitwell, with a word of thanks, began to talk. Shanklin, listening, admitted that he talked well. Presently Harrison moved off. Sitwell's voice lifted a little and grew even more confident. He got the ladies out of the car, and they inspected the mouth of the well and the dipping cable that reached into the depths where the sullen bit was at work.

'We'll be doing this very soon ourselves.' His eye caught that of Edith Winter. 'There's our property close by.' He pointed eastward, where, a mile away, glinted the Enterprise sign. 'You can see what a good locality this is—these wells are the best known and the most reliable in this field.'

Miss Winter looked a little puzzled, but her mother stared up and down the great anticline with rising excitement. 'I think it's just wonderful, Edith, that we were lucky enough to come and see for ourselves. What did Mr Sitwell tell us this field was yielding?'

'About four hundred thousand barrels a day; that's nearly six hundred thousand dollars,' said Sitwell.

'Don't you think the Enterprise property looks—well—a little lonely from here?' put in the girl quietly.

His eyes took on a shade of humour. 'I'm glad you asked that. It does on the face of it, but our engineer tells us that the same formation is there, just beneath the surface. It goes to the far edge of our ground—but no farther.'

Had Sitwell added that he was his own engineer the statement would not have sounded so plausible, and, even as it was, Shanklin, listening from his corner, noted that the girl looked only half-convinced. Then her mother came in again.

'It's all perfectly clear to me, Edith. There's a lake of oil under here, and Mr Sitwell's—I mean, the Enterprise property is just on the edge of the lake.' She spoke in a sharpened voice. The smell of oil and the thump of machinery were getting into her blood. 'I'm quite satisfied,' she went on, 'with all we've seen to-day, and I think we're very lucky. This is going to be a surprise to some one we both know.'

Sitwell tapped a cigarette on the back of his hand, then, remembering that he was on an oil-field, slipped it back into his case. His lips had a pleased smile. Claudia was looking at Mrs Winter with an expression of mingled relief and apprehension. Shanklin, watching her with all his eyes, wondered if by chance she had been forced into Sitwell's campaign. But, he remembered, this had been her father's scheme, and she believed absolutely in her father. He scanned the other girl's capable face, and got the idea that somehow she would be able to look after herself. There had ensued a little pause, when Mrs Winter went on again with every sign of rising fever.

'I'm telling you now, Edith, that, as your guardian, I feel this oil business is good enough for you to put your money into. You'll thank me some day. You're getting five per cent., and these wells are paying—what did you say, Mr Sitwell?'

'Anything from twenty-five to a hundred and fifty.'

'There you are—and from a man who knows. No wonder a lot of people stay poor. Why can't you be guided by me?'

The girl did not answer, but sent instead a

queer little glance at Claudia, as though asking what Claudia, from her superior knowledge, thought about it all. Was she as confident as her husband and this excitable mother? Shanklin caught that glance and held his breath. He would know now where Claudia stood. The latter did not move, but sent back a wistful look which said nothing, revealed nothing. It was a strange instant of silence during which hidden factors were at work. Something of it seemed to reach Sitwell, whose hand was in his pocket fingering an application form.

'Suppose we go and see some more wells?'

Mrs Winter revolted, and plumped down on a balk of timber. 'Edith, why are you so difficult? I've seen enough wells, and I'm satisfied. I don't want to go any farther.'

'Then what about home, and something cool to drink?' put in Claudia, seeing that the older woman had gone to the limit of her power.

'That's right; come along, Edith.' Mrs Winter climbed into the car and fanned herself. 'Just to think that we're right on top of a lake of oil!' she murmured, leaning back and regarding the line of derricks dwindling into the distance.

'Just a minute—I want to look at this engine.' The girl stepped forward and stood within a few feet of Shanklin.

Shanklin felt a slight drumming in his ears. Here was another opportunity for altruism. It wasn't his affair, but this girl's fortunes hung in the balance. Her mother, the pendulum, was swaying unmistakably towards Sitwell. He was conscious of a clamour assuring him that it was no business of his, but through this he heard that same small voice which had first stirred when he scanned the title-deeds of Courtney Brooks, the deeds for the land he could see a mile away. Something in the purity of the girl's face moved him profoundly. It was wistful, and carried a supremely honest appeal. This passed through his mind like lightning—with the thought of Claudia. Would the Enterprise affair be her finish too? Then the small voice spoke again, and he leaned forward. 'Keep out of it,' he whispered; 'don't touch it!'

The girl turned quickly and got a glimpse of a face that seemed in a queer way familiar. Her lips parted, and, even as she stared, he vanished.

She hesitated a moment ere rejoining her friends, then climbed into the car with a questioning glance at Claudia and the others. They had seen nothing, and she felt vastly relieved. All the way home she puzzled. The tones had been strange, but there was that in the man's eyes and mouth that reminded her irresistibly of some one she had seen but recently—and in California. Suddenly she remembered the photograph between the pages of *Marcus Aurelius*.

(*Continued on page 132.*)

SURPRISE VISITORS AMONG THE STARS.

By Professor GEORGE FORBES, M.A., F.R.S.

I.

THE certainty and immutability of the laws that govern the movements of stars and planets has something to do with the satisfaction felt by the ordinary man who watches them. But the human mind is not content with monotony; so it happens that when, at rare intervals, an unexpected guest among the stars swims into his ken, the 'watcher of the skies' welcomes the intrusion with unbounded pleasure.

There are three, and only three, kinds of unexpected starry visitors that may suddenly appear to such a watcher—at any date, without warning. Minor exhibitions are not infrequent, but it is very seldom that they reach the splendour with which all three types surprised and delighted both astronomers and the public some sixty years ago. These welcome but unusual visitors were certain exceptionally fine examples of comets, meteor-showers, and new stars; and the years 1858 and 1866 have ever remained as landmarks to a passing generation of astronomers.

In the year 1858 we saw Donati's Comet, with a glowing nucleus and a huge, curved, spreading tail of light, stretching to a length of 50,000,000 miles. Its head moved visibly among the stars from week to week, and the whole breadth of its tail was seen to pass Arcturus in two hours. This comet had never been seen before, and its brilliant aspect has perhaps never been excelled. It will never be seen again, and down to this day we have not seen its equal. Yet, its rival might be found in the sky to-morrow.

In the year 1866 we witnessed the most superb shower of shooting-stars, or meteors, ever seen in the memory of man. During three hours, hundreds of stars every minute, many of them brighter even than Sirius, swiftly swept in a few seconds, from the east, across the sky, leaving broad luminous trains. Since then we have never seen so magnificent an example of a meteor-shower. And yet, its rival might be witnessed to-morrow.

In 1866, again, a great, bright new star of the second magnitude shone for some months in Corona Borealis. Nothing like it had been seen for two centuries. The surprise and the wonder it excited were beyond description. Since then, as it happened, in 1901 and in 1918, new stars of even greater brilliance have startled the

watchers of the skies. And their rival might burst forth to-morrow.

Although comets, meteor-showers, and new, or temporary, stars seem to have little in common, yet in 1866 astronomers discovered that comets and meteors do really belong to the same class, and a theory of 'new stars' has been accepted by many astronomers which was suggested by the luminescence of meteors. Thus the three kinds of surprise visitors that alone appear among the stars may well be considered briefly in a single article.

II.

COMETS.—Although the magnificence of a comet like that discovered by Donati in 1858 may hardly be expected once or twice in a century, yet we do, not infrequently, have visits from very remarkable comets. Most people can remember that, in January 1910, while every one was looking forward to seeing Halley's Comet, already foretold, there suddenly appeared in the evening sky another and totally unexpected comet, so bright as to acquire the name of 'the daylight comet,' because it could be seen in the daylight. Immediately after sunset it used to shine with a bright head, and a long, straight tail pointing upwards, away from the place where the sun had just set. And in this respect it behaved as comets with tails invariably do. The tail always points away from the sun. This remarkable fact leads us to the conclusion that the sun, for some reason, is obliged to repel some part of the atmosphere surrounding the head or the body of the comet.

Comets vary much. Sometimes they have no tail, and only a nebulous nucleus. Others have many tails. These start from the comet's head in a line away from the sun; and then, as the comet itself sweeps round the sun, the ends of the tails are left behind, to a greater or less degree, and so the separate tails are more or less curved. The normal comet, seen in a telescope, has a bright head or nucleus, surrounded by an envelope or atmosphere apparently projected from the nucleus *towards* the sun. Then the repulsive force seems to drive it back in a stream, starting directly away from the sun, in a line that is curved in the plane of the comet's motion. The spectroscope tells us that much of its light is reflected sunlight, but the head is partly self-luminous from carbon and metallic vapours. Variations from the normal type are numerous, and should be studied in special comet-books containing drawings or photographs.

It may be said that, for centuries, the most inexplicable phenomenon in the whole of astronomy was this repulsion by the sun of a part of the comet's material. We all know that, by Newton's law of gravitation, the body of the comet is not repelled but is attracted by the sun; and so it is guided and directed in its course through the solar system. Why, then, should the sun have a power to repel the tail while it attracts the nucleus? The astronomer appeals to the natural philosopher, who experiments in his laboratory upon the forces of nature like heat, electricity, light, magnetism, and so on.

The favourite suggestion to-day is founded upon the undulatory theory of light, according to which the atoms of which the sun or a star is composed are vibrating, and transmit waves outwards through an æther that fills all space, the waves being absorbed, more or less, by any material they strike. Now, it has been proved mathematically, and, as some claim, experimentally, that if the undulatory theory be true, then very small separate particles like the atoms in a comet's atmosphere would be repelled by the sun's light, in opposition to the attraction due to the sun's mass. The principle is a perfectly sound deduction. Multiple tails are explained by the greater velocity of the lightest atoms (hydrogen). Thus the hydrogen tail is straighter and less curved than the carbon tail.

III.

Although members of the solar system generally, by their strict obedience to the law of gravitation, seem to be a contrast to erratic comets, yet there is no class of bodies in the heavens that has done more than comets have done to establish the universality of that law. Sir Isaac Newton's discovery of gravitation was related to the solar system and elliptic orbits (a special kind of oval). But his theory showed that there are other curves which the sun might compel the wandering orbs to pursue, provided their velocity were large enough. If a comet, travelling from interstellar space, were to come within the sun's attraction, the sun would increase its velocity and deflect its path until that path would be perpendicular to the sun's attraction. Thereafter the solar attraction would diminish the comet's velocity as the comet receded, and it would deflect the comet's path less and less, until the comet would return to interstellar space with exactly the speed it had at first. Such curves are called parabolas and hyperbolas. And Newton found that all the comets of which he possessed observations of position seemed to be really travelling in parabolas. When far away they are invisible, not only by reason of their distance from us, but because of their distance from the source of light, the sun, that illuminates them.

An ellipse may be so elongated as at its ends to resemble a parabola. The observations used by Newton for cometary positions were hardly exact enough to show the difference. It was not Newton, but his friend and helper Halley, Astronomer Royal, who discovered that the comet of 1682 was travelling in an ellipse, a very long oval, with one end encircling the sun, the other end away beyond the exterior, and then unknown, planet Neptune. Thus Halley

discovered a new member of the solar system, and a new type of member.

Halley's comet returns to visibility, near the sun, every seventy-five years, and its returns have been identified for thousands of years in Chinese and other records. We now recognise Halley's as one of a whole family of brilliant comets having periods of about seventy-five years, and reaching out beyond Neptune. There is another and larger family of rather insignificant comets, whose periods are six to eight years, in far less elongated orbits, apparently belonging to Jupiter, as the Halley family do to Neptune.

Each expected return of Halley's comet in the last two hundred years has roused a contest among mathematicians to compute with the greatest accuracy the time when it will next reach its closest approach to the sun. The attraction by each of the planets, sometimes hastening, sometimes retarding, the comet in its voyage, is computed from day to day for the whole period during which, invisible to us, it is pursuing its course. When Halley's comet returned in 1910, it very nearly conformed to the extremely exact time-table published by the Greenwich astronomers, Cowell and Crommelin. For although, after a journey of seventy-five years, it was late, yet it was late only by two and three-quarter days. And such was the confidence of the mathematicians in their calculations that they asserted positively that though errors might account for the fraction of a day, yet the remaining two days must be due to the attraction by some matter (perhaps a planet) not known to astronomers.

This gives rise to what may be a fantastic suggestion, a hope that comets, when they leave our range of sight, may often be used as messengers to pick up information about distant members of the solar system, and to deliver this information on their next return, in the way that Halley's comet did to the Greenwich astronomers.

Some comets, then, belong to the solar system, and return. But most of them come from interstellar space, and after a short visit go back there for ever. They seem to consist of matter in the form of powder or gravel, and gas. Since all of these particles cannot be in the same place, they travel in different orbits, and probably collide when nearest to the sun. The result is doubtless to distribute streams of particles along their average orbit; and this has been found to be true from a study of meteor-showers.

IV.

METEORS.—It is impossible to write a description that would do justice to the great shower of meteors, or shooting-stars, which we saw in this country in 1866, from 11 P.M. on 13th November till 2 A.M. on 14th November. The display was not unexpected, but it began in a startling manner, suddenly, like a concentrated discharge of rockets from a point on the eastern horizon, at the moment when Regulus and the sickle-shaped curve of stars called Leo, the Lion, were rising out of the sea. In five minutes the performance was in full swing, great bright stars all starting from near Leo, all radiating from a point in the middle of the sickle, all shooting over our heads, or away to the right and left of us, all travelling like orange-coloured lights for two or three seconds and dying out, leaving only a long, luminous trail, broadened in the middle, with which they had in their flight painted the vault of heaven. These trails generally lasted for a few seconds, but sometimes for many minutes, curling up and drifting in serpentine forms, as light clouds are drifted by the breeze. Some of the stars were seen to burst in their flight. Every few minutes a shout would come from a friend, and, turning round, we would see a flight of several together, pear-shaped, bright as Venus until they were burnt out. Then the lanceolated phosphorescent trails, pointed at the ends, grew broader, and were watched in their changing forms until they, too, faded away.

The radiating of all the lines of flight from a point in Leo was clearly an effect of perspective, just as, when one stands in a long, straight street of uniform houses, the lines of house-tops, of roof-edges, of windows, and pavements, which are really all parallel, seem to diverge or radiate from a single distant point on the horizon.

The height of meteors in the atmosphere above the surface of the ground has been measured by the ordinary method used by surveyors for getting the height of a distant mountain. Their altitude generally lies between thirty and a hundred miles. The meteors themselves, consisting of small bits of metal or stone, strike the rarefied atmosphere at those altitudes with velocities commonly ranging from twenty to forty miles a second. The friction of the air retards their motion, and the motion of the mass is converted into the molecular motion which constitutes heat, and the temperature rises to incandescence. There is not the slightest doubt that this conversion of visible motion into heat is the cause of a meteor's luminosity. Particles are torn by abrasion, pulverised and melted by friction with the air, and leave a luminous trail in the meteor's wake.

V.

The shower of 1866 was not altogether unexpected, for in 1833 and 1799 the November meteors radiating from Leo had attracted great attention in other parts of the world, whence they could be seen. Records of their periodical visits had been traced back in old records, almost every thirty-three years, to A.D. 902. And astronomers noted the fact that, if a great cluster of fine gravelly matter were revolving round the sun in an orbit slightly inclined to the earth's plane of motion (the ecliptic), and cutting it in November, the phenomena of the meteor-shower would follow as a natural consequence. More-

over, if the period of revolution were about eleven days more, or less, than a year, a shower would occur every thirty-three years. Or, again, if the period were thirty-three years, the same thing would happen. In this last case it was clear that, in the interval between showers, the cluster of meteoric matter must travel out to a great distance in the solar system, near to Neptune, and back.

In 1866, while the whole world was taking an interest in the remarkable meteor-shower which had just been seen, astronomers made a wonderful discovery about a comet seen during the previous year. In fact, they found that it had a period of just thirty-three years, and was travelling in an orbit cutting that of the earth in November, in a direction pointing from the very spot in the constellation Leo whence the meteors were seen to radiate. It seemed certain that if the meteors travelled in the larger orbit, and not in a period of about a year, then the meteoric cluster is an appendage of the comet, detached from it, and travelling in a long, narrow stream which the earth crossed in three or four hours.

Finally, Professor J. C. Adams, discoverer by calculation of the unknown planet Neptune, determined to settle for ever the question as to which of the three orbits belonged to the meteors. He undertook a more laborious calculation even than his Neptune research, so laborious that it seriously affected his health. The object was to calculate any gradual change in the orbit that might be produced by the attractions of gravitation exerted by the masses of Jupiter and other planets. His result was that, with a thirty-three year period, the planetary attractions would twist the plane of the orbit so as to retard the point where it meets the earth's orbit by eight hours in each revolution, or one day per century. Also, that no such retardation would affect the other two orbits. Now this is exactly what was found to be the case from old records going back to A.D. 902: the meteor-shower had always been delayed by one day per century. Thus Adams established with absolute certainty the orbit of the November meteors, agreeing exactly with the orbit of a comet. That is the history of the great discovery of identity between comets and meteors. Further identifications of meteoric with cometic orbits have been established beyond a doubt, and a still larger number with a high degree of probability.

When a cluster of meteors is dense enough to constitute a visible comet, on reaching *perihelion* (or nearest point of the orbit to the sun) collisions and tidal frictions must take place between the particles. This gives rise to high temperature, in addition to heat then derived from the sun. Thus at perihelion we might expect a comet's nucleus to shine not only by reflected sunlight, but also by incandescence due to its high temperature. And this is what the spectroscope tells us is truly the case.

The only really great meteor-shower since 1866 was one which was a splendid confirmation of their cometic origin. Biela's comet, a small one of six years' period, used to be observed at each return to perihelion. In 1846 the turmoil of its parts, already mentioned as occurring at perihelion, broke the comet up into two pieces, which sailed away independently. On the occasion of two subsequent returns the parts were again seen. They were then lost for ever. Their orbit happened to cut that of the earth at her position on the 27th November. And on that date, in 1872, we witnessed a superb meteor-shower, with its radiant point in the direction in which the comet would have been moving.

VI.

When, as sometimes happens, a meteor is too large to be totally consumed in the air, it may fall upon the earth as an *aerolite* or *meteorite*. These have been seen to fall, and have been found, sunk a foot or two in the ground, at a scorching heat, with the surface molten. On such occasions we pick up direct messages from the far interstellar spaces where comets are born. We are then privileged to handle bits of matter that may once have been travelling in the regions where Sirius or Arcturus is now wandering. And we are able to examine and analyse them in our laboratories, and to see the kind of material that exists in some of those distant regions of space.

Here it will suffice to say that there are, broadly speaking, two classes of aerolites—namely, 'stone' and 'iron.' The 'stones' are largely composed of silicates, and very commonly they have a structure called 'chondritic,' utterly unknown among terrestrial substances. The 'irons' contain nickel also, and many have carbon, not only in the form of graphite, but also diamonds. Some are very pure iron, with less than 2 per cent. of nickel. It seems quite probable that Mexicans, Canadian Indians, Siberians, Senegalese, and Egyptians manufactured implements out of meteoric iron before they knew the art of smelting. Nordenskiöld discovered in Greenland numerous masses of this kind, nearly pure iron, up to twenty tons in weight, but doubts have been cast upon their meteoric origin.

There is a fine collection of aerolites in the Natural History Museum, South Kensington. The Strathmore meteorite is a splendid specimen in the Royal Scottish Museum, Edinburgh. It was seen to fall, and was picked up, on 3rd December 1917.

It has often been suggested that new, or temporary, stars may owe their brilliant outburst of brightness to heat developed when the star penetrates those masses of gas which we call true nebulæ, which are to be found scattered over the Milky Way, the very part of the heavens where new stars are always situated—a most remarkable coincidence.

VII.

NOVÆ OR NEW STARS.—Among all the wonders in the heavens, there are few so rare, so unexpected, so surprising, or so subversive of preconceived notions about an unchanging universe of stars as the sudden appearance, within less than twenty-four hours, in a well-known constellation, of a new star outshining all those that were in the sky on the previous night. Such a nova burst forth in the constellation Aquila, the Eagle, on the 8th June 1918, excelling everything of the sort recorded since the year 1604. About thirty of them, not all so bright, but all seen by the naked eye, have been recorded in history.

Hipparchus, the greatest of Greek astronomers, in the year B.C. 134, was so much surprised by a new star that he then set to work to catalogue all visible stars, so as to check them in future.

In 1572 the same thing happened to Tycho Brahe, the greatest practical astronomer who ever lived. His own words tell the tale: 'One night when I was examining as usual the celestial vault, the aspect of which is familiar to me, I saw, with unspeakable astonishment, near the zenith in Cassiopeia, a star of extraordinary brightness. Struck with surprise, I could hardly believe my eyes. To convince myself that there was no illusion, I called the workmen occupied in my laboratory, and asked them, as well as all passers-by, if they saw, as I did, the star which had so suddenly made its appearance. Its brightness could only be compared to Venus in quadrature. It remained visible in the day at noon.' It did not disappear completely until 1574. It is believed to be still visible in large telescopes, 'smouldering where it once blazed,' as a reddish variable star of the eleventh magnitude.

In A.D. 1604 Kepler and Galileo saw a nova as bright as Jupiter. Another bright one was seen in 1670, and no others till the middle of the nineteenth century, when, in 1866, a star of the second magnitude appeared in Corona Borealis.

Edinburgh can boast of a townsman, Dr Anderson, who has the unique distinction of having been the first discoverer of two brilliant novæ. He loves the stars, and habitually looks out of his window at them in the middle of the night, and 'calls them by their names.' As a result of this habit, on 1st February 1892 he sent an anonymous post-card to Dr Copeland, the astronomer, at Blackford Hill, imparting the astonishing information that a new star was shining in the constellation Auriga.

On 22nd February 1901 he was again rewarded for his patient watchfulness by discovering a nova in Perseus, equal to Algol, and the next evening exceeding Capella in brightness.

Needless to say, astronomers have attacked these surprise visitors, as well as other less conspicuous novæ, with all the resources of modern observatory instruments. In several cases novæ have been found depicted upon photographic plates taken on dates before the novæ were visible to the eye. Their great feebleness twenty-four hours before bursting into full splendour was thus established, and suggests the consumption of terrific energy to produce such a development of heat in so short a time.

The spectroscope, however, has been the most important instrument for this research, and the appearance of each new star, even minor ones, led to improvement in the instrumental equipment. So that in 1918, when the dazzling splendour of Nova Aquilæ (3) surprised us, nearly every great observatory in the world was well prepared to record the marvellous changes of spectrum going on from night to night during many months—even years. The results gained from Nova Aquilæ exceed in importance those of all previous novæ.

In 1866 Sir William Huggins's recently mounted stellar spectroscope told us that the outburst of light in Nova Coronæ was due to a blaze of hydrogen gas. But the spectroscope performs another function besides detecting the chemical elements. Here only the bare fact may be stated, marvellous as it is. The spectroscope enables us, by measuring the displacements of spectrum lines, to learn the speed with which a source of light, like a star, is approaching, or receding from, us. Thus, in 1892, Dr Anderson's first nova (the one in Auriga) told us, by spectroscopic evidence, that, compared with the hydrogen in that star causing the outburst, the other materials in the star were approaching us at the enormous velocity of eight hundred and eighty kilometres (or five hundred and fifty miles) a second. And a similar result has been derived from all subsequent novæ.

The conclusion to be drawn from this is, that the light of new stars comes from two separate parts that are moving relatively to each other, with the enormous velocities of hundreds, and in some cases thousands, of kilometres per second.

It is here that the analogy of meteors has come in. The shooting-star itself is in rapid motion, and the luminous trail is at rest in the atmosphere. The star and the trail would be inseparable in the best telescope if the distance from us were very great. They would look like one source of light; but the spectroscope would disclose their relative motion. It was, therefore, natural to suppose that, in the same way, a new star owes its sudden brightness to the friction of a star traversing a gaseous nebula, just as meteors owe their light to friction against the attenuated gases in our upper atmosphere.

The complete facts of observation offer considerable difficulties to the acceptance of any one of the theories that are still being discussed by astronomers. They may not be dealt with at present. And here, now, must end this brief account of the three kinds of surprise visitors among the stars: comets, meteors, new stars; a brilliant example of any one of which may reasonably be hoped for, if not expected, at all times.

THE BISON IN EUROPE AND THE CAUCASUS.

AT one time the European Bison (*Bison bonasus*), or Aurochs, as the Germans term it, was common throughout the Continent and in England, as is shown by the numerous fossil remains which have been found in association with those of the mammoth and the extinct rhinoceros. Its last refuge in Europe was the primeval forest of Bialowice in Lithuania, and here, under Russian administration, a considerable herd was maintained until the outbreak of the war. When, in 1915, the Germans took possession of that part of the country, the herd had been reduced to about one hundred and fifty, and steps were taken by the invaders to protect these in an absolutely wild state. With the departure, in December 1918, of the troops of occupation, the fate of the bison was sealed. Hardly had the last military train disappeared before the slaughter was commenced, and in September 1919 the last of the mighty wild bulls, famous in history, legend, and story, succumbed to the bullet of a poacher.

But although the bison has been exterminated in Europe, its near relative, the 'Circassian Buffalo,' still makes its home in the Caucasus. Sometime towards the end of the seventeenth century information reached Europe that there existed there in a wild state a kind of 'buffalo,' which, to judge from the description given, seemed to be identical with the bison of the Lithuanian forests. For a long time—owing to the political conditions—no confirmatory details in regard to this animal could be obtained, and as recently as 1836 the celebrated Russian Academician, Von Baer, expressed a doubt as to the existence of the bison in the Caucasus.

In 1860 the imperial protection was extended to the bison in the Caucasus as well as in Lithuania; and in 1870 it was estimated that there were about two thousand of these grand beasts distributed over an area of some three million acres on the northern slopes of the Caucasus and in the river valleys there. Dr Radde, the able director of the Tiflis Museum, puts the number of the herd in 1890–92 at about one thousand, and its area of distribution at some one million three hundred thousand acres.

A further step towards protecting the bison in the Caucasus was the letting of the sporting rights over this vast region to the Grand Dukes George and Sergius Michaelovich in 1894.

According to the statements of the Grand Dukes' hunting companions, Schilder and Luthau, and those of their head-ranger, it appears that the bison frequent the mountain-slopes and the almost inaccessible valleys at the head-waters of the Bjeleia, Seleutschuk, Uruschtem, and other rivers. Generally they are found in small groups of five or six, rarely as many as fifteen, among the ancient pines at heights of from five to eight thousand feet above the sea, descending to the wooded valleys only when the snow has become very deep.

Although heavily built and unwieldy-looking, the bison is extremely active in its movements, covers the ground at a great pace, and can climb without difficulty steep precipices. It is also very wary, and its senses of smell, sight, and hearing are excellent.

Schilder gives the length of the Caucasian bison at nearly ten feet, and the breadth of its forehead at the base of the horns at about eight inches only, while its Lithuanian relative measured from twelve to thirteen inches between the horns.

Not until September 1895 did the Grand Duke Sergius succeed in shooting a bison on his Kuban hunting-grounds; and his friend Schilder, with the Cossack Tschepumov as *shikari*, killed a bull and a cow after a most exhausting experience. Both these animals were sent to the Zoological Department of the Imperial Academy of Science.

In 1897–98 the grand-ducal hunting-parties shot, in the country round the head-waters of the Laba, Umpyr, Uruschtem, and Kischa Rivers, four bison, forty-two red deer, eight steinbok, seventy chamois, four bears, and one wild boar. In three months' hunting in the Caucasus in 1887, and a similar length of time in 1888, the well-known English sportsman Littledale failed to get a single bison; and not until 1891, when accompanied by a famous native hunter called Labasan, did he succeed in shooting a bull at a salt spring on the Kischa River, and some weeks later a cow. Both these animals are now in the British Museum.

After 1890 the accounts received in Europe with regard to the Caucasian bison became very meagre and unsatisfactory, and it was arranged that a specialist should be sent out in order to obtain the required information on the spot. Accordingly the Russian zoologist Filatov, at the instance of the St Petersburg Museum authorities, made three journeys to the Kuban region in 1910 and 1911. From the chart which he drew up, it appears that the area of country then inhabited by the bison was about thirty miles in length from east to west, and about twelve miles in breadth from north to south; but in spite of the most diligent inquiry, he was unable to arrive at any definite conclusion as to the stock of these animals still remaining. In his report to the Academy he wrote that their numbers could hardly be less than one hundred or more than one thousand—an extremely vague estimate.

SEVENTH SERIES

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

PERIODS seem to recur when the newspaper press produces a quick succession of entertaining and even important news from its own inner corporation; we have lately been passing through such a period. Newspapers are so much a part of national and individual life in our time that the general interest of such affairs need not be discussed, nor the importance to the world, in these hurtling days, of the daily journals and what most concerns them. And so much of a close community, for all its lack of barriers and hedges, is the world of journalism that all of long and intimate experience in it seem able to join a personal association with each event. For example, three of the greatest newspapers of the world have just been making honourable celebrations of their own. One of the most powerful organs of public opinion outside these islands is the *New York Times*, which has issued a history of seventy years of its careful and vigorous effort. That effort has been of good consequence, and its fascinating story appeals to one who, long ago, had the occasional experience of writing in its offices in New York. Nearer home, a very great journal of which England is properly proud, the *Manchester Guardian*, recently commemorated its centenary, and one must needs have kindly remembrance of how the very rudiments of journalistic knowledge were imparted in the days of youth by an old member of the staff of that great school, and of his immediate injunction at the first lesson upon the wise observance of the golden rule, 'When in doubt, leave it out.' And the *Morning Post*, veritably a glorious upholder of the best traditions of British journalism, has celebrated its hundred and fiftieth year, while at the same moment a new morning paper was coming to life in London. Along with these and other events there have been two more of a different kind that have aroused acute remembrances. One has been the publication of a biography by Mr J. Saxon Mills of Sir E. T. Cook, who, not long since passed away, was editor in turn of the *Pall Mall Gazette*, the *Westminster Gazette*, and the *Daily News*, and the occupant also of various important offices. The other was the more recent demise of Mr Kennedy Jones, one of the strongest figures in the pioneer movement of what is known as the new journalism. The conjunction of the publication of this life-story of Sir Edward Cook and the passing of the remarkable figure who was best known as 'K. J.' forces a number of thoughts, and perhaps some strange comparisons.

* * *

Many columns, a vast extent of thought and attitude to existence, separated the conduct and the kind of sensibility of Sir Edward Cook and of Kennedy Jones in the labour of their lives, which was with newspaper production. One who knew them not by their works only—having some professional occasion to consider continually what they were doing and had done, and wished to be done—finds it a severe exercise in imagination and discovery to picture two other men engaged with the utmost distinction and success in the same profession, though in vastly separated ways, between whom there was such a contrast. They were both journalists. Were an authoritative history written of the great, throbbing, adventurous period of the start and advance of the new journalistic era—which some would call the romantic and others the golden, neither description being good or satisfying—much prominence would need to be given to the labours and the characters of these two men, who were both strong influences; and it would be according to the disposition of the author or compiler that one or the other received the better show in his pages. Yet there seemed to be a civilisation between them. K. J. was the materialist, who told Lord Morley once that he, the speaker, and his kind had made of journalism a branch of commerce! Lord Morley himself had laboured editorially at the *Pall Mall Gazette* office shortly before the opening of that transforming era, which might be said to have begun about the time of the Diamond Jubilee, or a year or two earlier, and assuredly he had never had a thought of being thus engaged in any branch of commerce—nor was he. This is not to say that Kennedy Jones had no proper sense of the moral responsibility of the work, for he had the sense, and in his own way at times exerted it; but still he was materialist, and his ambitions were mainly associated with the adventure of his great pursuit. Sir Edward

 [*All Rights Reserved.*]

Cook was not a realist like the other, but idealist, almost romanticist in a sense, a philosopher, a lover of good and beautiful things, who pleaded always for sincerity and effort for the good of man. He was not concerned with 'beats' or 'stunts,' or even headlines; it would have mattered nothing to him if he had never seen or heard of such things again, except that the world of journals would have seemed the better for their going, and the cleaner too. Strong and material was Kennedy Jones, fine and spiritual Sir Edward Cook. The contrast is not without a certain interest and importance at such a time in the world's affairs as this, for these two men may seem in an unofficial way to have represented two great opposing forces in the furious development amid which we live and are tormented. A person who has had more than a quarter of a century of intimate and absorbing association with newspaper-life in London and various foreign capitals, and who became closely acquainted with these two men in the closing years of last century, when each was at his best, and was, with bright vision, straining towards his ideals and ambitions, feels this comparison to be strongly emphasised now. They hardly knew each other, though they once laboured in adjoining streets; but that is nothing. Sir Edward Cook was the first to pass from life; he went quietly away. He had withdrawn to some extent from the newspaper arena; during a part of the war period he was in control of the press censor's department, and that was almost the last we knew of him. Fleet Street makes no mournful scene when its heroes pass; its efforts in all ways are too much exhausted with the world outside and those who people it to bestow adequate or even decent attention upon its own affairs, which are often left dusty and neglected. Of course, Sir Edward Cook was served with obituaries, and he was invariably praised; but yet the people are not trained to fair appreciation of all the chiefs of journalism, who may, and often do, possess more power than chiefs of Governments, for they address the community at large in a deliberate and well-considered way, and they have the advantage of being more fixed in their situation than the best of Ministers with their insecure tenure. Sir Edward Cook in his time was a power, and he would have been one of the last to be a really great political power as a leader-writer if it were true, as Kennedy Jones continually and vehemently asserted, that the political power of the press through its leading articles was declining to nought—in which he certainly exaggerated, for the error here has been well demonstrated in recent times. But speaking thus in conjunction of editors and Ministers, one is inevitably reminded of the curious circumstances—as now they seem—of one's first meeting with Cook, who was then editor of the *Daily News*, at that time a power in the land, and living its last days in its old and substantial Victorian form. A little while before, being then but young in London, I had met Mr Lloyd George, who was trying to be as energetic in Parliament as a very young and scarcely known, but highly ambitious, member might be, and at a club one day he had explained to me a scheme in which he and others were closely interested, one that had something to do with the establishment of a council for regulating the political action of Nonconformists. He suggested that it would be a good thing for everybody if a strong article, preferably in the form of an interview with a distinguished mutual acquaintance who was keenly interested in this movement, could be got into the *Daily News*, and he submitted that the writer was the person indicated for the business. I laid the proposition before Mr Cook, as he then was, and he asked me to visit him at the office in Bouverie Street and discuss the matter. I saw him on two or three occasions about that time, and the article was inserted, Mr Lloyd George and our distinguished friend declaring themselves highly satisfied with what appeared. Those who thus came into contact with Cook at that time bear with them now a happy remembrance of a delightful gentleman of an easy, tranquil, and courteous manner, a pleasant and cultured personage, a really gentle man. In the building at the same time was the managing chief, Sir John Robinson, another great figure in the newspaper world of that period. On my being taken into his office for an introduction to him, he immediately constructed a close, cheery assembly of the three of us, standing up at the fireplace, and, according to his invariable custom, proceeded instantly but naturally to delightful anecdote, springing from the personal experience of a life rich in adventure and acquaintance. It was something new about Thackeray, as he had known him, that he spun off for us at the beginning.

* * *

What days were those—not Thackeray's, but ours—in what some have called the Street of Adventure! Kennedy Jones himself reminded us of what, I think, is the greatest and at the same time most peculiar emotion of its class that is possible to the human worker—a certain sense of creation, achievement, of the finality of a stage, and of having stealthily and in the night-watch let loose a power upon the world—let loose, indeed, for all the efforts of man and editors, proprietors with them, cannot, as is known, effectually control a new newspaper in the matter of its form, manner, and characteristics, whatever they may do with its opinions. They try, they juggle and experiment with shapes and features, but somehow the new sheet, like a wilful child, will insist on shaping itself. He told us of the great moment of his life when, after long preparation, the *Daily Mail*, a revolutioniser, came to its first printing. On a perfect

morning in May, the sun shining just at the break of day, he walked home after twenty consecutive hours' work at the office with the printing-machines burring away happily; and in the afternoon he walked back again, after the brief rest following the consummation, to be told by his prime associate, Alfred Harmsworth, that the signs indicated that they had struck a gold-mine. Many old journalists who have been in the thick of things know that walk home following upon the night of the creation; it is as a unique and thrilling remembrance of a certain state of ecstatic tranquillity which cannot be matched. This humble deponent of the present twice experienced it in London in that same era—once in earliest days, when a new Sunday newspaper was given forth, and there was just the same walk home on a lovely sunny morning of spring from a by-street off the Strand to the domicile in Russell Square; and again, not long afterwards, when the experience was shared with Kennedy Jones himself. It was just after the Sunday paper was launched that Mr Harmsworth (and who can forget the sense of terrific energy and initiative that possessed those men in those days?) invited me to see Kennedy Jones with a view to working with him, and not long after such a connection had been established a Sunday *Daily Mail* was first projected, another daily newspaper in London having determined upon a similar scheme. Kennedy Jones, who was in charge, asked me to go with him to assist in the control of the special news department. But public opinion was against such Sunday enterprises at that time, and after a suggestion by Lord Rosebery that the particular rivalry that had engendered it might, to the satisfaction of God, be abandoned, both were stopped. New journals are plentiful in these times, but one feels a doubt as to whether the thrills are just the same now as they were then. Fleet Street, for all its tearing energy, so tremendously organised as it is now, and overcrowded too, seems sometimes to the men who knew it a generation back to be a little jaded or confused. A few months ago, in a Scottish twilight, I was motoring back from the golf-grounds of East Lothian to Edinburgh to catch the night-train to London, and my host of the occasion was he who was chiefly concerned as leader in the great adventurous enterprises of those days, and who had called me to London from a small editorial chair in a midland county. More than twenty years had gone by since such a beginning, and there was the mood and the circumstance for reminiscence. I said that surely those palpitating days were the romantic age of journalism. He did not dissent, but remarked that there were great days now as well. 'But,' murmured the old associate, 'beats, scoops, and all other things that made up the thrilling joy of that life are surely not the same things now; they do not count so much. We did not think then that we were striving for the money, only for the joy of the straining effort.' 'Oh, but there are beats now,' Lord Northcliffe responded. 'Why, there was my interview with President Wilson in Paris the other day, and was that not beat enough?' he asked. 'Well, but don't you agree that that was the greatest age?' I pressed. And he answered after a pause, 'Yes, no doubt it was; but don't forget that we were younger then.' Perhaps that was it.

* * *

In those happy days the men of these affairs took no thought of the morrow; sufficient for the day was the paper thereof. It happened that on the last day I saw Kennedy Jones alive we turned back to reminiscence in a similar way. The meeting was casual, in a Westminster thoroughfare. I had just returned from the Mediterranean, and he was walking to the House of Commons. He asked me what I had been doing in Spain, and immediately he spoke of the starting days, in the way that men will talk who, after intimate association in great events, had not met for long, and, oddly in a way, asked me if I were sorry for that association and that new beginning. Kennedy Jones had had the reputation of being a hard man, and of having crushed the hope out of many young journalistic adventurers who came his way; but he used to say, and it was true, that if ever a young writer went to him, he would at least give him one chance—and it was left with the man to do the rest if he could—out of bitter remembrance of his own early days in London when, appealing for work, he found the doors of the old-fashioned newspapers slammed against him. He always acted upon that rule; a man could always have one chance in the great machine that was then attracting the attention of the whole country, and of other countries too. It was a trial of a month at a fair salary. If he failed in the month, it was the end; if he did not fail, there were great possibilities before him. Those who saw him in those days—which appear more and more romantic for the memory—had to climb a rickety and dangerous staircase in Whitefriars Street, and they encountered the new genius sitting at a little desk in an anteroom which was hardly more than a cupboard, was stacked with papers, and contained no furniture beyond a small desk, the chair upon which sat the genius, and a sofa which was short of a leg, and was supported in that corner by *Webster's Dictionary*. I remember it. In what palatial chambers did Kennedy Jones afterwards recline! This Scot, as he was, with the hard, strong, bulldog face, who hurt the feelings of some of his distinguished contemporaries by insisting that journalism was just a trading enterprise, a branch of commerce, was

posing a little at times in making these assertions, though some truths were contained in them. He had, indeed, himself developed and exploited the commercial side of the subject perhaps more than any other man in Britain, and had gained from it accordingly. His own stories of his various efforts and achievements in organisation exhibited his splendid powers of exploitation. But yet he himself at other times declared that this affair was a great science and nothing else; and as one observed this man watching and studying every minute and every hour the psychology of the public, the fleeting changes that were made by circumstance, peering at the signs of earth and heaven so that the very circumstance might be anticipated, reckoning the associated chances of human nature with the world, necessity, and materialism, surely science has it for description—with yet a little flavour of art and literature. It is because this 'science' calls upon the human faculties in so many different ways, and at the same time demands a high efficiency, and speed with that efficiency, and what we might call potential omniscience with the speed and the efficiency, working always through human life and conduct as its medium, that it seems sometimes to embrace all other professions and sciences and callings, and, again, to need a little more than the combined efficiency of them all.

* * *

A thoughtful journalist of much authority, who has been engaged in this 'science' all his life, and with distinction and success, insisted in conversation the other night that, considering the term 'journalist' in its wider sense, relating to the man with the complete instinct and ability to do all things in emergency, and do them nearly as well as possible, as against the brilliant leader-writer, the sagacious foreign correspondent, or the successful organiser, or editor, none of whom is in himself alone a complete journalist or entitled to be ranked as one of the greatest, there were fewer great men in this department of life and labour than in any other. He believed there were not more than half-a-dozen in the topmost class. A rich man may gain a kind of reputation for being journalist, and big journalist, of a kind, by the simple but expensive process of buying a journalistic property or establishing one and getting others to do the work for him. It is a splendid thing to be thus the controller of a great newspaper, but it is a costly acquirement. Kennedy Jones said that if he were to start a new daily newspaper in London, he would want not less than half a million pounds to spend upon it at the beginning; and this was, if anything, an underestimate, and was allowing something for his unique talent. As a matter of fact, such an amount has been spent on the process in comparatively recent times, with blank failure and a short life as the result. But it can be done by those who pay the price, and the proprietor then, especially if he sat some nights in the office he controlled, might be considered in some places as a journalist. Kennedy Jones, however, was a vastly greater journalist than that, even though I do not think he could have written of a great event finely, as we would say, with any literary distinction and flavour, in any circumstances, though one should add immediately that he would write entertainingly—and that is the chief thing for most journals. He had an acute sense of colour in words as well as objects. He would say that some words suggested bright colours—they glowed and were attractive; others were old, dull, and gray, and therefore he ordained a system of using only the colourful words in headlines to articles, and never the gray things, which were abolished for such purposes. Here are intuition and truth, the genius of a journalist. But, first and last, Kennedy Jones was an organiser and little else, though an editor with an enormous instinct or nose for news. His achievements were in organisation, and to-day journalism is an affair of organisation. There is nothing in life and commerce that is such a very perfection of organisation. For, whatever happens, the newspaper must be presented, without excuse, at the proper time each day. It is as a companion of the dawn. And so the wonder and the mystery of it all.

MAN'S WORK.

CHAPTER V.—*continued.*

IV.

THE car moved forward, disappeared in the valley, halted a moment at the Enterprise property, and slid back towards Los Angeles. Shanklin was looking after it when Harrison's voice sounded at his shoulder.

'The women looked good to me, but what did you make of that fellow?'

'I'd hate to say.'

'That's the way I feel. You noticed they stopped down at the ranch?'

'Yes.'

'Well, I'll bet he's the chief push in the game, and never did a stroke of work in his life. Sort of chap who lives on folks like you and me.'

Shanklin shook his head. 'Not that one,' he said with conviction. Then his thoughts turned to Claudia, and he got a glimmering of how

things stood between her and these strangers. How much or how little, he wondered, did Claudia know?

This was the question that sharpened itself in Edith Winter's brain on the way home. The two had been instinctively drawn to each other at first sight. But she had begun to make a differentiation, however slight, between Claudia and her husband. Her mother's impulsiveness made the girl think in a new way about her inheritance, and Sitwell had been a little too ready to fan the flame of enthusiasm. Then that quick whisper from an unknown workingman in stained clothes—the man in *Marcus Aurelius*—whom Sitwell had described as disloyal. The eyes were not disloyal; in fact, it was the kind of face one might suitably find in *Marcus Aurelius*—honest, open, and fearless. She was caught up in all this, and it imposed on her a silence that Sitwell, noting uncomfortably, tried once or twice to break, but with small success.

That night Edith sat on her mother's bed and said what was in her mind. It was the first time she had asserted herself in any determined fashion, and the sound of her own voice, the strangeness of her surroundings, and the events of the day all combined to give her a sense of unreality.

'It's my turn now, mother,' she began, 'and I'm going to take it!'

'What's the matter?'

'Nothing yet that can't be put right; but I feel that this thing has gone far enough. It's all very well to keep some things from Jim, and make up your mind to surprise him; but suppose it's we who are surprised, and disappointed, and perhaps worse. We shouldn't have come out here at all; but now we are here, let's make the best of it.'

'You'll settle my chance to make a fortune for you both if you're not careful.'

'I've settled on several things,' was the quiet answer. 'And, mother, it's no use protesting, for they are going to be done. You've got oil on the brain, and I haven't. First of all, we're not going to buy any stock yet.'

'Then we'll be too late—it will all be gone,' broke in her mother. 'Mr Sitwell was speaking of that on the way in.'

'I don't believe there'll be any difficulty at all: and,' the girl added shrewdly, 'there are probably lots of other things just as good. The second point is, that I'm going to telegraph Jim to try to get two weeks off and come out here.'

'And take the chance of losing his new position!' Mrs Winter was startled. Also, she wanted very much to do this thing off her own bat.

'He won't lose it, if he goes about it the right way, and I might lose everything if he doesn't come. The third thing is, that we mustn't stay here a day longer than we can avoid.'

The older woman looked up helplessly. It was a very luxurious bed—in fact, the bed of the late Courtney Brooks, who knew what he wanted in the way of comfort. She liked Claudia, and was impressed by Claudia's husband and their joint kindness. She had made up her mind about investing in the lake of oil, whose black depths were almost visible to her trusting eye. And now Edith proposed to upset the programme. There was a curve on the girl's lips she did not fancy. The girl noticed her expression, smiled cheerfully, and went on.

'The Sitwells are awfully kind, but it's queer, our being here. We accepted, because we thought there was nowhere else—but there was. I've been looking at the papers.'

Mrs Winter began to feel disturbed, and made a little gesture. 'It's on your account we came out here,' she said pointlessly. 'I want you to be a rich woman, if you'll kindly allow me to make you one.'

'And it's on both our accounts that we must be very careful. Don't you feel it yourself? Just assume that Mr Sitwell was not a bit interested in us—only in our money. Do you think,' she added with sudden insight, 'we'd have been asked here if we had only five hundred instead of twenty thousand dollars to invest?'

'Edith,' exploded her mother, 'you make me feel as though I'd no right to be in this bed.'

'That's just what I wanted—you haven't; but you'll have to stay in it to-night. Then we can move. I'm going to write to Jim, and to-morrow I'll wire and tell him I've written. Good-night, most impulsive of mothers, and don't dream about that lake of oil. There are lots of things to do till Jim gets here.'

Edith sat up late, finding it a difficult letter to write. It seemed at once that the Winter family had acted too precipitately, so she gave neither names nor details, merely stating that she and her mother needed advice about an investment. She had been impressed by the magnitude of all she had seen. It needed, therefore, the best judgment available. She was a long way from home—a little frightened—she admitted to having been too impetuous, and grasped at every possible security. Her first instinct was to send for the man she loved.

'I won't let mother do anything till you get here,' she wrote. 'We'll make a trip to Catalina, and perhaps to Santa Barbara. Address me at General Delivery, and come just as soon as you can to advise a girl who needs you very much.'

(Continued on page 151).

VOYAGERS OF THE TWILIGHT.

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals, Tracks and Tracking*, &c.

I.

PAUL ALBANY was on his way to Villamer for his quarterly carousal, when, passing Berwick Hobert's cabin, he saw a white flag fluttering forlornly from the chimney-pipe. Paul had no special use for Berwick Hobert, but such a sign could not very well go ignored by a next-door neighbour here in the heart of the uncivilised foothills, so Paul readjusted his course, and steered for the valley. A few minutes later he dismounted and corralled his cayuse at the squatter's abode. Just as he was about to enter, an apparition of white fangs and bristling mane leapt from under the cabin, and Paul was all but sent spinning. He whipped out his revolver and used it with deadly intentions, but Berwick's dog was too quick for him, and managed to regain the security from which it had so suddenly emerged, while the bullet splintered the woodwork.

Paul went in, mopping the blood from one cheek, where the dog had clawed him. Berwick lay in his bunk, clearly a sick man, gazing up with wide, glazed eyes.

'The blame swipe bit me!' muttered Paul indignantly. 'A nice greeting for any one who comes along to see what you want! Why didn't you shout to me to look out for the dog?'

'Didn't know you were there,' replied the other. 'Sorry he's bitten you; but I'm glad you've come along, Albany.'

The visitor went over to the scrap of mirror to examine his wound. It was hardly skin-deep. 'If I'd known the cuss was there I'd have given him a pill!' he muttered savagely. 'When you hang out a white flag, why in thunder don't you keep the dog tied up?'

Clearly Berwick was not feeling in proper shape for a scrap. 'Oh, quit it, Albany,' he entreated, 'and get me some water. Truth is, I've got a touch of the sun or something, and been on my back three days, feeling like nothing on earth.'

Paul stumbled ungraciously round in search of the bucket, and tossed its lukewarm dregs through the door. At the threshold he paused and looked back, one hand on his belt. 'If that cuss comes for me again—I'll fix him!' he said viciously; at which Berwick struggled into a sitting position on trembling elbows.

'All right,' said Berwick; 'leave the bucket there, and I'll creep out for the water to-night, same as I did the night before last. Yes, creep on all fours, what seems like a thousand miles, and to hell with you!'

Paul Albany glared a moment, then remembered that he was talking to a sick man—an almighty sick man. 'Shucks!' he muttered, then slammed the revolver on the bench and took up a club in its place. Five minutes later he was back with the water, filled a cup, and gave it to Berwick. Berwick drank feverishly, but in silence, and handed back the cup.

For ten minutes Paul kept himself busy getting things ship-shape and giving Berwick a new start, at the end of which time he broke the silence by saying, 'Anything else you want, before I go?'

Berwick rose from his stupor with a start, and again looked at the other, with injury and contempt in his gaze. For a time he was silent; then he said, 'You're my only white neighbour within forty miles. I thought maybe you'd stay along of me a day or so, till I've taken the turn.'

Paul turned his back. He did not like Berwick's eyes. 'Sorry, I can't,' he answered. 'I've got important business in Villamer—must be there to-night. I'll come back to-morrow, or send one of the boys along. You'll make out all right till then.'

Berwick thought. He knew that to-night and to-morrow also Paul Albany would be roaring drunk. That Paul would not return was certain; that he would remain sober long enough to impress upon some one else that help was urgently needed was improbable.

'I'll pay you, Albany, if you'll stay,' he said, with quiet earnestness. 'It may seem nothing to you, but I tell you—I'm pretty well all-in, and can't get on much longer alone. Name your own price and—I'll pay you!'

Paul's back was still turned. 'Nope,' he answered. 'I'm going to Villamer, as I said. No one asked you to come butting around this range, and you've got to take your chances, same as any other son of a gun!' He paused a moment, but Berwick did not interpose. 'I reckon I've left everything handy,' Paul said. 'If there's anything else you want, shout out now.'

'Yes, there is,' said Berwick. 'I'd be grateful if you'd feed the dog. He hasn't had no grub since I fell sick, which maybe has made him kind of fierce. There's some meal on the shelf.'

Paul prepared the food, grudgingly and in silence, as he had done the rest, and placed it under the bunk.

'That all?' he queried. 'Reckon you can make out now?'

There was a moment's silence, and then, 'Yes, I can make out, Albany. I reckon I can make out without you. But there's one thing I'd like to say before you go; that is, hell's full of men like you. Maybe you're leaving me

to die; maybe you ain't. That don't matter; but some day, when you're all-in, and dead up against it, perhaps you'll know what it means to be left—alone! That's all!' And the sick man turned his face to the wall.

A minute later Berwick heard the thud of retreating hoofs, and once more the dreaded silence closed in upon him.

Skilko, the dog, came out, and fawned up to the bunk. He was a rough-coated, long-limbed creature, in whose composition many breeds were evident—Scottish deer-hound, bull-terrier, and Airedale predominating. He was not a pleasant dog to look upon, but as he gazed up into his master's face at that moment, and one saw only his eyes, it did not seem to matter much what breed he was.

'Skilko,' muttered Berwick, 'there's grub for you! Look, boy, grub!'

Skilko stared at the bowl, then backed away from it, baring his fangs. What was in his mind we cannot say. He was hungry, Heaven knows; but Paul Albany was the professional wolf-hunter of that range, and the hands that mixed the food were reputed often to sin against the law by mixing poisoned baits, scattered broadcast for the wolves. There was no poison in that food, yet Skilko would not eat it. 'Because,' muttered Berwick—'because it's mixed by filthy hands which I—and you, Skilko—and God—don't approve of!'

And Skilko sat, knowing that he was needed, yet knowing not why, till the day merged into dusk, and he shivered a little with the cold. Yet rigidly he sat, patient as a woman at the shrine of one she loves, forgetful of self in a worship all-absorbing, all-pervading, while without, through the great gray loneliness, something was ushered in, something in whose presence Skilko stood the merest atom of a slave, as all living things are slaves. Yet before that Infinite King Skilko shrank not, knowing himself to be a faithful slave, till the still, cold hand upon his forehead told him that his vigil was ended. Then he rose, to steal through the open doorway, and to pour forth his soul to the stars in the cadences of a dog who has lost his master.

II.

When, a few days later, the rangers approached the cabin to do what was to be done, they saw what seemed a large coyote sitting on a near-by ridge and watching them. One of them took steady aim and fired, at which the beast whined and speedily vanished.

Going up to the cabin, the men found coyote-tracks everywhere—round the walls, on the roof, at the very threshold of the open door. Here, at the threshold, the coyotes had evidently been fighting, for the ground was all ploughed up, and there were tufts of fur; but inside the cabin there were no signs of the raiders. The dead man's food lay at his side; under the bunk, still untouched, was a bowl of dog meal.

Then it was that understanding came to the rangers, and the one who had fired the shot looked remorseful. 'His own dog!' they said. 'Stood by him and fought off the wolves! Starving himself, he wouldn't touch his master's grub. Say, that dog's a little hero!'

They went out and called, but they saw no more of the creature at which they had fired. Skilko, as a matter of fact, had been a one-man dog all his life. There was never any special reason why he should regard the rest of humanity otherwise than with feelings of sullen distrust. Born an Indian dog, to him the memories of puppyhood were not of the sweetest, and since then he had lived alone with Berwick, far remote from camp or trading-post. When Berwick visited Villamer, he had always left Skilko at home to guard the cabin from the coyotes. Skilko had never seen a white man's settlement.

Thus, intimate only with one man, loving no other, Skilko's impressions of the remainder of humanity were strengthened by the incidents just described. First, Paul Albany had crossed his trail, and him Skilko knew. Paul was at war with the wolves, and since Skilko had lived his leisure hours much as the wolves lived, he regarded Paul as the wild wolves regarded him—an element of evil in their midst. And Paul had fired at him—tried to take his life!

Next came the rangers, and they, too, had fired at him; so, stealing away from the scene of such sad memories, Skilko took with him the impression that, now that he was alone, dependent on his own resources, he moved in hourly peril of his life, a forlorn and friendless dog in an unfriendly world.

Hitherto Skilko had hunted as a hobby; now, sick with hunger, he hunted for a living; and for the most part, during the days that followed, he lived by pouncing mice out of the prairie grass.

One evening Skilko, by good luck rather than good judgment, caught a jack-rabbit, which was fleeing in blind panic from one of its own kind. He was not hungry at the time, so, having eaten a little of the catch, he covered the rest with grass to hide it from the birds, and went his way.

Next day, coming back, Skilko found the hare as he had left it, but all about the place was the scent of man—the scent of Paul Albany, who had fired at him! Full of deadly suspicion, Skilko sniffled the meat, and learning that the man had in some way tampered with it, he scraped earth upon it, growling thunder, and trotted off stiff-legged.

Then Paul Albany, lying on a distant ridge, closed his glasses with a click, and cursed. 'It weren't a wolf at all,' he muttered, 'but old Berwick's dern dog! Dern that dog!'

Paul had reason to 'dern that dog,' for all last winter Skilko had paraded the range, as bad as a wolverine on the trapping-ground. It was chiefly owing to the dog that the prevailing spirit between Paul and Berwick had not been of the best; Paul's threat to poison Skilko had brought about a lively exchange of sentiments between himself and the dog's owner. And Paul had not possessed a leg to stand on when Berwick pointed out that poisons were illegal, and that he himself was in no way bound to chain his dog because some low-down son of a gun had chosen this particular range as his trapping-ground!

But all that was when Skilko had his man-master and was in no way dependent on his own resources. Now Skilko was free, free as any wolf of the prairies, and compelled to hunt for his living, he was calculated to prove a far more perilous rival than hitherto. Well Paul knew that Skilko was familiar with each and every one of his present sets; the dog had already marked every one of them with his personal sign of contempt, and Paul possessed little originality in the way of devising new sets to meet exceptional conditions.

A few nights later Skilko's keen nostrils led him up-wind, and as he progressed at an easy dot-and-carry-one, the heavenly aroma of dead calf increased in its seductive potency. He topped a ridge, and his nostrils told him that there, in the purple hollow ahead, the feast lay, while on the farther skyline he saw the skulking forms of many coyotes. He paused in his stride, then trotted on, stiff-legged and bristling, terrible to behold, and as he went he uttered a deep bass roar—it was not a bark, nor yet a growl, but something between the two. Our domestic dogs do not utter this sound, which is perhaps just as well, for it is a sound intended to terrify—to signify some immense and terrible personage to those who cannot see what is coming.

The coyotes heard it, and yapped their derision. They were swifter than any wolf, so did not care, but, nevertheless, they drew no nearer to that monstrous tempting bait. Skilko trotted up to within ten paces of it; then he paused, froze in his stride, for the same reason as that which had caused the coyotes to dally in the offing. About the place was the scent of man!

Skilko was a thousand times more fortunate than the wild wolves, in that he had learnt from man himself the meaning and the setting of traps, in addition to which he possessed many of the instincts of the wild wolf. Now he swiftly nosed around, and discovered each one of Paul Albany's sets. And all in turn he marked with his sign of contempt, ere scattering earth upon them; and the wild dogs of the hills, seeing the signs that he had left, would heed the warning, and add to Skilko's signs those that were sacred to themselves.

Thus, when Paul came next morning, he found that yet another of his choicest sets had been spoilt, and the signs in the sand—the tracks of a dog smaller than a wolf and larger than a coyote—conveyed the tidings as to who was the spoiler.

This was but the opening of the feud, and it would be wearisome if I were to describe how, that autumn, Paul Albany found set after set laid waste by the wild dog of his range. He put it down to some devilish and personal spite on Skilko's part towards himself, for he did not realise that that kind of evil disposition is peculiar to man himself. Paul by now had rather accusing sentiments as concerned Skilko's late master.

Bit by bit the idea grew that the ghost of Berwick Hobert was working its vengeance through the dumb friend that Berwick had left behind. At times, finding some new indication of the dog's cunning, Paul would tear his hair and rave, swearing that the varmint would be the death of him. He lived alone, you see, with the great gray loneliness, and he was not a very temperate man. At other times he would scoff at his own superstitious fears, and, full of boastful confidence, he would sally forth, till again, in the cold gray of the morning, he found his choicest sets betrayed, and again he would turn to curse God and all Creation.

III.

So Paul Albany's morbid fears grew with the growing of the pile of empty demijohns by his cabin door, till, early that winter, he again visited Villamer, and there told an old trapper, a man of originality, of this 'wolf' of exceptional cunning 'who means to get me down.' There were maudlin tears of impotence in Paul's eyes as he told his story, and the old man, seeing that Paul was 'up against it,' told him of a set he had never known to fail. Paul went back with hopes revived, scoffing at the ghost of Skilko's master; but on arriving at his cabin, he found his stores laid waste and the whole place a chaos of disorder.

Clearly this was the work of a pair of coyotes, but Paul did not pause to examine signs; or, seeing them, he was blind to what they might have told him. Berwick Hobert's ghost was 'getting him down,' and this was another step in that direction. He felt that he was striving against the inevitable; yet, a fighting-man, he would fight to the end. Underfed, poorly clothed, his whole limited intelligence centred upon one purpose, he began to watch for the coming and going of Skilko. At the end of two days he had obtained the essential information. He had learnt that Skilko, when he had to cross a certain creek, frequented always one crossing. The creek was frozen, save for its very centre, while the water moved with the metallic tinkle of extreme cold. In the centre of the unfrozen

stretch was a single stone, an island in mid-stream, which Skilko tapped with his paws as he leapt across.

Paul, trembling with weakness now, waded up the running water, so as to leave neither scent nor sign, removed the stone, built in its stead an island of moss, placed on the moss a No. 4 wolf-trap, which again he covered with moss; then over all he littered a coating of snow, leaving the island, outwardly at least, just as he had found it.

That dusk Skilko set his feet to cross the creek at the old familiar crossing, and fell to Paul Albany's trap.

At about the same hour the prairie wolves, this being the dawning of the Hunger Moon, unearthed what remained of Berwick Hobert; and one of them, one of the two that had raided Paul's cabin, set off again in that direction, carrying its sinister trophy. At the threshold it dropped what it was carrying to sniff beneath the door; then, finding that the man was back, it fled in abject terror.

Thus Paul Albany, going out next daybreak, saw something white at his very feet as he opened the door. It was a skull, a human skull, grinning up at him—the skull (something told him) of Berwick Hobert!

Paul flung his hands to his eyes, and staggered away from the horrible place, never to return. He was mad now. Some delicate fibre of his brain, long strained to breaking-point, had at last yielded under the load. He had no snow-shoes, no parki, and he did not see the dense black blizzard sweeping up from the north-west. On he floundered, through the drifts, rising, falling, clutching at the snow with crooked fingers—cursing, praying, even laughing—yet on, feebly on, till the fury of the storm smote him.

Then understanding came to the soul of Paul Albany. He was dying, and he was alone! Berwick had told him so—Berwick had attained his end!

Obeying animal instincts, Paul crept into a hollow, and banked the snow around him. No living man could have faced that devilish fury of ice-particles, and, alone with the whiteness, with the shrieking, howling fiends of death whirling in a mad dance of mockery about him, he paused, his terrors for the time forgotten, to think—to wonder! He looked at his own hands, watched the movements of his fingers, and for the first time in his life he began to respect and to wonder at this beautiful and much-abused body of his. Yes, and soon he would be so much clay, like Berwick Hobert, whom he had left to die—alone!

Yet, as the seconds passed, the thought ceased to trouble Paul Albany, for his soul was wrapt in a new wonder—a wonder at the things God had made—the snow, the storm, and again himself! If this was death, then life was a thing less merciful! He knew that he was dying; already his lower members refused to obey his will. Yes, he was dying, alone, yet he was not afraid, for he knew that of which the living are never certain—that hell is left behind with the leaving of life.

Then again understanding came to him—Berwick Hobert was not unkind! How could any man be unkind after his eyes were open—after he had crossed the Great Divide, which he himself now was crossing? Unkindness belonged to the living world. It is an element that does not belong to the world beyond. Paul no longer belonged to the living world. That, thank God, was gone for ever. He belonged to the world beyond the living, and his eyes were open.

Yet he was alone. Oh, God—why was he alone?

So the first paroxysm passed, and life came shuddering back to him. Paul Albany was fighting against, and therefore conscious of, the cold and the loneliness. The music of the wind died; it assumed the caterwauling of lynxes, the howling of wolves, and all the horribleness of man's world, not of God's world. Paul shrank into himself, stretched out his hands, clawed at the snow. 'Oh, God!' he cried. 'Why am I alone?'

And then—then he saw something moving towards him—a dark shape in the darkness—coming towards him, slowly, painfully dragging on, foot by foot. His hands touched fur—he clutched it. He drew it to him. A frosted muzzle caressed his face. It was Skilko!

Skilko, dragging the hateful trap! Skilko, now that all else had failed, now in the hour of his direst need, dragging himself to the feet of man, the only God he knew—to the feet of the very man who had set the trap—dragging himself, disarmed and helpless, to plead death or mercy!

And Paul, understanding, knew that all bitterness was at an end. He groped for his trap-key, found it, and with dead fingers loosed those deadly jaws. And with their relaxation it seemed that the last cruel bonds were split asunder from the soul of Paul himself. The dog was in his arms, and at his soul was a great quietude.

And so they lay together. Around them the snowflakes fell with feathery gentleness. The very wind seemed to sing a softer lullaby, and at the soul of Skilko, too, there was a great peace. He had tasted the boundless freedom of the wild; he knew also its bile and its bitterness. And now, in the hour of his need, he had found that which he most craved—the touch of love and the fellowship of man.

. . . . . .

Spring came. Were they ever found? What does it matter? What does it matter what man sees or sees not? For, if for a moment the curtain be raised, and a story or a poem of Wild Nature be laid naked before man's eyes, the thousand and

one who do not see for themselves pass by with a doubtful smile.

Time passes. Chickadees call in the thickets, and the glaciers thunder from the heights. Nature weaves her fabrics, autumn dawns, and a million million jewels drift to earth as for a million ages past. Yet each year brings its stories, each falling to earth to be buried by its fellows, even as the leaves bury their dead—stories as countless as the leaves themselves, as boundless as the stars, and many of them, alas! as distant from man's comprehension.

SPONGE-PLANTATION FISHERIES.

FOR years the wholesale destruction of sponge-beds, where the sponge, that interesting sea-animal, comes to maturity by feeding on microscopic sea-life, has been a source of concern, for the fishers tear up great and small, and cause much havoc. Science has come to the rescue. Sponges grow from minute round particles sprouting from the inside of the irregular canals which are contained in the parent sponge's interior and open into each other as well as into the outside holes on the surface of it. In time these particles become detached, and float away out in the currents of water circulating through these canals, till they come to rest on some hard substance, when they attach themselves to it by a flat disc. After many experiments, it has been arrived at that sponges can be propagated also from slips or cuttings, like plants. To-day, then, sponge-plantations are being laid down on a great scale in the warm waters of the Bahamas and the Gulf of Mexico.

Sixty years ago or so practically all sponges came from the Levant and the Mediterranean, but now large quantities are got in Honduras, Mexico, the Bahamas, and the waters of the coast of Florida. So great is the output from U.S.A. waters that comparatively few sponges, even of the finer varieties required in surgery and chemical experiments, are imported into the States. Sponges are found, however, in nearly every sea where the water is warm, and currents and waves are not pronounced. Of the three hundred varieties known, many of which are named from their shapes—the fan, the distaff, the trumpet, the feather, and others—only a few are fit for use. Numbers of them have hard substances like flint, and as sharp as needles; others are covered with prickly points, and are of no value commercially.

The sponges that are of worth are irregular round masses, yellow, or light brown, sometimes almost red. They grow in groups in from twelve to a hundred feet of water among the rocks and ledges to which they are attached. Here they live and die, fixed to the one spot, for, though, after much dispute among zoophytologists, sponges are now classified as animals, they have no means of moving.

Along the coast of Florida, where now lie the world's greatest sponge-fisheries, the industry had its beginning several years before the Civil War. From a small commencement, in which fishing was confined to the shallow waters around Key West, it gradually reached out northward along the west coast and out of the gulf. Northward the fishers spread up to Anclote River, fifty miles above Tampa Bay, where were discovered the most prolific beds in the United States waters. There is none to be compared with them in southern European waters, much less in the Red Sea, once so noted for its sponge-fisheries. Only in the Bahamas is there a site as prolific.

The Bahamas have an old repute for sponges. The underwater banks there are generally composed of coral, with corally ledges, in the clefts of which the sponges propagate abundantly. Andros Island, the Bemini Group, Bahama Island, Green Turtle Cay, and others have afforded fishing-grounds for many generations. But it is the Caicos Group, off the south-east corner of the Bahamas, which alone rivals the United States supplies. Here is produced a large proportion of the sponges used. The fisheries are located on a submerged coral-bank, which is fifty miles long, ten miles wide, and from twelve to thirty feet under the surface.

The sponge-fisheries form one of the principal industries of the Lucayos. The craft of the Bahama fishermen stud the waters off Andros, the Caicos, and others of these charming islands, and very stinking craft they are. The slimy sea-animals are first left exposed to the sun for two or three days till they are dead, and certain parts rot off; then they are put into water, and steeped for several more days, and washed clean. After this they are dried in the sun, and trimmed, when they are ready for sale.

In outlying parts of the Bahama waters, as well as those in the Gulf of Mexico and elsewhere, sponge-fishers use the clumsy hook-and-pole method of harvesting this valuable marine product; or, again, resort to diving and slicing, or tearing, the sponge away. Where the bed of the sea is rocky the latter method is ineffective, and the fishers are seldom able to work to a greater depth than thirty-five feet. In 1908 a complete revolution took place, first in the Florida sponge-fisheries, and later in those elsewhere. American capitalists introduced divers from the Levant, equipped with diver's gear. Against their skill and equipment the hook-and-pole spongers had little chance.

The centre of this invasion was at Tarpon Springs, Florida. Tarpon Springs became Hellenised, and so did American sponge-fishing. The total value of the sponges handled at this market alone now annually exceeds a million and a half of dollars. The Greek sponge-diver plies his trade clad in a waterproof canvas suit and an air-helmet. Not nowadays has the sponger to peer through a glass-bottomed bucket into the depths below, and reave away the sea-animal from its rocky base by means of hook-and-pole. He sinks to it, cuts the sponge away from the bed of the sea or the cleft of coral or rock, and walks along the bottom, slicing off the sponges as he goes.

He and his mates live on board a three-masted schooner all the period of its cruise, which is usually from sixty to seventy days; and the vessel carries small boats rigged out with air-pumps and all the diver's paraphernalia. When the diver is at work his craft follows him on the surface, pumping fresh air to him, hauling up the bags filled with sponges, and lowering empty ones. Frequently the sponging-diver remains down as long as three hours. The diving-dress is so well made that there are few risks except from unforeseen accidents and sharks. He carries no weapon save his cutting-knife, which he does not use against Jack Shark save when unexpectedly attacked. On seeing a shark, he remains motionless until it moves away, as a shark will not attack anything it takes for dead.

With the help of the diver, sponge-plantations have come into full swing. And so man gathers crops under the sea as well as under the sun.

NORTH OF THE ZAMBESI.

PERHAPS one of the least-known parts of coastal Africa is that immediately to the north of the river Zambesi, comprising the district of Quilimane, in the province of Portuguese East Africa.

The war, as with so many other parts of the world, added to that knowledge somewhat, for Von Lettow passed some months in this region, reaching his most southerly point when he took Nhammacurra, only twenty-five miles by rail from the port and capital of the district—Quilimane.

With the fall of Nhammacurra, from north, east, and west, British troops came down, in yet another attempt to encircle this elusive Hun. The town of Quilimane was filled for a while with men in khaki and men in blue, who were rushed up to assist 'our most ancient allies' in the defence of the seat of government; but Von Lettow, resisting the attractions of the capital, and refusing to be lured into a network of swamps and rivers, swung north-west, and once again eluding the converging forces, resumed his De-Wet-like performances, which terminated only with the Armistice.

So for some few months an air of bustle and energy marked the decayed old town. But with Von Lettow rapidly disappearing over the north-western horizon, the necessity for our troops' presence was gone; they were evacuated, and Quilimane returned to a somnolence that could hardly have been more profound when, some four hundred years previously, Vasco da Gama sailed up the river Bons Sinaes ('Good Signs') to take possession of the land in the name of His Most Catholic Majesty Manuel I. of Portugal. Contrary to the historical experiences of practically all other colonies, this territory has remained in the possession of the original European discoverers and owners.

Various theories are advanced as to the discoverer's reasons for so entitling the river; such as, that the natives were of a friendly disposition, or that good water and anchorage were obtained—for in those days, it is generally conceded, this was one of the chief exits of the Zambesi, though now it does not connect. Perhaps the most picturesque explanation for the title is that here were encountered the first dhows from India, supplying the much-desired proof that the voyagers were indeed on that road by sea to the fabled wealth of the Indies that had for so long been dreamed of and sought. Whatever the reason, one feels that cheery optimism must have been the chief factor, as the good signs must have been rather scarce, amid surroundings of endless mangroves rooted in black slime, with a background of swamps, the only obvious products of which were innumerable mosquitoes and a wonderful variety of other winged pests.

But perhaps the great Vasco was blessed with the foresight that might detect the wonderful possibilities of his Terra Nova. If 'twere so, that foresight has not been inherited by the descendants of that exceptional man, for there can be few districts of any colony that after four hundred years of possession are without a single mile of Government-made road; while the railway mileage consists of twenty-five miles of broad-gauge, cut in two by the unbridged river Mucello, and a narrow-gauge line of the same length, terminating in an uncompleted bridge. And this in a country where the engineering difficulties are of the slightest, a country which, a glance at the map will show, is the natural outlet for British Nyasaland.

In 1913 the route was surveyed, and taxes were introduced that should pay for the construction of this railway which would at long

last develop the country and make of Quilimane a flourishing seaport. Every native in the entire district is taxed, in amounts that vary in accordance with his proximity to the projected route; and an impost, solely for the railway, of at least 2 per cent. *ad valorem* is charged on all exports and imports. No official book-keeper has been appointed for the railway, though some £200,000 has been collected. The port that is to handle the large increase of traffic is still furnished with one small hand-crane that once used to lift five tons, while all loading is done by lighters.

After six years, twenty-five miles of that railway, minus a bridge, had been completed! Shade of Vasco da Gama! Those twenty-five miles of railroad may be credited to the Government, while a steadily increasing scale of taxation and endless regulations must be placed to the other side of the account.

A recent law is to the effect that the managers of all firms holding land must be Portuguese. Here, in the district of Quilimane, exists the unique and much-criticised system of the *prazo*. Maugham, in his *Zambezia*, describes it thus:

'It consists mainly in the letting or leasing by the State to approved persons or associations of the sole right of collection of native taxes and imposts in a given area called a *prazo*. On an application for a *prazo* being made, an immediate census of its native population is proceeded with, and on its conclusion, the area as it stands is offered at auction to the highest bidder; the upset amount of rent payable being 50 per cent. of the native tax-revenue capable of collection as calculated on the basis of the census taken.'

Certainly a unique method of shouldering the burden of Empire! After the auction, the lessee is responsible for the administration of the *prazo*, which is carried on by means of *sepais*, or native police, though nowadays there is a Government *Agente d'Autoridade*, who is paid by the lessees and a Government-paid inspector called the Fiscal.

With the exception of two small *prazos* and some few small freehold properties, practically three-fourths of the district is divided into *prazos* held by the following companies: Boror, Madal, Lugella, and Zambezia. And it is no exaggeration to say that the vast majority of the driving-power and development has been supplied by foreigners—Swiss and Frenchmen. Hampered by endless regulations, and for many years by a lack of capital, these men have laboured on, and at last are beginning to see the fruits of those endeavours, which fruits are in danger of being plucked from them by means of impossible regulations and prohibitive taxation.

For many obvious reasons, the development commenced at, or near, the coast, and there the ground is suited only to the growing of coco-nut palms. The type of copra produced ranks very high, and the Companhia do Boror, with a million of palms, is to-day considered to be the largest palm-owning concern in the world, while the Société du Madal has some half a million palms planted.

Both the Boror and the Zambezia *prazos* also include inland parts of the district, and here are grown sisal, cotton, rubber, and sugar. Some sixty miles from the coast the lands of the Lugella *prazo* commence in a magnificent territory, where, from some undiscovered cause, the mosquito ceases from troubling—and life is simplified thereby.

Roads have been cut through the virgin forest in every direction, and where a dozen years ago the white man dared not pass, thousands and thousands of sisal, tobacco, and cotton plants are yearly being planted.

And here, as in all the inland parts of the districts, is to be obtained hunting that is in every way superior to that of the much-advertised British East Africa, comprising every description of game in great abundance, from the royal lion, elephant, and rhino to the lesser antelopes. Maugham's *Wild Animals of the Zambezia* gives a vivid and charmingly written account of the author's experiences with the rifle in this little-known paradise of hunters. As an example of what is possible, the present director of the Companhia do Lugella, M. René Vuilleumeir, shot thirteen lions in two consecutive weeks, three of them in one afternoon.

From Nhammacurra to Lugella a light railway, to connect with the Quilimane-Nhammacurra broad-gauge line, is in course of construction, whereby access would be easy to unrivalled hunting-grounds, amid scenery of a tropical Switzerland, where one forgets the malarial swamps and humidity of the coast, and where the right sort of hunter would be welcomed by the hospitable directors of the various companies. A great land of infinite possibilities, with its magnificent timbers, and a soil that can produce anything; a land that cries aloud for roads and railways, and that would give such wonderful returns could it but receive a minute portion of the attention which it deserves but which it has so completely lacked for the last four hundred years.

PHŒBE.

A PERIWINKLE butterfly went twirling thro' the air;
It was giddy with the sunlight, so it caught in Phœbe's hair.
And Phœbe sat lamenting 'cause the butterfly got free—
I think she's sitting crying still, beneath the willow-tree.

BETTY DUNDAS.

'HOW TO KNOW THE STARS.'—We greatly regret that in this article in our December issue, the sun's diameter was given as 8800 miles instead of 880,000 miles. The second star whose diameter was measured at Mount Wilson is Arcturus, not Aldebaran, as there stated.

THE MONTH: SCIENCE AND ARTS.

HUMAN ADAPTATION TO HIGHER ALTITUDES.

In view of the departure for the Peruvian Andes of an expedition, promoted by several learned societies, and having for its object investigation into the effects of high altitudes on the human respiratory and circulatory systems, an article on the subject in a recent number of the *Indian Journal of Medical Research* is most opportune. The author is Captain Kingston, of the Indian Medical Service, who accompanied a survey-party to the Pamir Plateau, 'the roof of the world,' making on the way thither, and after arrival, a careful series of observations. He comes to the conclusion that 'mountain-sickness' shows that a process of acclimatisation is going on as an ascent is being made. The prime factor in this acclimatisation is an increase (proportionate to the height attained) of the number of red corpuscles in the blood, the increased number of these oxygen-carriers counterbalancing the decreased efficiency, due to the rarefied state of the atmosphere, of each individual corpuscle. Where the ascent is sufficiently gradual, this increase takes place at such a rate that the supply is equal to the demand, and no trouble is experienced; but should the ascent be unduly rapid, there occurs a marked deficiency in the number of red corpuscles, and symptoms of mountain-sickness supervene. In ordinary cases the deficiency is made good fairly quickly, if the climber remains for a time at the same altitude, and he is then ready for another portion of the ascent; in some cases, however, the time needed for acclimatisation is a somewhat lengthy one. Actual observation has shown that those living in high altitudes have a larger number of red blood corpuscles than those dwelling at low elevations, and that the number is increased and decreased by ascent and descent respectively. In other words, Nature is here showing her wonderful power of adjustment to man's needs, and is providing mechanism whereby the same amount of oxygen may be carried by the blood whatever the rarity of the atmosphere may be. Experience has shown that, by taking proper precautions, man can readily adapt himself to an atmosphere having a density only half that of the normal; and Dr Kingston thinks that even the air on the top of Mount Everest, which has a density only one-third that of the air at sea-level, would be quite sufficient to support life. We observe that the author does not say whether the increase in the number of red corpuscles is accompanied by a correspondingly increased aggregate amount of hæmoglobin. We presume, however, that it is, for it is the generally received opinion that it is this substance which is the active agent in carrying a supply of oxygen to the tissues.

AN IMPROVED TEA-POT.

An improved form of tea-pot, the invention of a medical man, of which we have recently made adequate trial, effects a distinct saving of both time and tea. The improvement consists in a patent 'stirrer,' which passes through the centre of the lid (to which it is firmly attached) nearly to the bottom of the tea-pot. By simply turning the knob fixed at the upper end of the stirrer a few times, a uniform infusion is made in about half the time usually taken, thus ensuring the absence of tannin and all bitterness of taste. The saving in the amount of tea consumed works out at about 20 per cent. The lower part of the stirrer is made in two forms, one being solid, and the other hollow. Our personal preference is for the former, though there appears to be little or no difference in the degree of efficiency. The tea-pot itself is of earthenware enamelled in artistic shades.

A CHEAP VACUUM CLOTHES-WASHER.

Many are the mechanical aids offered to the housewife of the present day, but, alas! all too often at a price beyond her purse. We have recently made a thorough trial, however, of a hand vacuum washer which is sold at a very modest figure. The essential features of the appliance are: (1) a cone-shaped copper body, into the top of which a wooden handle, of the length deemed desirable by the user, may readily be fixed; and (2) a copper disc, perforated with a number of holes, fitted inside the cone-shaped body some distance from the bottom. The clothes having been placed in a tub with the necessary amount of boiling water and of flaked soap or soap-powder, the washer is simply worked up and down among the clothes by means of the handle, which is kept as nearly upright as possible. Owing to the suction action of the perforated disc, the soapy water is drawn evenly through the material, and the clothes are clean in a few minutes. The device is also of great service in the operations of rinsing and blueing, as it ensures the complete extraction of all soapy water and the perfect distribution of the 'blue.' Being made of rounded copper throughout, the appliance will not tear the clothes, and it can readily be taken to pieces for cleaning purposes.

A MOTOR-LORRY WITH A 'HIGH-LIFT' BODY.

The tipping body for carts and vans has been a familiar object for a great many years, being used for carting coal, stones, or other material in bulk. This principle has been extended recently in the form of a body which can be raised as well as tipped. Moreover, the power for performing these operations is derived from the

motor itself. It is impossible without the aid of illustrations to explain exactly how the lifting and tipping operations are carried out. To put the matter briefly, a shaft about three inches in diameter across the chassis acts as a drum for winding up two very stout chains, which are attached to the ends of two huge curved lifting brackets. These brackets are fitted at the extreme rear of the chassis, and normally lie flat just under the body. When lifting begins, the body pivots at the rear end, and the action of the lifting brackets pulls up two push-rods under the front end until the front of the body is raised to its full height. At this point the rods, having reached the limit of their upward movement, come up against stops, and the fulcrum changes to the front end, the rear end of the body being then raised to a height of between seven and eight feet. The shaft which performs the operation is worked by a special power head in the gear-box, which transmits the motion through reduction gears. These bodies save a considerable amount of time and labour for certain purposes. For instance, a two-ton body may be raised so that it will tip its contents into a railway truck. Again, it may be run alongside a first-floor doorway, where it can be loaded or emptied much more conveniently than if at the customary height. The body is quickly lowered by releasing a hand-brake on the reduction gear.

A LINE-THROWING ROCKET-PISTOL.

In our issue for August 1921 a description was given of a line-throwing gun which was being tested by the Royal National Lifeboat Institution. A comparatively small pistol for a similar purpose, but working on a different principle, has been brought out recently. Instead of giving a high velocity to a projectile, which enables it to carry a light line over a long distance, the pistol gives a smart send-off to a rocket which afterwards propels itself. Each rocket consists of a steel tube, charged with rocket composition, and fitted with a metal choke and head-piece. A metal rod forms the stick, to which is spliced a short length of flexible wire cord, the rocket line being attached to the eye of the cord. The pistol is fitted with a hand-rest and a canvas guard, the former being fixed at an angle of 35 degrees, which permits the user to get the necessary angle for firing in a natural way. A pull of the trigger fires a small cartridge, which not only ejects the rocket, but at the same time pierces the waterproof covering at the choke and lights it, the rocket then proceeding straight on its course, and remaining visible by either day or night. The rocket lines are 'flaked' by a special method, and are stowed in water-tight cases, which are opened by tearing away four tapes; the top of each case can then be removed, when the two ends of the line are at once seen. A bowline is formed at the bottom end, so that another line can be quickly attached before the rocket line is fired. At a demonstration at Parkestone Quay a half-inch line was thrown 230 yards, with a strong wind blowing across the flight of the rocket. One-pound and two-pound rockets are used with the same pistol, and they carry half-inch, three-quarter-inch, or one-inch lines. At a recent trial from the training-ship *Warspite*, a three-quarter-inch line was thrown for a distance of 180 yards by means of a two-pound rocket, while with a one-pound rocket four half-inch lines were thrown over a small dinghy moored 100 yards distant from the ship. More recently still, at a demonstration where only one-pound rockets were used, a half-inch line was thrown 125 yards, a three-quarter-inch line 110 yards, and an inch line 80 yards. In the past a considerable portion of the power of rockets for line-throwing has been wasted in lifting them from their troughs. The pistol avoids this waste by giving the rocket a quick send-off; it also facilitates taking an accurate aim. It is an interesting fact that Sir Ernest Shackleton's ship the *Quest* is provided with one of these rocket-pistols.

A UNIVERSAL WRENCH.

Almost every one, at some time or other, has occasion to use a wrench for tightening or loosening a nut; by the car-owner this useful appliance is constantly in demand. Nuts, of course, vary in size, and to deal with them one must possess either a considerable number of wrenches or one which can be adjusted. The adjustable wrench, however, does not usually take so firm a grip of the nut as the ordinary variety, and where great force is required it is unsatisfactory. What may be termed a universal wrench has been invented recently, which will fit practically any hexagonal nut; and the harder it is pulled, the more tightly it grips. The device consists of a steel bar, with a working part adapted to deal with large nuts at one end, and one suitable for smaller nuts at the other. Each of these working parts roughly resembles a horse-shoe in shape, the ends of the shoe being united by a flat bar, to which the sides of the 'horse-shoe' are inclined at an angle of 120 degrees. Hence the wrench may at once be placed over a nut in such a way that the two inclined sides of the horse-shoe are in immediate contact with two edges of the nut. The rounded portion of each working part is pierced laterally to admit the passage of the steel bar, to which it is attached, the end of the bar pressing hard on that edge of the nut which is opposite to the flat bar previously referred to. Each working part is pivoted on the steel bar in such a way that the bar acts as a lever when it is turned, thus turning the nut; and the pivot is so located that the harder the bar is pulled the more closely is the nut gripped by the surfaces with which it is in contact, thus obviating any chance of

slipping. Between them, the two ends of the wrench are capable of dealing with fourteen different sizes of nuts. Most important of all, this appliance does not damage the corners of the nut even in the very slightest degree.

A NOVEL OIL-FILLER.

Although primarily intended for filling motor crank-cases with oil, the filler we are about to describe should be equally useful for the lubrication of all kinds of machinery. It consists of a copper jug, holding two quarts, the main feature of which is a flexible spout, leading from an opening in the centre of a false bottom in the lower part of the jug, and thence through the side of the jug, near the true bottom. This spout, which is really a flexible metal pipe with a nozzle at the end of it, can be turned about in any direction, and provision is made for holding it in position when it is not in use. The central aperture in the false bottom is provided with a valve fixed to one end of a little rocking lever, the other end of which is connected to a rod passing up the side of the jug to the top, where a button on the end of the rod is conveniently placed for the operator's thumb. Normally the valve is kept closed by a spring, and nothing can flow into the spout; but when this button is pressed down the valve is raised, and oil can flow through the aperture in the false bottom into the spout. A strainer is fitted half-way down the jug, which removes all impurities in the oil. With this appliance, therefore, not only is the funnel eliminated, but the oil is strained and measured in one operation.

A HUGE MINE HOIST.

Very powerful machinery is needed to wind up coal and ore from deep mines, several tons being carried in the 'cage' on each journey, and the maximum speed approaching forty miles an hour. Two cages are employed, one coming up while the other is going down. They are hung on huge wire ropes, which are wound upon, or unwound from, enormous drums at the pit-head. It might be thought that the weight of one cage would balance that of the other, and therefore only the weight of the load of ore or coal would have to be reckoned with. But where depths of some thousands of feet are concerned, the weight of the rope may amount to several tons, and has to be allowed for. This is done by winding it on a spiral groove, so that, to begin with, the effective diameter of the drum is comparatively small, and the engine is able to exert its maximum power when it begins to raise both rope and load from the bottom. The diameter of the drum becomes larger and larger as the cage ascends, and after the two cages meet and pass each other the extra weight of the descending rope over that of the ascending rope assists the engine in its work. As the drum runs at the same number of revolutions a minute throughout the journey, the speed of the cage increases from the bottom to the top, owing to the increasing diameter of the groove on the winding-drum. The rope from one cage is wound in one direction on one end of the drum, the rope from the second cage being wound the opposite way on the other end of the drum. Usually a powerful steam-engine is coupled to each end of the drum-shaft, while brakes and safety devices are provided to stop the cages at the top and the bottom respectively. The foregoing explanation will enable our readers to appreciate the following particulars of a mine hoist which *The Times Engineering Supplement* states is believed to be the largest steam-driven mine hoist in the world. The drum for this hoist has a spiral groove for the rope with a maximum diameter of 30 feet, but starting with a diameter of only 16 feet. Built up in forty-eight sections, bolted together, it weighs 230 tons. The shaft upon which it is carried has two bearings, each measuring 28 inches in diameter and 54 inches in length. A part of the drum at each end, 16 feet in diameter, is fitted with a brake, which is put on or off by the action of a big piston in a cylinder. All the engine-man has to do is to open a valve at one side of the piston, thus admitting oil under a high pressure, the effect being to put on the brake with enormous force. Safety devices automatically shut off steam and apply the brakes if the engine-man fails to do his duty. The rope used weighs $18\frac{1}{2}$ tons and is 10,000 feet in length; the cage weighs $4\frac{1}{2}$ tons, and carries 10 tons of copper ore at each wind. The maximum speed is 3200 feet per minute. A compound condensing-engine is coupled to each end of the drum-shaft, and the total weight of the machinery is nearly 800 tons. This mine hoist is installed at a copper-mine in Michigan, U.S.A.

A PETROL FLAT-IRON.

A good deal of ingenuity has been expended upon attempts to improve on the ordinary domestic flat-iron, mainly in the direction of providing a source of heat in the iron itself, so that the temperature shall remain constant. The gas-iron was invented many years ago, and is still in use; electricity is also employed as a heating agent. Such irons, however, involve flexible tubing or wires respectively; while in the country a large number of households are still without gas or electricity. An iron heated by petrol has been brought out recently, which is maintained at a constant temperature for a very low cost. The iron is of the usual form, but is much deeper, and is made hollow. At one end of the iron proper is a spherical container for the petrol, which is kept under a certain low degree of air-pressure, the container having air pumped into it every time it is filled. A pipe from the bottom of the container passes along the top of the hollow in the iron to

the pointed end, where it turns down and is brought back along the bottom. The petrol is vaporised in the upper pipe by the heat from a row of petrol gas-jets issuing from holes in the lower pipe, the device being similar in principle to the well-known Primus wickless stove. Owing to the gas being under pressure, extra air mingles with it at the jets, which burn with a blue flame, denoting a high efficiency. As with a Primus stove, the vaporising-pipe has to be heated by methylated spirit for a minute or so before the petrol is turned on. The size of the jets, and consequently the heat of the iron, can be regulated to a nicety, and the iron is perfectly clean and safe to handle. Once the burner is started, it will keep going for four hours on one filling of the container, at a cost of about threepence halfpenny.

SOMETHING FRESH IN SPEEDOMETERS.

A speedometer, to indicate how many miles an hour a motor-car is travelling, forms an almost indispensable item of the dash-board equipment, and many instruments have been invented for this purpose. In one of the most recent a current of air is projected upwards in a cylindrical case by a rotary fan at the bottom, this being driven through gearing (in the case) by a flexible shaft connected to one of the wheels. A broad ring, shaped like part of an inverted cone, above the fan-blades, and rotating with them, deflects the air to the sides of the case. On reaching the top of the case, which is formed by the dial of the instrument, the air is projected towards the centre, whence it takes a downward course, and a continuous circulation is set up. During its passage downwards the air passes through a number of vanes radiating from a central spindle, these being mounted above the rotating fan, but having no connection with it. The spindle projects upwards through the centre of the dial, and carries a needle which indicates the miles per hour on a circular graduated scale marked from 10 to 60. A tiny chain wound on the spindle and attached to a spring tends to keep the needle at the lowest end of the scale. The air passing the vanes turns them in the opposite direction, winding up the chain and extending the spring, the extent of the movement being dependent upon the strength of the air-current, which in turn is governed by the speed of the fan, and therefore by that of the wheel which rotates it. The instrument is supplied as described, or combined with a mileage recorder.

THE SMALLEST LATCH-KEY IN THE WORLD.

A front-door latch, which is operated by what is believed to be the smallest key in existence, has been placed on the market recently by a noted firm of safe and lock specialists. This key, which is made of duralumin, measures only an inch in length, while the width of the blade is $\frac{3}{8}$-inch, and the thickness about that of a penny-piece. The essential part of the latch is a tiny rectangular box, containing a number of thin metal strips. These slide endways in the box, and each is pressed towards the keyhole end by a separate spring. The extremity of the key crosses the ends of the strips, and projections upon it push certain strips backwards to a greater or less extent. This arrangement allows of varying the height of the projections, and so of producing a large number of different keys. On the edge of each strip is cut a V-shaped notch in a different position, and it is only when the right key is pressed into the latch that these notches are brought into line. Placed thus, they form a groove across all the strips. A wedge-shaped excrescence, exactly fitting this groove, projects through the side of the box. It forms part of a tiny lever pivoted at the opposite end, and constantly pressed towards the groove by a spring. So long as the key is in position and the excrescence in the groove, the box can be turned and the latch pushed back; but when the key is taken out, the strips are pushed forward by their springs and force out the wedge-shaped excrescence. At the back of the excrescence is a small projection which drops into a slot in a fixed cylindrical case, so that the box and latch are locked. The key passes through a slot which exactly fits the blade, and the latter is recessed as regards the middle part, so that the middle portion of the slot is very narrow. At each side of the key is a small projection which will enter the mouth of the slot, but comes up against a narrower part when the key is pressed home. When the key is turned these projections pass under an outer flange, so that the key can be withdrawn only when the latch is locked. From the foregoing description it will be gathered that to pick this lock would be a practical impossibility, while the key is so small that it might well be hung on the watch-chain.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (*a*) a reply post-card, or (*b*) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

By JOHN HASLETTE VAHEY, Author of *Johnnie Maddison*, &c.

PART I.

I.

FOR six years nothing had happened in Kule. The spider jetty, deserted and fast getting out of repair, still straddled the slow-moving brown stream between the barriers of mangroves and mud; the range of godowns still stood rotting on the cleared bank; but, save for Godfrey, the trader, who had once run the store with the aid of the New Guinea woman he called his wife, life seemed to have passed by the settlement. It had once been a rising hope, a prospective entrepôt for the interior, an intended port of loading for the wealth of minerals which were expected to pour in from the developed hinterland; it was now a dismal spectacle of neglect, silent, passive, depressing—a tragic monument of fallen hopes.

Gold was going to be found up the river—once! There was going to be a rush—once! But Kule was now definitely in the past tense, a deserted village surrounded by a few overgrown patches where taro, yams, and other easy-going vegetables had once been cultivated. Even the gay, impudent birds, when they crossed the river from bank to bank, seemed to scream insolently, to chuckle over the ineffective efforts of the two-legged humans to make a lodge in this wilderness; and the cunning alligators, lying up on the slime among the mangroves, smiled their mocking, reptilian smiles, as if sardonically amused at the ever-present spectacle of ruin and decay.

'Mrs' Godfrey, insufficiently but comfortably clothed in a *rami*, sat under the shade of her veranda, and, fumbling with her brown fingers in a little bag, prepared a chew of betel, fishing up in turn the nut, a pinch of lime, a green leaf. She stared reminiscently down the stretch of brown river to where it disappeared behind a dog-leg bend.

To her simple mind this solitude (where one could dress airily, and chew betel without interruption) was finer and more beautiful than anything a prosperous Kule could have shown. No more work to be done in the store; no 'white' clothes to wear; nothing but a continuous *dolce far niente*, broken only by the occasional preparation of a meal for a husband who had forgotten all his ancient niceties, the ceremonial proprieties of the white man, in this lotus land. So she sat and chewed, ejecting the crimson stream of betel-juice extracted by her slowly masticating jaws, and thanking whatever gods she knew for peace and sunshine.

The jetty was falling to pieces. It would soon be gone. The godowns were roofless. They, too, would soon be gone. It was better so, she thought complacently. Nature was like that. Prosperity always means work, and who would work in a land that gives sun and shade, fish, fruit, and vegetables in gratis abundance? Her greatest fear nowadays was the arrival of a ship. Ships meant white men, with their mad desire to make things, improve things, do things. And then farewell to *rami* petticoats, inglorious ease, the chewing of betel under the shade of one's own vine and fig-tree!

But life has always a cane up her sleeve for the chastisement of her complacent children! Even as 'Mrs' Godfrey chewed, and congratulated herself that the clock had stood still for six years, the nose of a fore-and-aft schooner poked inquisitively round the bend, swung round, as if it had seen the forlorn jetty waving a welcome, and the white lines of the schooner itself appeared against the umber of the placid river.

'Mrs' Godfrey's jaws paused in the very act of mastication, and a crimson trickle of betel-juice appeared on her lips. A ship!

Her brown face expressed alarm, unmingled with resignation. This was what she had ever feared, the thing which might actively recreate in her 'husband's' mind memories and ambitions she had hoped for ever forgotten. He was away now, somewhere in the bush inland, hunting. Could she get the schooner to go away again, before he saw men of his own kin, and began once more to dream white dreams?

Her lares and penates were the bush, the mouldering houses, the decaying solitude of the dead village, and the schooner was an enemy to these; the white men aboard were her enemies, representing civilisation, progress, action, all those deadly opponents of sloth and the betel habit, the luxuries of her simple life. She was like one of the many creeper parasites which en-

 [*All Rights Reserved.*]

cumber the forest trees, clinging, overwhelming in her embrace, finally killing all the finer attributes of the tree, breaking it down, disintegrating its fibre.

All her defensive instincts were at work, planning, scheming, as the schooner, under the impulse of a light breeze from seaward, came up the river. What did it want here? She asked herself the question without anger, but without comfort. Were they coming to take her man away, these whites? As the schooner's mainsails came down with a run, and she saw the crew preparing to drop anchor, a hundred yards to the south of the jetty, she rose slowly, closed her little bag, ejected a final crimson stream of juice from her lips, and began to walk leisurely towards the shore end of the decayed pile structure straddling in the river.

There was not a detail that escaped her slow, soft eyes. She saw a man in white, wearing a pith helmet—obviously the captain. He sauntered aft as the anchor-cable ran hissing through the hawse-pipe, came back again to watch some men preparing to launch a boat. She saw, towing by a painter behind the schooner, a dilapidated whale-boat, white with salt encrustations. She stood still on the first boarding of the jetty, her *rami* fluttering in the wind, like a figure in warm brown stone. Her face was impassive, except for a slight working of the nostrils which besnoke fear and uneasiness.

The white-clad man on the schooner's deck focused her through a telescope, and shouted to some one. Then the boat went down with a light splash into the water, a ladder was lowered over the side, and he descended, following two of his men into the boat. Across the crawling brown water she could hear him speak shortly.

'Give way!'

II.

To European eyes Captain Andrews would have appeared handsome; to 'Mrs' Godfrey he seemed determined merely—determined to attack her solitude, to rape from her her 'husband,' carrying him off across the big water to some remote and unreal clime. As the boat bumped against the piles of the jetty she looked down into it, her lips tight, her eyes sombre, like those of a man who consciously leads a forlorn hope, but will give no single step while life is in him.

Captain Andrews, turning up a sunburnt face, ventured a question: 'What name this fella Mary?'

Scorn mingled with trepidation in her answering gaze. She drew herself up. 'Hell!' said she, wonderfully mimicking her absent husband. 'What you take me for, eh? My word! You keep your pidgin talk for niggers, captain.'

Captain Andrews took off his hat, half-ironically, half-apologetically. 'I beg your pardon,' he said, in a melodious but slightly drawling voice; 'my apologies, madam. I came up here hoping to get some one to interpret for me—thought there might be a settlement up here.'

Her face was a little relieved. 'You want water—stores? You can have water.'

'An interpreter—some one to——' He paused. 'We've got a nig aboard, and even my Kanakas can't understand him. I thought some one here might understand the lingo.'

She pursed her lips. 'No one here, captain; on'y me. I'm widow, you savvy—all alone. Perhaps you take me out your boat, and I say what this nigger fella say to you.'

'Good biz!' said Andrews, smiling. 'I don't want to waste any more time over this fellow. Can you get in, or shall I beach the boat?'

'Mrs' Godfrey did not reply. But she was herself again; her nimble wits were at work. There was a chance of getting the schooner away before her husband returned, and she took it, slipping down one of the piles into the boat like an acrobat, with an unashamed display of bare brown limbs. 'Let her rip, cap!' she said easily.

The men at the oars grinned; Andrews smothered a laugh, and spoke again. 'We picked up this nig at sea, in the whale-boat you see trailing behind my boat. He had a shot-wound in the shoulder, and seemed pretty bad—excited, too, about something, or I shouldn't have worried with him.'

'Mrs' Godfrey nodded. 'I make him talk, you bet.'

The rescued black was on deck when she climbed over the bulwarks, a tall, burly fellow, with a mop of frizzy hair, and a stone nose-ornament. He wore a dog-tooth necklet, an armlet, and a perineal band—that was all. 'Mrs' Godfrey went up to him at once, and hurled at him a harangue in a guttural tongue.

His eyes opened wide at once; he fired a volume of words back at her, touched his wounded shoulder, showed a row of sharpened teeth in a venomous grin, and waited.

'Got it?' asked Andrews shortly.

'Sure thing!' said 'Mrs' Godfrey. 'I tell you presently.'

So they went at it again, the brown woman questioning, the man answering in great gusts of words, excited and intense.

'Looks as if he was describing a tribal fight,' said Andrews to his mate.

'He 's sure got somebody on the run,' said the latter. 'Watch him stabbing, jumping, dodging. Some fight!'

'Mrs' Godfrey turned suddenly to Andrews. 'I have him all now. This nigger, coast-nigger, alonga Palm Bay—he an' others go war-hunt after the trader on Jelks Sound. Trader fishing in whale-boat, they spear him good. He shoot two. They drop him in water; sharks eat him good. One, two hundred they go fight white fella Mary in her house. Soft chop this, they say; take store, take trade, no pay, all good. White

fella Mary, daughter of trader, she live in shore house. Those nigs belonga trader go bung plenty quick, or run. My word! Only Fi-fi that white fella Mary alive with all those fella throw their spear.'

'Fi-fi 's magic, cap,' said the mate.

Andrews's face had grown dark, but he repressed his anger. 'So the trader had a daughter? And she 's alive?'

'My word, yes! Fi-fi belonga that white fella Mary,' said the brown woman, forgetting half her acquired English. 'Shut herself up in house; no have gun but Fi-fi that shoot like thousan' gun. Put it through window. It spit—brrumph, brrumph, spit fast all the time. Fella he fall in boats, fall plenty, begin to fear debbil-debbil. Two boat they sink, two boat run ashore, and fella run off into bush. This fella him in whale-boat, think debbil-debbil. He row fast; that Fi-fi come after him—and spit, spit. He wounded, but row; spit, spit, brrumph!'

Andrews intervened. 'And got away to sea?'

'My word, yes! Out to sea. Then big buster come on; he blown further. Almost lib for die that fella. Debbil-debbil stop spitting to blow him out.'

Andrews bit his lip. 'That means there 's a girl left alone somewhere on Jelks Sound. Look here, madam; can I get to it from here pretty quick?'

She nodded. 'You go there right away, cap. But what you do with this fella first?'

'Shoot him!' said the mate, with a glance at Andrews.

'Yes,' said the captain sternly. 'He 's earned it.'

The primitive possessions and desires of the savage awakened in 'Mrs' Godfrey's breast. She set covetous eyes on the dog-tooth necklet. 'Me get that for what I do?' she asked eagerly.

Andrews walked up to the man, took off the necklet, and handed it across. 'I 'll put you ashore now,' he said hastily. 'I must get going at once. Come along.'

'Mrs' Godfrey hugged the necklet and grinned. 'That fella go bung quick,' she said, as she stepped to the bulwarks. 'No good that fella. Say himself good-bye, eh?'

She went down into the boat; the men dug in their oars, and pulled towards the jetty. Half-way to the shore 'Mrs' Godfrey heard the sound of a single shot, and a few moments afterwards a splash. An alligator which had been basking on the mud dived out like a brown torpedo. But the woman continued to smile and to fondle her necklet as she stepped on to the jetty and walked off to her veranda.

Triumph was in her eyes, her bearing. There was to be no break now in the continuity of her slothful ease. She had secured immunity from invasion, and a necklet she would have given her eyes to possess had fallen easily into her lap. 'Plenty good I think of um white fella Mary,' she mused. 'Fetch um quick that, my word! Fool fella that captain!' And with that she sat down once more in the shade, opened her bag, took from it a green leaf, a pinch of lime, and betel, and manufactured a fresh chew.

III.

Captain Andrews slewed the head of his schooner round, and went down-stream with the current towards the open sea. The breeze had freshened, but was blowing towards the land, and there was hardly room to tack in the river. Their slow progress irked him, but, once outside the heads that screened the estuary, he had all sail set, and the schooner drew away swiftly towards the southward. There was a cargo waiting for him along the coast, but the cargo must wait. Somewhere on Jelks Sound a white girl waited, unprotected and alone, in dire danger despite the Fi-fi, which Andrews took to mean a machine-gun.

Had the natives divided their forces, and attacked from front and rear at once, nothing could have saved the girl. They had made the mistake apparently of attacking from the sea only. But there must be other natives—more plucky and more resourceful than the Palm Bay natives—who would gather like vultures about a carcass when the news spread.

'Say, cap,' said the mate, coming down to him where he was examining a chart in his cabin, 'I suppose that woman was giving us the straight goods?'

'I think so. Why not? It 's not the first time this kind of thing has happened, old man; and we have the whale-boat to confirm it.'

The mate smiled. 'We aren't either of us what you 'd call ladies' men, cap. I first ran from wimmin when I was five, and I haven't done running yet.'

Andrews placed one point of his compasses on the chart, and looked up. 'We don't know what she 's like yet. Wait and see!'

(*Continued on page 166.*)

ANSWERED.

FULL moon and morning star,
Tell me my end;
How many matins are
Mine for to spend?
How many vespers lie
Still to my lot,
Ere I pass hence and die
Wholly forgot?

Nay, son, we cannot say
What hours remain:
Those that are fled away
Come not again.
Those that are yet to come
Live as St Paul;
Fighting some, praying some,
Hallowing all.

GUY COLIN CAMPBELL.

CHINA TO-DAY.

THE REPUBLIC AND THE POWERS.

By Brigadier-General C. D. Bruce, C.B.E., F.R.G.S.

I.

IT is supremely difficult, perhaps hardly possible, in such an article as this to place before readers a convincing statement of present conditions in the Far East. More particularly does this apply to China. Nor is the difficulty due entirely to the general lack of interest in, or knowledge of, Far Eastern affairs which still characterises Western thought. Under the present chaotic conditions existing in Europe, it is natural that the affairs of Europe should overshadow all else, particularly in the minds of a war-worn people still crying out for an ever-vanishing peace. Yet, as has been truly said, 'the whole civilisation of the Orient, as well as the relations, commercial, political, and social, between the Orient and the West, is swinging in the balance.'*

During the Great War and since the Armistice the average Briton has perforce learned many new lessons, political and geographical. But, as a rule, these lessons have been limited to Europe, or to the Middle East. From the face of the Far East the veil of ignorance has hardly been lifted. Nor can this happen until not only the general public, but the leading statesmen of Europe, especially of the British Empire and America, are free to devote themselves to those problems of world-wide importance which in the Far East cry out for solution.

That public opinion in Britain and America should remain indifferent to these problems seems incredible. This could not be were only a fraction of their future significance to both countries recognised. The chief argument for suggesting the vital necessity for a more general interest in such problems is that facts must now be faced in the Far East, and not, as was the case in Britain before the World War, slurred over or wilfully concealed as problems too 'inconvenient' for public discussion. To quote Mr Henry Chung once more: 'Upon the correct analysis and proper solution of these problems hinges the future peace in the Pacific basin and the welfare of one-fourth of the world's population.'

If any European nations are to help in bringing to pass the new era so devoutly hoped for by the most progressive and patriotic minds in China, then should we Britons endeavour to see things in the Far East as they are to-day. Let us not waste time, or fog our minds, by seeking enlightenment from the old China of one hundred, fifty, or even of ten years ago, for that China no longer exists. Instead, there stands a nation, a so-called Republic, containing a people of three hundred and fifty million souls. One quarter of the whole world's population! The vast majority of these are ten times more ignorant and more inarticulate even than were the Russian moujiks, before Lenin, Trotsky, and other 'saviours' of their country began their world-shaking experiment in Bolshevism.

It is necessary to emphasise these very elementary facts. For until any would-be student of Far Eastern affairs will make the effort to grasp the full significance of such a huge area, peopled by such a stupendous mass of human beings, of one race, practically homogeneous, able, at any rate in the near future, to be swayed and moved by a single spirit of patriotism, it is useless for him to attempt to understand the present situation in China. A minute minority of men, European or American trained, who have learned to think on modern lines, leaven this mountain of ignorance. But of these, some are only half-educated in present-day political and economic thought. Nor are they able to formulate in practical shape the ideas they conceive in the abstract.

'Eight years of bitter failure under a nominal republic has gradually brought Young China to the realisation that democracy cannot be secured through political changes alone; and that no democratic government can ever be founded upon a citizenry brought up in the atmosphere of semipatriarchal family system, imbued with antiquated ideas and ideals, and working in a social arrangement where the individual, even the male individual, receives no proper recognition as such. Democracy, in short, is no more and no less that the sum-total of all the democratised and democratising forces, social, economic, moral, and intellectual. It is this realisation which constitutes one of the guiding principles of the new movements in China.

'Ever since 1898, the attention of intellectual China has been confined to things political. They worked for the overthrow of the Manchu Dynasty, and it was overthrown; they wanted a republic, and the Chinese Republic was proclaimed to the world; they wanted representative government, and they have had parliaments and provincial assemblies; they tried political parties, and parties they have had, and have even to the present day. They had staked all their hopes on the political at the expense of neglecting the non-political. They were bound to be disappointed, and great indeed was the disappointment.

'Then the events of 1919 gave a new lesson. It was the non-political forces—the students, the merchants, the demonstrations and street orations, and the boycott—that did the work

* *The Oriental Policy of the United States of America*, by Henry Chung.

and triumphed. This was a great revelation, and produced a new optimism. As despair naturally results from one's coming up against some closed and blocked way of action, so hope and courage are engendered with opening up of new and fresh channels of fruitful activities. Young China now finds enough to do. Let alone the Anfu Club; let alone the internal peace conference at Shanghai; let alone the petty political intrigues in Peking and elsewhere—we still have the masses to educate, the women to emancipate, the schools to reform, the home industries to develop, the family system to reshape, the dead and antiquated ideas to combat, the false, harmful idols to dethrone, the many, many social and economic wrongs to redress. It is in these new channels of activity that Young China, with reawakened hope and vigour, is now working slowly but steadily to rebuild a new foundation for Chinese democracy.' *

Whether 'Young China' is capable of any such widespread scheme of reform remains to be seen. Mr J. O. P. Bland, in his new and illuminating book, emphatically thinks not. In any case, until the Central Government has been thoroughly purged and reconstituted upon an honest political basis, no progress throughout the provinces can be expected.

II.

Whether the period necessary for this drastic process be long or short is, in one sense, immaterial, for in the East time is not everything. 'Hustle' does not necessarily ensure success, as a war-worn Europe has learned to its cost. There are other lessons, too, which the West may yet have to learn from the East before it can put its own house in order. We in Europe have hitherto prided ourselves upon our so-called civilisation, and from this presupposed elevation have condescended to suggest, if not to dictate, improvements to the East. No longer can this attitude be maintained. The Great War has once and for all time struck a fatal blow at any such assumption of superiority. During these last terrible years the West has, all unwittingly perhaps, exposed its very soul to the East.

The horrors of the Great War perpetrated by Western nations have penetrated far beneath the surface of Oriental ignorance. These doings are now known to millions of Asiatics who before never dreamed, outwardly at any rate, of making comparisons. Lately roused from centuries of contemplation China has marked, learned, and inwardly digested the result of two thousand years of Christianity. As also have millions of other Orientals.

And what has the result been? To vast masses of Asiatics an awakening has come.

How much better, they are now demanding, is Western civilisation than their own? Where is the boasted ethical superiority of Christianity? By whom were all the unspeakable atrocities perpetrated during the war committed? To-day in the Far East such questions are being vaguely formulated—at present only vaguely.

Who can furnish the proper answer to these questions? There is no direct answer. If it is suggested that the murder of a missionary or two by bandits in the interior of China is a heathen practice, nowadays in Peking you will be reminded, very politely, of daily brutalities unchecked in Ireland; and such comparisons do not help.

What is essential is an entirely new spirit and policy in European dealings with China. In the East, as in the West, to practise what one preaches is the only method of retaining the trust and confidence of those we would convert, whether the higher standard aimed at be ethical, economical, or political.

III.

Let us now turn to the actual situation in the Far East to-day. Before doing so, it should be understood that this article has no pretensions whatever to enlighten experts. It is the writer's desire to present in a simple form to uninformed inquirers a few main points. These can be used as sign-posts should the reader desire to advance a little way towards the understanding of those intricate problems which Britain, at any rate, must, for the safety of her own Asiatic Empire, help to solve.

Of the initial establishment of the so-called Chinese Republic it may be advisable to say a few words. It has already been recalled that the population of China is three hundred and fifty millions. Out of this teeming mass of humanity it is probably understating the truth to say that three hundred and forty-nine millions had at the time no idea whatever what a republic meant. That the establishment would bring a change in the form of government, or in the course of their own lives, or in their status as citizens never entered their heads. There are still to-day millions in China the sum of whose knowledge of what a republic means may be summed up by the statement that they only realise that a 'Son of Heaven' no longer sits on the throne of his ancestors. Beyond this, for the most part, is abysmal ignorance, a complete blank, a blank which no attempt has yet been made by the Central Government to fill.

When Yuan Shih-Kai was elected president, he became the hope of all who had the interests of the country at heart. He was then the one man who was capable of keeping China together, and of steering the new vessel through the stormy seas which threatened on all sides to engulf it. How he failed, and why he failed, it is not the purpose of this article to inquire. But he cannot be absolved from his share of the blame

* From the *Peking Leader* (Anniversary Supplement, 1920).

for the present condition of the Republic, for to him is due the initiation of militarism, to-day the curse of the country. He was responsible also for the temporary ruin of China's finances.

Having elected its president and evolved a paper constitution, the unfledged Republic was soon confronted with the Great War. In Europe the total demolition of familiar landmarks caused by the conflagration necessitated an entire rearrangement of international values. To the belligerents this was, comparatively speaking, plane sailing; they saw with grim determination that the only limit of each nation's war aims was, from the military standpoint, the utter destruction of its adversaries. For European neutrals the situation was less simple. For the Chinese, cut off in the Far East from the real truth of things, the situation was the most difficult of all. For China, the first set-back came when the attention of Europe was completely withdrawn from the Far East, and when the restraining influence upon Japan of Britain and America ceased to have a deterrent effect. As an Ally closely bound by the Anglo-Japanese agreement, it might have been thought that more than ever would Britain's preoccupation be the signal for a display of Japanese loyalty to the obligations imposed upon her by the terms of the treaty. That this was not so any one conversant with the twenty-one demands of the secret agreement forced upon the Chinese Government by Japan in 1918 is fully aware. Previously had come the refusal by the Allies, again at the instigation of Japan, of the Republic's offer to participate in the fighting of Europe. Added to this rebuff was the taking of Kiao-Chao by the Japanese, an exploit participated in by a few British troops, though it reflected no particular glory upon our army.

That the action of the Mikado's Government was purely political, and for the express purpose of stepping into German shoes in China after the war, hardly needs repeating, were it not for the fact that at the time of writing the questions of the rendition of Kiao-Chao and of German interests in the province of Shantung remain still unsettled. Finally came the ill-advised handling of the same problem at the Paris Conference after the Armistice by the victorious Allies, Japan participating.

Such, in brief, has been the experience of China at the hands of Britain, America, France, and Japan during the war. Many pages might be written giving in detail the causes for such treatment, but it is unnecessary here to labour the point. That China herself is to some extent responsible for her treatment is not denied, nor could Britain or America then spare a moment from the terrible struggle in Europe. But China having no real force at her back upon which to rely for defence against Japanese aggression, except the usual Oriental method of intrigue, it is hard to see what other result there could have been.

Nor, should it be added, is Japan blamed, if we judge her leaders solely from the point of view of political methods. Freed for the time being, or, as her militarists hoped, for a considerable period, from any interference on the part of Britain and America, why should Japan not pursue her long-cherished Asiatic policy? Though it is hard to imagine a more futile and less statesman-like policy, carried through in the face of Chinese Ministers equally astute as the Japanese, but entirely powerless to oppose such a policy. That Japan's attitude to the Republic during the war was in accordance with her unvarying Far Eastern programme may be a reason, but it can by no stretch of imagination be an excuse, for such a contravention of the Anglo-Japanese alliance as took place.

IV.

A few words upon the present position in Peking. It is considered advisable to substitute for the name of the country that of the capital, for the basic fact, which should be grasped before we proceed to discuss matters governmental, is that outside Peking the present Cabinet hardly functions. It is true that the President and the Premier represent the Republic whenever diplomatic relations take place with foreign Governments, or with foreign diplomats in the capital. But that, in any but the most shadowy sense, they represent the three hundred and fifty millions who make up the sum of all the provinces' tax-payers, no one who has been in China during the last year would venture to assert.

It may well be asked, who, then, does rule?

The answer is the military Tuchuns,* who are themselves bought and sold, as may be necessary, by one or other of the various cliques who from behind the scenes pull the political strings. In the south—that is, south of the Yangtze River—a second so-called Government exists, with Canton as its nominal capital. But this self-elected body no more represents the will of South China than does the Government at Peking that of North China. Each of the provinces is a law unto itself, and is dominated —governed is no word to use—by a so-called military leader. Under him flourishes a locust-like horde of worthless, cowardly soldiers. Soldiers in name only, for they are for the most part coolies, who are dressed in uniforms and carry modern rifles and ammunition, but who dread a real fight even more than they do an honest day's work. These so-called military leaders are in many cases themselves men of the common soldier class, who have risen to their proud, not to say lucrative, positions on the wave of crime and disorder which has continued to wreck the Chinese Government during the last five or six years. In the north, as well as in the south, these Tuchuns are

* Provincial military governors.

usually at daggers drawn. To defy Peking and the Central Government they come together temporarily, as suits their interests. They carry on so-called provincial campaigns, buying and selling so-called battles. In brief, in almost every province they make life a hell upon earth to all law-abiding peasants and merchants, upon which two classes rests, and always has rested, the hope of a regenerated China. To say that the internal administration of the country is hopelessly corrupt is to-day more than ever a mere truism. The military and civil organisation is in utter confusion, and until the two are again completely separated and made to reassume the position they occupy in every civilised Government in the world, progress is impossible. If this be not done, the day approaches, not next year necessarily, nor the year after (for we are discussing the East), but, as inevitably as fate, when outside intervention must come.

V.

There are, of course, alternatives to the present policy of misgovernment and corrupt administration in China. These alternatives take various forms, from a restitution of the monarchy to a reorganisation of the present Government under one or other of the most powerful military Tuchuns. There might even be a third chaotic revolution.

But salvation lies elsewhere.

In his latest book, *China, Japan, and Korea*, Mr J. O. P. Bland indicates the road to be followed.

'Any suggestion,' he says, 'for the reorganisation of China's finances and the reconstruction of the Central Government upon a new basis of effective authority must proceed in the assumption that the Commercial Powers chiefly concerned in the solution of the problem—America, England, and Japan—are sincerely desirous of solving it, and are prepared to co-operate to that end. In particular, it must be assumed that, given a clear indication of policy, the growing strength of genuine Liberalism in Japan will be able to bring sufficient weight of public opinion to bear upon the Jingo element of the Military Party to induce it to desist from further encroachments upon China's territory and sovereign rights. It may be objected that these assumptions admit of wide discussion. No doubt they do; nevertheless, they are not more Utopian than those upon which the civilised world proposes to reconstruct Central Europe, and they are much less involved.'

Upon these lines, and only upon such lines, can the future peace and prosperity of China be assured. A policy based upon friendly co-operation between Britain, America, and Japan would rally to its support the most patriotic, honest, and competent men of the younger generation. It would also be backed by the necessary wealth and co-operation of the merchant classes and of the all-powerful trade guilds. Such a policy would, without any attempt at direct control of China's finances, provide the corner-stone upon which the Chinese themselves could, if they would, raise such an empire as the world has never yet seen. But without foreign assistance the task to-day is beyond the Chinese. What Russia might have been, China can still be, if, while assimilating British and American progress, her toiling millions remain true to their own immemorial civilisation.

The hand of the iconoclast has dismembered Russia. The effort to create a Utopia on Lenin's lines has failed utterly. All that is best in China at the present day still springs from the ethical code of their great sage and law-giver, Confucius. It is not the first time an attempt has been made to put new wine into old bottles. Were we not warned, two thousand years ago, against such folly?

A solution must be found which, while fully preserving the integrity of China, will afford her the necessary staff upon which to lean during the weary period of her political convalescence.

If Great Britain, America, and Japan can settle their own Far Eastern differences, and, as the friends of China, will stand united behind her toiling millions while they rid themselves of the curse of militarism and reorganise their hopelessly chaotic Government, then is the world a long way nearer permanent peace.

MAN'S WORK.

By Alan Sullivan,
Author of *The Passing of Oulibut*, *Blantyre-Alien*, *The Inner Door*, &c.

CHAPTER VI.

I.

A FORTNIGHT later Shanklin went into Los Angeles for the first time in months. Life in the open had hardened him. There was a new depth in his voice, and his muscles felt like mild steel. Harrison's contract was finished and the well shot. To-morrow they would move to their own ground. He held a lease till the 1st of September.

He caught a motor-bus plunging northward from San Juan Capistrano, and, speeding past the Enterprise ground, saw but few signs of activity. Sitwell, it appeared, was hanging back,

and Shanklin wondered if it was for lack of the inheritance of a certain gray-eyed girl. He grinned at the thought; then, his mind turning to Claudia, he became unaccountably anxious. His worship of her, even though another man's wife, had only intensified as time passed. It was a thing settled and fixed, that he possessed no power to change, even if he would.

Descending at Los Angeles, he shouldered his way through the crowd, and turned quite automatically in the direction of Sitwell's apartment. Passing Burley's office, he glanced up at the lofty window from which he used to survey the Sierra Madre, and wondered who might be sitting at his desk now. His eyes softened a little as he recalled Burley's last words. Just at the present moment, however, he did not need legal advice, but money. There was twenty-five thousand dollars yet to be found. He walked rapidly, and halted in front of a well-known apartment-house. In a window of the sitting-room of the late Courtney Brooks was a sign: 'To Let Furnished.'

Shanklin stared at this for a moment, feeling, curiously enough, but little surprise. It was in line with the listless scene on the Enterprise ground. Gradually the revulsion came. At the entrance he found a boy lounging in the elevator.

After a moment's conversation he slipped out into the blazing street. The Sitwells had left a week ago—ejected for non-payment of rent. The furniture had been seized, and was held pending settlement. Their new address was in a side-street a mile away, and their letters were being sent. That was all the boy knew.

'I 'm sorry,' the youth went on with genuine regret, 'because I was here when her father died, and she was always nice to me. She was a daisy!' he concluded, with a burst of youthful loyalty. 'Friend of hers? Seems I remember your face.'

'Yes. I 'm a friend,' said Shanklin; and all the way for the next mile he wondered just what kind of a friend he could prove himself to be. Reaching the new address, he discovered it to be a small lodging-house. He hung about uncertainly, half hoping, half fearing to see her, and conscious that she was in need. A curtain seemed to rise for an instant, behind which she moved, vested with beauty and charm, but harnessed to a man whom her unshakable lover hated and despised. If life were difficult even in comfort, what must it be here? At the thought of that Shanklin revolted afresh.

His brain was throbbing with the renewed conviction that love was the one thing that mattered. Success, wealth, even triumph over one's enemies, were not comparable in value with the purity and power of the eternal flame. He himself was in desperate need of larger resources, but he was a free man, unshackled to any one who could burden or injure him. The reflection that he should have in any degree what this girl had not began to gnaw viciously into his brain. He was not forgetful of Harrison and all that hung in the balance, but here was something supremely instant and imperative. With one long scrutiny of the lodging-house, he walked quickly away.

An hour later he returned and rang the bell. 'Is Mr Sitwell in?' he asked.

The woman who opened the door shook her head. 'He 's never in at this time.'

'Then Mrs Sitwell?'

'Yes. Want to see her?'

'No.' Shanklin's face was half turned, and the brim of his hat pulled far down. 'But I 've a letter here—if you could give it to her.'

'Sure; but won't you come in and give it yourself?'

'If you 'd be so kind, it will be all right.' He handed her a long envelope, addressed in typewritten characters.

The woman glanced at him sharply, for the feel of the thing was unmistakable. 'I can't very well see who you are,' she said, her voice softening, 'but I guess—well—I 'll give it to her right away. Sure you won't wait?'

Shanklin only murmured a word of thanks and hurried off. The woman watched him till he turned a corner, then knocked at Claudia's door.

'A man just brought this for you, personally,' she said with evident interest. 'Wouldn't wait, or give any name. You 're looking white. Why don't you go out? Like something to eat right now?' Then, perceiving that, in spite of her thanks, Claudia only wanted to be left alone, she went out with an understanding little gesture of sympathy.

As the door closed the girl stared at the envelope, and slowly opening it, found ten notes of a hundred dollars each. She fingered them for a moment, her breath coming fast, with a queer feeling of unreality. They seemed amazingly potent. Presently her eyes rounded. Whence had this money arrived, meant so obviously for herself? Her thoughts flashed to Shanklin. It would have moved her very soul could she make herself believe that this was his gift—but she could not. She did not doubt that he still cared, but his resources were limited, and he would need them all, whatever pursuit he might be following. She ran over names of friends of her father's, and could think of none who might have done this. Edith Winter occurred to her, for, in spite of the Enterprise affair, she felt that with Edith there was a certain sympathetic bond of understanding, and even now it was still unsettled whether the Winters would invest or not. But the possibility that this was Edith's gift was too remote. Going over it all again and again, it seemed suddenly to her as though this might, after all, be Shanklin's way of showing his regret for

what had happened between her father and himself. But if he really regretted it, it was not like him to keep silent.

She thrilled at the possibility, for it was all there was left. In the past few weeks she had been initiated into a new worldly knowledge, and had faced realities as never before. The biggest of them was her husband, who was being gradually revealed to her by the stark pressure of events. There were no dreams unshattered. She began to see him as he was. Presently the door opened and he came in, with an expression she had learned to dread. She thrust the notes hastily into her pocket.

II.

If Shanklin was in Claudia's mind, no less was she in his on the way back to the valley next morning. He had had enough of the city for the time being. When he reached the property he found Harrison divided between unloading a wagon-load of derrick-frames and conversation with a stranger, at whom he jerked his chin as Shanklin strode up.

'Meet Mr Woolley, State Geologist. Mr Woolley, this is my partner Shanklin.'

Woolley held out his hand. 'You 've tumbled on a very interesting thing, Mr Shanklin. Was it as much luck as Harrison tells me?'

Shanklin laughed and took a swift glance. Woolley had a straightforward look that pleased him.

'It was pure luck—nothing else. I was loafing along the road, and heard Pettigrew, who owns this place, strike rock in an irrigation-ditch, where I thought there was hundreds of feet of soil.'

'But it might have been a boulder.'

'It didn't ring like a boulder would,' said Shanklin thoughtfully, 'and that started me thinking.'

Woolley looked at him with sudden respect. 'And then what?'

'Then I reckoned the anticline might have been faulted, if this rock was shale—and it was.'

Woolley nodded, took out a note-book, and sketched an imaginary geological fault. It was neat and workable, and did not much resemble the laborious product of a notable night weeks past, but its purport was the same.

'That 's what I make of it.'

Harrison laughed, felt in his pocket, and drew out Shanklin's sketch. 'This isn't so pretty, but it 's our picture.'

'It 's the same thing, and just as good.'

'Then how far do you reckon we have to go?'

Woolley dug his heel into the ground. 'Roughly about five hundred feet has been eroded here; that would leave you some two thousand.'

'Just what we calculated.'

'Well, good luck to you. If I can be of any use, let me know—that 's what the State pays me for. By the way, I see you 've got neighbours up the valley.'

Shanklin grinned. 'The Enterprise Company?'

'Yes—but'—Woolley hesitated an instant—'I think that would have been the right name for this property.'

He waved his hand and struck off up the highway. In his pocket was a fragment of shale, and in his mind was the knowledge that heretofore that shale had lain five hundred feet from the surface. It was patent that the partners had hit fair on a clean-cut fault, which so far had escaped his own trained observation. But, he reflected, he had no time in which to examine irrigation-ditches. If the thing was as he saw it, the result should be satisfactory.

He drove thoughtfully, stopping a mile and a half up the road, and made his way to the centre of the Enterprise ground, where Sitwell was deep in conversation with a carpenter. Woolley had known Courtney Brooks in years past, before he had formed partnership with his future son-in-law. The latter he knew only slightly, but Sitwell now welcomed him with what seemed an excess of heartiness.

'I was just hoping some one like you would come along, Mr Woolley. I want advice as to the best place to put down our first well—Enterprise No 1.'

Woolley shook hands. 'Glad to help you—if I can. Show me what you 've got.'

Sitwell waved his hand. 'Help yourself.'

The geologist's eyes made a swift survey. 'You 're a bit off the anticline, aren't you?'

'Yes; but this is the only thing Brooks and I could get—about here.'

'Was Brooks with you in this? I heard of his death a few weeks ago. He had a daughter, hadn't he?'

Sitwell nodded. 'My wife.' Then, after a little pause, 'As a matter of fact we 're both interested in this property, and I 'd be very glad of any suggestions you 'd care to make.'

This was more than Woolley had bargained for, and he thought rapidly. Courtney Brooks's daughter, as he remembered her years ago, had left a definite impression of childish charm and beauty. He wondered first if she had fulfilled her early promise, and then if her fortunes were linked up with this patch of ground. Finally he experienced a genuine impulse to help—if he could—and wondered inwardly whether Sitwell really wanted help as much as he said.

'You 're going to drill here?' he asked.

'Certainly.' There was a note of surprise in the word.

'Did you see a geological section of this territory, showing the anticline?'

'Yes; but not lately.'

'Then let me make you a rough one.'

Woolley pulled out his note-book, turning the papers till he came to a blank. Then he sketched a diagram indicating the anticline with its folded oil-sands and overlying strata, just as though a fist had been thrust up under a bed, distorting mattress, sheets, blankets, and coverlet into a long hump. On each side the strata dipped sharply. Near the edge of the page he made a cross.

'That cross roughly is your property. I don't know how far you are above the sands, if they reach here at all, which is doubtful. If you did strike them it would be a pumping proposition—no pressure.'

Sitwell made a little sound in his throat. He knew all this already, but it was no part of his game to say so.

'Of course, you're aware that in this district the oil underlies the shale. There's not much of the latter, but if you get it you're pretty sure of oil.' One hand closed round the fragment of rock in his pocket, and, intent on his argument, Woolley held it out. 'That's the shale. The sandstone is above it here; and sandstone is what I'd like to see, but I don't.

Sitwell's eyes narrowed. He had seen Woolley's car stop farther down the valley, for all day the road had been unusually clear, and from the Enterprise ground one could follow its slow curves stretching to the south-west. He recognised the character of the shale in an instant. It was freshly broken, and even geologists were not apt to keep samples in their pockets overnight. And yet Woolley had just said that in this district there was five hundred feet of sandstone on top of the shale. Sitwell's mind grew suddenly tense. In that case where did this sample come from?

'Do you want an honest opinion on your property?' asked Woolley slowly. He was thinking of Courtney Brooks's daughter.

'Of course I do.'

'Then save your money, and don't spend it here. I'm not speaking now as the State Geologist, but just man to man. You understand this isn't for publication? As a matter of fact it's immaterial to me whether you put down a well here or not. One place is the same as another.'

Sitwell flushed a little in spite of himself. He had asked for candour—and here it was.

'I'm only saying this privately—because—well, because I remember your wife as a girl. You're not offended, are you?'

Sitwell recovered himself. 'Not at all. Why should I be?' He hesitated an instant. 'Any suggestions of good prospecting-ground?' he asked casually.

Woolley's mind turned to Harrison, who had the real thing and knew what he was doing, and to Shanklin, whose sharp brain had solved the geological puzzle of what had become of the missing section of the great anticline. That was good, even brilliant, business. But this!

'We'd both appreciate anything you'd care to say, and I'm not speaking to the State Geologist either,' repeated Sitwell.

'I'm not justified in saying much, but I don't mind telling you that there is good prospecting-ground near here, and that's about as far as I can go. The rest is up to you.' He slipped the fragment of shale back into his pocket. 'Get after it, for, if you don't, I've an idea that others will.'

The promoter laughed. 'The state of California is nearly a thousand miles long. Which way do I move?'

Woolley climbed into his car. 'Don't follow me,' he grunted, and sped northward towards the city. He wondered a little whether he had said too much, but was honestly anxious to assist, if he could, a long-legged girl whose face and eyes had lingered for years in his memory. He thought nothing of the shale sample, being too accustomed to having such things in his fist, and, anyway, Sitwell was apparently too untechnical to draw any conclusions from its exhibition. The geologist's mind turned to the patch of short grass a mile from the great anticline. 'Enterprise!' he murmured disgustedly. 'That's the kind of enterprise that gives the business a rotten reputation. I wish old Brooks were alive; I'd talk to him. Didn't think he'd stand for it!'

And Sitwell, staring after the dwindling car with a little smile on his face, was also wishing old Brooks was alive.

III.

Something less than forty-eight hours later, Harrison, who was sweating in the sun with a monkey-wrench, threw the tool down and swore viciously. 'The trouble with this country is that labour is up in the air. You can't depend on it. These fellows think it's a favour to work for you at their own figure. Where's that carpenter we hired yesterday?'

Shanklin, who was levering a gas-engine on to its wooden bed, looked round and nodded. 'He must have lit out last night, and without pay, too.'

'He was the smartest man I've seen in a year. Now what do you suppose was the matter? Didn't take anything, did he?'

'No; there's nothing missing.' Shanklin straightened himself up, and just then an uncomfortable thought flashed into his brain. He paused a moment before speaking. 'Has it ever occurred to you that we're going about our job a bit carelessly?'

Harrison regarded his work. 'No, it hasn't; there's nothing the matter with this?'

'Come over here. I want to talk to you.'

The contractor recovered his wrench and

followed, wondering. A little way off Shanklin squatted under an orange-tree. His face was unusually serious.

'The rule of the road in this country,' he began, 'is that any one can go and look at any one else's work—especially so when it comes to putting down a well. Now we happen to have tumbled on to the only new thing in this part of the country, and it 's big enough to be kept quiet.'

Harrison sucked at his pipe. 'Perhaps you 're right.'

'I know I 'm right. That carpenter, for instance—he didn't want a job; he wanted information, and he got it.'

The elder man whistled. 'Whom for?'

'That 's what we don't know, but it 's out. As to your own crowd, I reckon they 're safe?'

'They ought to be. I 've had 'em six years—the three who know anything. I suppose we ought to let 'em into this?'

'Presently—yes; but not yet. In the meantime we run a closed shop; no one admitted to the ground, if we can work it. And, Harrison, I 've got a confession to make about money.'

'Not broke again?'

'No; but I 'm a thousand dollars short of what I figured.'

'Well, that 's a thousand more to find.'

Shanklin grinned. 'I thought I ought to let you know; that thousand may mean a good deal.'

'If we have any luck, we 'll start punching a hole in this shale in about three days,' murmured Harrison reflectively. 'Then you can get out and make up your shortage. But,' he added, 'I wonder whom that darned carpenter was really working for?'

SOME BRITISH BIRDS.

II.—BIRDS OF THE GRAVEL MARGINS.

By H. Mortimer Batten, F.Z.S., Author of *Habits and Characters of British Wild Animals*, *Tracks and Tracking*, &c.

I.

THE dipper is a favourite among all those who are familiar with its habitat and its habits. Best known to the angler, beloved of all who find relaxation by the water's edge, the dipper arrests the attention by its rapid flight and shrill, metallic note as it darts from one end to the other of its home reach. It is characteristic of this bird that it seldom leaves the water and flies overland, unless attacked by another dipper. Each bird or pair of birds has its own stretch of water, and any other dipper passing over that stretch is at once attacked by the rightful owners. To avoid actual conflict, the assailed generally swerves upwards in its flight, and thereby manages to dodge its aggressor; but should the latter prove equal to the ruse, the fugitive mounts still higher and makes for the bank. Immediately it is over the land it is evidently on common property, and is allowed to pursue its way unmolested. Like the water-voles that share their habitat, dippers are very conservative and very much of a stay-at-home disposition. It is, of course, hard to identify individuals, but the following are my impressions as regards the home-life of this bird.

A pair take up their quarters and build their nest. They breed early, and seldom produce more than one hatching per year. For a matter of forty yards or so above and below their nest they regard the stream strictly as their own, and savagely pursue any other dipper that trespasses thereon. If a neighbouring dipper insists on trespassing, this pursuit is backed with the utmost energy. They may follow the trespasser a hundred yards or more, both screaming shrilly, and performing flashing 'banks' and manœuvres, till, at a given point, the pursuer turns leisurely homewards—often to be attacked by another neighbour, or possibly by the first offender's wife. Thus, during the early part of the nesting season, when the male birds are on sentry-go, their pursuits of one another and their accompanying shrill notes are familiar scenes and sounds to all who know the streams they inhabit.

Though unknown on many English rivers, it cannot be said that the dipper population is unevenly distributed. In Scotland and the north of England it is one of the best known of water-side birds, and anywhere that clear running water exists it seems to be entirely at home. I have found them living at great altitudes the year through—managing to wring a living from some tiny stream, very often fouled with moss-water owing to its great altitude, and so high up, indeed, that the rattle-like croak of the ptarmigan is practically the only familiar sound amidst their mist-ridden surroundings. Yet here, as elsewhere, the dipper is the same merry little soul that we know by the sunnier waters where beach and oak vie with one another along the slopes.

It was only comparatively recently that man realised anything at all of what nature has practised for countless ages past in the art of camouflage. The nature-books tell us that the dipper is best known 'by his conspicuous white front.' Conspicuous? No. Could anything be

less conspicuous? A dipper, seated amidst his natural surroundings, is almost, or completely, invisible owing to that white front of his. If one sees the front at all, one sees nothing but the front. The rest of the bird is invisible against the dark background. If he is against a white background, one sees only his dark markings, and the white front is invisible; and whether it be only his white front or only his 'black' back that one sees, neither by itself bears any resemblance to a bird. So his colouring breaks his outline, and his invisibility lies in his 'conspicuous' markings.

A blackbird amidst the surroundings of a dipper is highly conspicuous, yet this little bird of the waterways, seated among his native pebbles, is invisible till he bobs. The habit of bobbing is very curious, and almost peculiar to birds of the water's edge—the sandpiper, the wagtail, and the dipper affording the three most striking examples. Why do they bob or waggle as they do? It strikes me as being an infectious habit, which possibly they have caught from one another, but there must be some very good reason for it. Is it that thereby they disturb and render visible the insect life on which they feed so largely? I hardly think so, as the dipper, at any rate, depends chiefly on aquatic larvæ. It may be that they are so well camouflaged that this waggling is necessary in order to enable them to find each other as they pass hither and thither in their rapid flight. At all events, I have repeatedly noticed that the appearance of a second dipper or of a second wagtail immediately has the effect of making the one seated at the water's edge begin to bob or waggle, as though to attract notice.

II.

The dipper rejoices in a vast variety of chosen haunts, but clear and shallow water is best beloved by it. Numbers of them bred in a deep gully near to the home of my boyhood. The mountain-stream was scarcely eighteen feet in width, and for a matter of two miles it wound its course through a deep gully which cut the range clean in two. The depth of the cutting varied from eighty feet to two hundred—a vault-like, dripping corridor, cool as a cellar, even in midsummer, fragrant with the spray of many waterfalls, and with the prolific growths of hartstongue ferns and rock plants that festooned every shelf. If one did not mind climbing and getting wet, one could traverse the entire length of the cutting, and many a happy day have I spent in its gloomy depths, studying the habits of the wild birds and the otters, for which it formed a natural sanctuary. The nests of the dippers were, I say, very numerous, though usually they were placed just out of reach. I remember how eerily the shrill call-notes of the old birds echoed along the passage-way.

Many young birds require little training from their parents. They take naturally to the habits on which they depend in later life, but the parent dippers may often be seen teaching their children how to find their food, flying with them from rock to rock, encouraging and calling: and these little family gatherings are very pretty to watch. The young birds leave the nest early, full of all the joy of life, and young and old together seem so much to rejoice in each other's company and to have so much to do that there is no time left in their happy lives for such things as dull care.

Truly the dipper is an inspiration, for, like the true jester, it finds mirth in its own merriment when all the world is dull. Not long ago, one dripping autumn evening, I paused at a small stream in order to look down from the bridge and see whether the salmon had returned to their favourite resting-places. But it was so dark and dim that I could not see below the surface. The very trees appeared to be drooping, and the cold drip-drip-drip from their branches seemed the utterance of their musing. Cat-ice hung about the rocks, and there was no sound in all the land save the metallic murmur of the stream.

But presently I heard a song—a rollicking, heedless little song, like that of a tipsy skylark—and there, seated on a boulder below me, I saw him. He was warbling just for the fun of being alive, when even the chickadees in the pine-grove had sought the sheltered nooks, and as I watched him he tumbled head over heels from the boulder into the stream, to reappear two yards away, mount another rock, and there sing again. Sunshine or storm, snow, hail, or gale, who has ever seen a dipper otherwise than falling over itself for the joy of being alive? Other birds may droop their wings and fall silent, but the dipper sings on, as though hunger were unknown to it, and mortal foes played no part in its existence.

Yet the dipper has as many foes as any other bird, though, owing to its aquatic habits, it is well able to evade them. I once saw a peregrine stoop at a blackcock near to a stream. A dipper happened to be passing at the moment, and as the peregrine stooped the dipper, though really in no danger, dropped like a stone into the water; nor did I see him again. I have no doubt that he rose eventually under the willows that overhung the stream at one side near to this point.

Herein, possibly, lies the reason why dippers, travelling from point to point, always fly directly over the water, following every turn of the stream. They are essentially water-birds, and the stream affords them the shelter that other birds find in the nooks and the thickets. I have seen old dippers, accompanying their heedless chicks, work themselves into a great state of agitation on the passing of a bird of

prey, and one could not help thinking that the show was necessary for the sake of teaching the chicks the meaning of fear, rather than because they were in danger. Young dippers, just able to fly, are very fearless. When fishing I have had them come quite near to me, pursuing their affairs in the most unembarrassed manner a yard or two away; and one could not help regretting that such goodwill towards man, even among the most lovable of our wild kindred, is necessarily limited to their unsophisticated youth!

But it cannot be otherwise. Not long ago I fell foul of a fishing competition, and I saw one of the competitors strike at a dipper with his rod as it flew past him. I asked him what good it would have done him if he had killed the bird, and he replied that he would have 'had it stuffed.' But for a well-founded realisation that in the unity of labour lies its strength, I might have tried the experiment of consigning this gentleman to the element from which he and his companions were hoisting salmon parr and infant trout for the glory of winning the 'sporting honours' of the day!

III.

Those who are familiar with the environment of the dipper know the sandpiper equally well. Both of them are generally beloved companions of the followers of the gentle art. One must live for a while in a birdless land in order to understand how much these birds add to their surroundings. In such a land one is at first merely subtly aware that something is missing—sadly missing. Then, after a while, comes the realisation, 'There are no birds!' and thereafter, even though one may not consider one's self a bird-lover, one is aware of a very real longing for their call-notes, and the sight of the bright presence.

I have lived in birdless lands. I know what the snow-buntings are to the North, which has its bitter pinch, even though they are present in their thousands. Once within my experience a great white owl settled on the trail ahead of our dogs, and even *its* sinister presence was welcome, since for weeks we had seen no birds, though the Indians who accompanied us declared the appearance of the great bird of prey to be a bad omen.

For myself, I know that the dippers, the sandpipers, and the wagtails have no little to do with the charm of the rivers and burns whose margins they frequent. The sandpiper does not hold an honoured place among the best-beloved birds of mankind, for the reason that so few of us are in intimate touch with it, but in character and disposition it is one of the most lovable of wild birds. Though, in a sense, wild as the March wind, it has no great distrust of man, and very soon a pair of these birds will come to know certain individuals, when their guileless trust cannot but win affection. Two of them nested one year in a strawberry-bed at the bottom of my garden, and so tame did they become that the hen-bird almost permitted me to stroke her while she was on her nest. So long as she thought me occupied, she would quietly sit her eggs while I worked within a yard or two, looking about her with her bright eyes, and occasionally pecking at an insect that settled near. Clearly she knew that I and my household would do her no harm, and if compelled to leave her nest, as she often was, she would merely run a few yards, and stand there, watching. Perhaps her mate would call to her, and together they would fly far out across the loch on trembling wings, apparently just for the fun of being together; but when the hen-bird thought it time to return, she would come back to her eggs and quietly take her place, even though she knew human beings were observing. Season after season I have watched the nesting of the sandpipers, and always I have been impressed by their devotion, as by their trusting and gentle ways. So far as I can judge, the parent birds share equally the task of incubation. While one sits the other watches, ever ready with an alarm. On the approach of danger the outlook bird works itself into a state of frenzied agitation ere the other deems it time to leave the eggs. In photographing the birds, one very soon learns that the male is much more timid than the female. He leaves the eggs immediately the shutter clicks, whereas the female, on hearing it, merely looks about her, then seems at once to forget.

In bird and animal photography it is particularly noticeable that it is the strange that frightens. If one can tune one's shutter so that its release merely resembles the cracking of a twig, the wild subject is not much alarmed; but with the click of steel, or the sound of a blind winding itself on a drum—types of sound entirely unknown in the wilderness—the sensation caused is instantaneous, and not at once forgotten. My experience is that it is not so much a matter of having a silent shutter as it is of having a shutter which makes such noise as it has to make *after* the exposure; and, providing it is the right kind of noise, the actual volume of sound does not matter much.

The sandpipers are the elected sentries of their environment, just as are the curlews and the redshanks in their different sphere, and I have specially noticed that these birds are abnormally restless on still, thundery nights. Whether it is that the weather has a direct effect upon the birds themselves, or whether it is that on such quiet nights they are more conscious of ominous sounds in their surroundings, it is hard to say. On certain still nights in June, however, the sandpipers are never at rest. Flying, alighting, calling, calling, the sandpipers' shrill notes haunt one's ears, and one knows that their chicks are just hatched, and that both parents are wild with anxiety lest some harm befall them.

PEPYS AND HIS LIBRARY.

By E. Beresford Chancellor, M.A.

JUST as Samuel Pepys occupies a position which is unique in the annals of literature, so does the library which he collected with such care and bequeathed to the university of Cambridge stand alone among the innumerable bibliographical legacies which have been left by private collectors to public institutions. Pepys, the most human and outspoken of diarists, has become a legendary figure, but it is a legendary figure ramparted about with so many human touches—there is so much of him in every one of us—that we have come to regard him not as the busy man of affairs, not as the hard-working, painstaking Secretary to the Admiralty, so much as the outstanding example of a large section of humanity, rather vain, very complacent, a compound of high ideals and petty acts, a good, straightforward, intensely prejudiced, rather narrow gentleman, perfectly satisfied with himself and his position, his clothes, and his collections, and not wholly indifferent to the swish of the 'tumultuous petticoat.'

It is probable that there is little hid from us concerning Pepys's life, his hopes and fears, his predilections, or his dislikes. Since the great Diary was first translated from its original shorthand, and a human soul was found to be underlying that mass of documentary evidence of a day so far distant, all sorts of searchlights have been directed on to the character of its writer, and his personality has been subjected to every conceivable variety of test. From this trial Samuel Pepys emerges a greater man than many have been inclined to allow. His littlenesses, his weaknesses, serve but to accentuate his essential and fundamental capacity, and, like the Rousseau of the 'Confessions' (although he never descended to the meannesses of the Frenchman), he emerges, in spite of his outspoken avowals, a man of parts, of intelligence, with an admirable power of seeing the life of his period sanely, and seeing it whole. We may count ourselves lucky in the fact that he was not a greater man, for, had he been, it is probable that we should have then had a diary like that of Evelyn, valuable as a record of an interesting period in our history, but as lacking in the human touch, as cold and precise, as that which the author of *Sylva* has left us. Coleridge, in one of the marginalia in his copy of Pepys's Diary, wrote: 'He was a *pollard* man, without the *top* (that is, the reason as the source of ideas, or immediate yet not sensuous truths, having their evidence in themselves; or the imagination or idealising power, by symbols mediating between the reason and the understanding), but on this account more broadly and luxuriantly branching out from the upper trunk.' It was difficult for the poet to make a plain statement clearly, but one sees what he means, and we can, I think, leave Pepys's character at that. But few things give a better idea of a man than the books he collects and his manner of handling them, and in the Pepysian Library at Magdalene College, Cambridge, we shall probably gain a juster estimate of Mr Secretary Pepys than from any number of philosophical observations, even from so great a genius as Coleridge.

The most unimaginative must feel something of a thrill as he enters the old-world, oak-panelled rooms in which are preserved the books collected with such care by the man whose name has become a household word, and whose personality has such an enduring hold on the minds of most of us. There stand the famous oak book-cases, eleven in number, which he caused to be constructed, and which gave him such 'extraordinary satisfaction' when he received them on 24th August 1661, and within them are the books, remaining exactly as he left them, arranged in the precise order in which he had placed them. As one gazes at these mute evidences of the diarist's care and orderliness, all sorts of entries from his diurnal record spring to the mind. 'Dec. 17, 1666. Spent the evening in fitting my books,' he writes, 'to have the number set upon each, in order to my having an alphabet of my whole, which will be of great ease to me;' and again: 'Feb. 4, 1667. Home, and to my chamber, and there finished my Catalogue of my books with my own hand.' And so on—as when he gets his brother to help in the cataloguing, or when the whole household is pressed into service 'titeling' the books for the year, with the result that they all tired their backs, but completed the work 'to my very good satisfaction.' There we stand in the midst of the collection, arranged and 'titled' as Pepys left it; neat and methodical as was the mind of its collector; catholic in its large embrace of all sorts of subjects, as his tastes were catholic.

The book-cases themselves are things to delight in. Handsomely carved, with handles at each end for convenience in moving them; their doors are formed of little panes of glass, the glass in the lower divisions being made to lift up. All the books are in double rows, the smaller ones in front, so that the titles of all are visible. Some of the books have tickets outside, and as we notice this fact we recall an entry in the Diary which reads: 'To my chamber, and there to ticket a good part of my books, in order to the numbering of them for my easy finding them to read as I have occasion.' So far as regular arrangement is concerned, this did not

consist so much in classification as in placing the volumes in order of size; and as a proof how carefully this was carried out, we find some short volumes mounted on blocks, gilded over, in order to raise them to the required height. One can imagine Pepys complacently reviewing his treasures after they had thus been set uniformly; and I dare say he found as much pleasure in regarding his regiments of gilt leather as he did in the perusing of their contents.

For, truth to tell, his taste seems to have been better in accumulation than in actual reading. Every one knows the story of his struggle to appreciate *Hudibras*: how, in converse one day with Mr Battersby, the discourse fell on this 'new book of drollery'; and how Pepys must needs go and buy it, picking it up in The Temple for two shillings and sixpence; and how he found it 'so silly an abuse of the Presbyter knight going to the warrs' that he was ashamed of it, and later in the same day sold his copy to Mr Townshend for one shilling and sixpence. When the second part came out he tried again to like it, as the 'world cry it up so mightily,' but did not succeed. In this instance, wise by experience, he only borrowed the book. Later on his qualms returned, and he bought both parts to place in his library. As, however, the copy which is now there is of the 1689 edition, he must have got rid of this second purchase, and finally procured another example.

Once he bought 'an idle, rogueish French book,' entitled *L'escholle des Filles*, in the Strand, but resolved, after reading, to burn it, in order that it might not disgrace his books if it should be found among them. He was, too, uncertain as to Rochester's poems, and at first would not admit the volume among his treasures; but, as Mr Wheatley attests, it is there, bound and lettered 'Rochester's Life'—an example of hypocrisy on the part of our collector which many, I suspect, could match from similar experience of their own or their friends' collections.

The books in the Pepysian library number just three thousand, and as the diarist determined not to have more than his presses would hold, he probably from time to time got rid of surplus volumes, which would, no doubt, account for the absence of certain works which one might have expected to find in such a catholic assemblage. Many of the books were specially bound for him, and when this was the case his arms are found stamped on one side, and his name on the other. References to the Diary will bring to light the names of various binders employed, just as are to be found there the names of the booksellers with whom Pepys dealt, Kirton being one of those chiefly patronised. Among the books not rebound one may instance a small missal in two volumes, the binding of which may conceivably be from the hand of the great Mearne, to whose work it bears a strong resemblance.

Pepys had two book-plates, one containing a portrait of himself by Robert White, the engraver; the other representing his initials with crossed anchors in a design formed by ropes. It was his practice to place one of each in every volume he owned—the portrait-plate in front, on the back of the title-page; the anchor-plate at the end of the book.

Apart from the personal interest of the Pepysian library, it possesses an immense value from the number of rarities it contains. For instance, there are no fewer than nine works from the press of Caxton, as well as several examples of Wynkyn de Worde, Pynson, and other early and rare printers. There are, too, the five volumes of old English ballads, embracing the largest series of broadsides ever brought together, exceeding in bulk and importance even the famous Roxburghe collection in the British Museum. On the title-page of this wondrous assemblage Pepys has himself written these words: 'Begun by Mr Selden: Improved by ye addition of many Pieces elder thereto in Time, and the whole continued down to the year 1700, when the Form till then peculiar thereto, viz., of the Black Letter, with Pictures, seems (for cheapness sake) wholly laid aside, for that of the White Letter, without Pictures.'

Besides this collection, there are volumes of tracts on the Popish Plot, six in number, and practically complete; four volumes of sea-tracts; and a large assemblage of news-pamphlets from January 1659 to January 1666. Topographers —especially London topographers—will rejoice, too, in a couple of thick folio volumes filled with prints and engravings on the London of Pepys's own day and of preceding periods. The diarist seems to have been the first to collect such illustrations of the city's history—a characteristic which has not received its due meed of appreciation. He left these volumes to his nephew, who also added to them.

This fact brings us to the reason why the whole of Pepys's collections are now at Magdalene College. At his death he bequeathed them, in the first instance, to his nephew, John Jackson, with a proviso that they should on no account be dispersed. Jackson was to have a life-interest in them, and at his death he was to leave them to one of the universities, at his discretion; but Cambridge, Pepys's *alma mater*, was to have the preference. In any case, a private college rather than a public library was to be selected, and of the colleges, Trinity and Magdalene were to be preferred over others, and Magdalene (Pepys's own college) was to have a prior claim. It was also arranged that whichever college did not benefit by the legacy was to be appointed visitor, and if at the annual inspection any breach of covenant was discovered, the library was to be forfeited to the visiting college.

Pepys was nothing if not a business man; and nothing attests his acumen in this respect

better than the careful provisions of his will, by which he ensured, as completely as was humanly possible, the safe custody for ever of his beloved books.

The Pepysian library differentiates Cambridge more completely from Oxford than does even the glorious pile of King's College Chapel or the incomparable beauty of the 'backs.' It is *sui generis*. No other collection is exactly like it; for as you enter its precincts you are, as it were, wafted into the spiritual presence of the immortal diarist. Through the pages of his famous record he seems intimate to us as few of the past have become intimate; but here, somehow, among the books he loved and handled he is almost more intimate still; and a thought of that ghostly, but still genial, presence will give pause to the most careless, should they be moved to handle even the most insignificant of the treasures roughly—for these were the solace and delight of one who, by his writings, has given to so many of us delight and solace.

VOLCANOES FOR GARDENING.

By Derek Ingram.

PARADOXICAL as it may appear, volcanic disturbances serve to enrich the country and to fertilise the soil. The New Hebrides, where volcanic eruptions are quite frequent, are richly productive of the fruits of the earth, products which it is practically impossible to grow in this country, such as bread-fruit, yam, copra, and the sago-palm. A few years ago the island of Ambrym, one of the New Hebrides, was running with molten lava; to-day its vegetation is more abundant than ever.

We are not suggesting that the Saturday afternoon gardener should arrange for a miniature explosion beneath the surface of his beloved soil, for, even if he could dig so far as to reach the valuable mineral properties of the earth, it would be some generations hence before any appreciable benefit would be derived. Nevertheless, it is a fact that the streams of lava, or molten rock, which flow down the mountain-sides and over the neighbouring country after a volcanic eruption render the soil extremely rich in course of years, owing to the presence of chemical fertilisers. When the earth was younger, and the solid crust considerably thinner than it is now, there were many extensive eruptions, due to the rending of the crust along huge fissures, often hundreds of miles in extent, and around the sites of these disturbances fertile valleys exist to-day.

Of course, fresh lava is absolutely unfertile, but, as its rocky surface begins to soften under the influence of climatic conditions, vegetation appears. Tourists who have visited Vesuvius will recall that, although the slopes of the mountain are barren almost to the base, the surrounding district of Campania is extremely rich; so much so that, despite other people's fears of a serious outbreak from the old crater, the local population is dense.

Just before the war, Dr Kleiber, head of the Chemical Institute at Zurich, discovered that the ashes covering Pompeii and Herculaneum contained large quantities of potash and argil. All over the district around Vesuvius these excellent fertilisers are to be found on the surface. Potash was at that time a monopoly in the hands of a German syndicate, which supplied the whole of the Continent. This discovery, however, broke the trust.

It is a remarkable fact that the country surrounding the city of St Pierre, in Martinique, is now thickly clothed with forests; barely twenty years ago a fearful volcanic outbreak destroyed nearly forty thousand of the inhabitants in a few minutes. Even the slopes of Mont Pelée itself, the volcano which produced this holocaust, are now richly covered with vegetation. In the vicinity sugar-cane, coffee, cocoa, tobacco, and cotton plants flourish in abundance. A letter from a naval officer who visited the ruined city some ten years ago declares that where lava formerly poured along, mangoes were growing in abundance, the trees sometimes sixty feet high. Any one who has essayed the cultivation of this plant in England knows that it requires an extremely rich soil, with loam and peat as ingredients.

A still more amazing example of the fertilising properties of volcanic eruptions is found in Mount Brazil, in the Azores, which many years ago used to belch forth vapour and ashes. It is not very difficult to ascend to the crater, where one looks down into the bottom of a cavity about a mile in diameter, the highest point being about one hundred and seventy yards from it. There are two depressions of unequal depth, as if the volcano had burst out at different times. Now fields of maize cover the lower part of the concavity, thousands of beautifully bright amaryllids adorn the interior slopes, and in the autumn form splendid decorations with the rosy corollas. In picturesque contrast, the roads in the crater are formed of a vitreous sand, with yellowish-green reflections and black crystals, which sparkle in the sun. This rich garden is at times the settling-place of swarms of locusts, which come from the African shore and carry devastation with them, and yet these depredations are of no avail, for the place bursts forth into a glorious blaze of colour at regular seasons.

LOW TIDE AND ROCK POOLS.

By CONSTANCE M. TROY.

LAST evening I came to the edge of the cliffs and looked over; the tide had gone out—gone out silently over the sands of yesterday. So I went down upon the sands, which stretched along as far as the eye could see, wet and sodden. The tide had left behind many salt pools among the rocks, little mirrors of the past.

I stood for a moment watching a gull, circling, dipping, rising, swooping, and I listened to his piercing, lonely, yet half-musical whistling, which, here in this lost haven of forgotten years, reawakened a longing for the old sunny dream-years of my childhood.

I went in search of one of the little pools, and found a tiny one in a slimy rock-basin, with a star-fish filling most of it. I gazed into the shallow depths, where a vision formed before my eyes. A sweet-faced, laughing woman was guiding a stumbling little baby along those sands, striving to keep it from falling on its stubby nose. Presently a man joined them, a great, tall, strong man, and he tossed the baby on to his big shoulders and let the chubby hands tug at his moustache. It was a sweet picture of sublime happiness, and I turned from it with an odd feeling in my throat.

The next puddle was a little larger, but a minnow, left behind by the tide, was stirring up the mud and making the water murky. But I could see the woman and the child; the man was not there now. He had gone away, and would return no more. The child, a little older, did not understand; but the mother—ah! the mother! She knew why his step sounded no more; she understood why he didn't come with some funny rhyme to kiss his wee daughter good-night; she knew why his pleasant, deep-voiced laugh was never heard now. Yet, with the knowledge of all this tearing and rending her heart-strings, she put aside her own grief to comfort her baby in the first great sorrow of her childhood.

The kitten was dead, and no one knew how it had died; but it was dead, and the little girl was very unhappy. The mother had helped her to dig a tiny grave in the garden, and had wrapped it in one of her own handkerchiefs; after which she had taken the little girl in and rocked her and sung to her till the wound began to heal, and they made arrangements about getting a new kitten, which, while it could *never* take the place of the first one, would at least help her to forget.

I lived that time over again, all that bitter anguish of the first stone in my path, which had been brushed away by a mother's kisses.

Slowly I went on over the rocks till I came to the next pool. This time the child had been naughty, very naughty indeed, and the mother was displeased. The child, perhaps eleven years old, was going to school, and, with the thoughtlessness of most children, did not realise what it meant to her mother to send her, for it was a good school and cost money. She had made great sacrifices for her child, but the child was so careless, and would not do as she was told, and the poor little mother was almost discouraged. But she realised what it would mean to the girl and woman of the future years, so she punished the child, though it nearly broke her heart; and later on the child came sobbing to say she was sorry and to ask forgiveness.

Forgiveness! That wonderful power! Happy the child who has known a mother's forgiveness.

But the water of the next pool was not so smooth. Looking down, I saw the reason. The child, now a girl of about seventeen, had left behind her the smooth sand. She had come now to the foot of the cliffs, and here the ground became rough and stony. The girl was puzzled by this change: up till now the way had been so smooth, so easy to skip along, and the sunshine had been so warm. Now there were a few shadows, and the girl found it difficult to get along. But her mother walked beside her, her arm around the girl, explaining the shadows of life, and leading her gently round the boulders that in her youth she would have stumbled against.

And as they went the girl's brow cleared; the sunshine came again, and the shadows had no terror for her. She became very happy, and the knowledge of all her mother had done for her made her love burn brightly in true gratitude and understanding.

And so I came to the last of the pools. The pair were climbing arm-in-arm the path of the cliffs. Just ahead were a pair of golden gates

 [*All Rights Reserved.*]

and when they reached these, the mother, tired-looking, but smiling, opened them, and the daughter, leaving childhood and girlhood behind, passed in to strong, pure womanhood.

She turned and held out her hand, to draw her mother in with her, but the mother gently shook her head, and closing the gates again, turned away with a happy sigh. The hardest part of the journey was finished; her work was done—well done. She had brought her daughter safely to the gates of womanhood, and, tired and worn, she had gone to join the man she loved, who waited for her out beyond the margin of the sea.

With a feeling of awful loneliness I turned, to find the water stealing in again. I went up the path, and when I reached the top of the cliffs I looked back. Far below, the sea was tumbling over the rocks. Somewhere under that raging water lay the sands of yesterday, They were gone, and I was powerless to save them, and so I turned away.

Under the light of the full moon the fields of the future looked cold and desolate, but no doubt to-morrow's sun would change them and make them bright. And so I went towards them alone, my heart full of love and the memory of the lost haven of forgotten years, by the edge of the summer sea.

MAN'S WORK.

CHAPTER VII.

THE carpenter's employer was at that moment approaching his boarding-house, in a side-street in Los Angeles. He walked quickly, and his step was light. Once inside, he raced upstairs, and found his wife seated by the open window. The day was warm. As Sitwell entered she glanced at him curiously. She had seldom seen him so animated—not, in fact, since the first day of the Winters' visit. He kissed her, and began to stride up and down the room. Presently he pulled up a chair close beside her.

'Claudia, I want to tell you something. It's important for both of us; and I want your help.'

She shrank instinctively. Was this another twenty thousand dollar inquiry? He seemed to interpret her thoughts, for he went on at once.

'Before asking you to help, let me go back a little. You thought I treated you badly over that Winter affair. Perhaps I did; but I felt you might have done more to keep them at the apartment. You knew how tight things were.'

'I did,' she protested; 'but I won't abuse the confidence of perfect strangers. I leave that to you. I don't know anything about the Enterprise business—except,' she added cynically, 'what you've told me.'

He flushed at that, but retained his poise.

'I'm willing to let bygones be bygones, if you are. I'm sorry if I was unkind. I didn't mean to be. I was wrought up with anxiety. And the Enterprise——'

'Well?' she put in.

'Isn't what I thought it was. I got that yesterday on the highest authority. At the same time I got a hint of something infinitely better and bigger.'

She stared at him intently. If he had only thought the Enterprise was good, how could he have spoken to the Winters as he did? Had her father only thought so too? With this came the blinding conviction that Shanklin had been right. She felt a little sick, and leaned back in her chair.

Sitwell glanced at her anxiously. 'What's the matter?'

'Nothing! Go on.'

He paused for an instant, noting the pallor of her face and the throbbing pulse in the white throat. But this time he was genuinely in earnest, more in earnest than he could remember having ever been before.

'I've a chance now to catch up and get out for good, if I can work it. A discovery of great importance has been made about a mile from the Enterprise—oil-shale on the surface. It's part of the big ridge on which you saw the producing wells. You couldn't understand it technically, but it really means that what has been found on that ridge will be found on that patch of shale.'

'Who told you all this?' she asked. This sounded more real than anything he had ever told her about his business.

'Woolley, the State Geologist, suggested that if I went south I'd find something better, and'—he hesitated—'I did. I can't use his name. He only gave the hint because he knew your father, and you too, years ago.'

Claudia puzzled, then dimly recalled him, but it was only a childish memory.

'And you got it?' she asked, with a lift in her voice.

'No, not yet; but I'm the only man who knows about it, except Woolley and the present lessees. Now, listen! They are two prospectors who have very little money, most of which has gone into purchasing an option, which runs out in about three months. They've got to get this well down by then, because their option won't be renewed. I've bought the renewal with all I could lay my hands on, and it's an impossibility for them to win out. With that property I can get any sum I ask; and even with the prospect of it I can get all the backing I want. It's literally a slice cut clear out of the richest oil-sands in California.'

'But what about the Enterprise? Have you abandoned it, then? And what about the people who have bought stock? I'm a large stock-holder myself.'

'I was coming to that. I used some of the Enterprise money to get that option. It was in the interest of the stock-holders, and will be officially confirmed.'

She stared at him, amazed. 'Can you do that without asking them?'

'It isn't regular, but I've done it,' he said coolly.

Her hands moved helplessly. 'Is there anything else?'

'Yes; and the most important part of it. I've got to go to New York to see Spencer Martin.'

'Who is he? And why?'

'Spencer Martin is one of the biggest and pluckiest oil operators in the States. He has wells in Central America, Pennsylvania, and Texas. He's tried California several times, but didn't get in soon enough. I know he wants to get in, because there's war on between him and western operators. That's why he'd go a long way to find something. I can't write him all this, so I've got to see him, and I can't see him till I get some money.'

She did not answer, for her mind was pitched on the packet of notes hidden away in her room. Had Sitwell mysteriously divined their presence? Certainly he had not seen them. Something in her responded, in spite of all that had passed, to his earnestness, and she admitted with shame that now he talked like an honest man. Then doubt assailed her anew.

'My idea is'—her husband was speaking slowly—'that, if possible, we both go to New York. If nothing comes of this, I'm ready to turn over the Enterprise affair to the other directors, and get a job in the east and settle down. If something does come of it, then we are justified in going.'

His smooth face betrayed only a sincere desire for her company and encouragement, and a readiness, should this venture fail, to take up a less risky method of life. This last possibility gave her a vivid gleam of hope.

'How much would it cost?' she asked nervously.

'Including expenses in New York, say for three or four days, about six hundred dollars. Then you'd need some things. I wish I hadn't sacrificed that car,' he added reflectively.

Six hundred dollars for the chance of getting rid of the nightmare life she was leading! She searched her husband's face again.

'Of course, the Enterprise Company won't make any trouble if this thing goes through,' he said, as though speaking of the action of some outsider; 'but if it doesn't, they possibly may.' His eyes caught hers and held them. 'I have to remember that.'

She stood up and put her hand on his shoulder. 'Bertie, will you give me your word of honour about something?'

'What is it?'

'That whether this thing goes through or not, you'll get out of promoting companies. You know what father felt and said. We all considered that Mr Shanklin was disloyal—to say nothing of making himself ridiculous—and he paid for it—but Mr Shanklin was right. If he was here I'd tell him so. Do you know where he is?'

Sitwell's pulse fluttered a little. If Claudia only knew! 'No,' he lied.

'I want to be honest with you, as I think this afternoon you've tried to be with me. You don't know how it has all hurt. I didn't marry you, Bertie, because I loved you—for I didn't love you—but because father wanted it. Did you ever guess that?'

He had known it all along, but his ambition dulled his sensibility. He stared in her face. 'No,' he said again.

Her lips contracted with pain. 'Well—it's true—and because, perhaps, I owe you something for that, I'll help now—if you give me your promise. If there was any love between us I couldn't talk like this, but you've killed whatever there might have been.'

Sitwell, still gazing at her, had a blinding vision of what might have been. Her loyalty, her courage, her honesty, her wistful appeal, the supreme frankness of her spirit—all these he might perhaps have won and kept. He began to perceive that all his life he had shut his eyes to the things really worth while. He had nothing left to offer in exchange for the gifts she once extended to him, but now definitely withdrew. And even as she moved in spirit and thought farther away from him, so did she become the more attractive and desirable. And yet it was his pride which was hurt the most.

She went into the next room, and returned with six notes of a hundred dollars each. 'You must not ask any questions about this money. It's mine.'

He stiffened with surprise, but she went on quietly. 'I give it to you to save us both—and find a way out. When do you want to go to New York? I'll come.'

Sitwell, with the money in his fingers, could find not a word in answer. His brain was racking itself with questions. Swiftly he ran over the names of their acquaintances, then pitched on one that seemed to stand out in flaming letters. What if it was Shanklin! The irony in the idea was so sharp and pointed that it made him a little breathless. And Claudia had said that now she would like to tell Shanklin that he had been right. There was much that he wanted to say, but it seemed suddenly wiser to say nothing.

'We'll go as soon as you are ready. Will to-morrow do?'

'Yes.'

'Then I'll see about berths now.' He went out, closing the door with unusual deliberation. She did not even look up, being exhausted with the tenseness of the moment. She longed with her whole soul for some faithful breast on which to forget the utter loneliness of her spirit. She felt within herself a capacity for companionship, love, and passion that would never be fulfilled, and dreaded those long hours during which the incense of life would be fruitlessly dissipated.

A little later that day came a letter from Edith Winter, in Catalina. Claudia opened it with pleasure. The Winters were awaiting the arrival of a friend from the east, who would advise them about investing in the Enterprise, and hoped that the delay would be quite understood. The girl went on with a bright account of her present surroundings and her growing love for California. She concluded with an affectionate personal message that came straight from her heart.

Claudia sat for some moments deep in thought. She had assumed that the Winters had decided not to pursue the Enterprise matter any further, and, in spite of the situation thus created, the reflection relieved her. But now she knew that the Enterprise was not worth considering—and Edith didn't. She dwelt uncomfortably on this, till, gradually, there unfolded itself the parallel between her present position and that in which her lover found himself months ago, while in her breast sounded the small voice Shanklin had heard as he stared at the title-deeds of Courtney Brooks. And it was not till Claudia was stirred by this persistent whisper that she began to perceive what his action must have cost the man whom she now admitted she still loved with secret fervour. The small voice persisted in minute distinctness. Here was the situation! What was she going to do about it?

Gradually it became quite clear that this was an obvious opportunity to do the right thing, the thing worth while. She must cast her bread upon the waters, and leave the rest to destiny. The letter she wrote depicted nothing of the stress under which she laboured. She expressed the hope of seeing the Winters when they came back from Catalina, and suggested other interesting places to visit. As to the Enterprise, she said: 'Will you think it very strange if I tell you that I'm disappointed so far? I have a large number of shares left me by my father, and I'm afraid it's not going to turn out what we hoped.'

She read this over twice, nodded, and sealed the envelope. Then, quite automatically, she opened a drawer and took out a photograph that in days past had rested between the pages of *Marcus Aurelius*. Shanklin's face smiled up at her with its confidence and candour. Her own eyes grew misty, for his lips seemed to be moving, whispering that she had done right.

(*Continued on page 187.*)

THE SEVEN LAMPS OF ADVOCACY.

By His Honour Judge PARRY.

III.—THE LAMP OF INDUSTRY.

The Seven Lamps of Advocacy are *Honesty, Courage, Industry, Wit, Eloquence, Judgment, and Fellowship.*

I.

THE first task of the advocate is to learn to labour and to wait. There never was a successful advocate who did not owe some of his prowess to industry. From the biographies of our ancestors we may learn that the eminent successful ones of each generation practised at least enough industry in their day to preach its virtues to aspiring juniors.

Work soon becomes a habit. It may not be altogether a good habit, but it is better to wear out than to rust out. Nothing, we are told, is impossible to industry. Certainly without industry the armoury of the advocate will lack weapons on the day of battle.

There must be years of what Charles Lamb described with graceful alliteration as 'the dry drudgery of the desk's dead wood' before the young advocate can hope to dazzle juries with eloquent perorations, confound dishonest witnesses by skilful cross-examination, and lead the steps of erring judges into the paths of precedent.

All great advocates tell us that they have had either steady habits of industry or grand outbursts of work. Charles Russell had a continuous spate of energy. Many of us can remember him, tireless and active himself, bustling into the robing-room at St George's Hall, Liverpool, and finding several members of the Junior Bar standing around the fire.

'Why are you loafing about here?' he asked. 'Why don't you *do* something?'

'We have nothing to do,' said the Junior Bar.

'Why don't you go to the races?' he rejoined. '*Do* something!'

Abraham Lincoln owed his sound knowledge of law to grim, zealous industry. As a storekeeper he studied Blackstone out of shop-hours, perched on a wood-pile or lying under a tree. On circuit, in the bedroom of the village inn, a candle at his head and his feet protruding over the foot-board of his bed, he lay reading law until two in the morning, undisturbed by snoring comrades. When possible, he would

read aloud, for thus, he said, 'two senses catch the idea. First, I see what I read; second, I hear it, and can therefore remember it better.' In after-life to every student who came near him his advice was, 'Work! work! work!'

Advocacy is indeed a life of industry. Each new success brings greater toil. Campbell, writing home from the Oxford Circuit, describes the weary round of his daily task. Some advocates suffer thus every day the court sits, whilst others sit round and suffer envy.

'I ought to have got so far to-night on my way to Hereford, but we have a long day's work before us, and I shall be obliged to travel all to-morrow night. You can hardly form a notion of the life of labour, anxiety, and privation which I lead upon the circuit. I am up every morning by six. I never get out of court till seven, eight, or nine in the evening, and, having swallowed any indifferent fare that my clerk provides for me at my lodgings, I have consultations and read briefs till I fall asleep. This arises very much from the incompetence of the judge. It is from the incompetency of judges that the chief annoyances I have in life arise. I could myself have disposed of the causes here in half the time the judge employed. He has tried two causes in four days. Poor fellow, he is completely knocked up.'

II.

An advocate must study his brief in the same way that an actor studies his part. Success in advocacy is not arrived at by intuition. Mr O'Brien, in his excellent biography of Charles Russell, details an interesting conversation with his hero which enforces this truth. He had raised the question of an advocate succeeding by mere intuition in picking up the threads of a case in court, when Russell interrupted him in a characteristic phrase. '"That's all nonsense," he said. "You don't know anything by intuition. You have to work hard and to think hard. I get some good help, as I tell you. My mode of work is this: One of these young men reads the brief and makes a note—a full one. I go through the note with him" (smiling), "cross-examining him, if you like. Sometimes, I admit, it may not be necessary for me to read the brief; the note may be so complete, and the man's knowledge of the case so exact, that I get everything from him. But it often is—in fact, generally is—necessary to go to the brief. You have seen me reading briefs here. I admit that I am quick in getting at the kernel of a case, and that saves me some trouble; but I must read the brief with my own eyes, or somebody else's."

'I said, "Sir John Karslake went blind because he could only read his brief with his own eyes. It is a great point to be able to read your brief with somebody else's eyes!"

'*Russell*—"Well, well, well, that's so! but it is not intuition."

'I said, "It has been said that O'Connell never read his brief when he appeared for the defendant. He made his case out of the plaintiff's case."

'*Russell*—"I don't think that is likely; I think O'Connell knew his case—the vital points in his case—before he went into court. There is often a great deal in a brief which is not vital, which is not even pertinent. I can read a brief quickly; I can take in a page at a glance, if you like; I can throw the rubbish over easily, and come right on the marrow of the case. But I can only do that by reading the brief, or by the help of my friends. I learn a great deal at consultations; I am not above taking hints from everybody, and I think carefully over everything that is said to me" (holding his hand up with open palm); "I shut out no view. If I have a good point, it is that I can see quickly the hinge on which the whole case turns, and I never lose sight of it. But that is not intuition, my friend; it is work."'

III.

Industry in reading and book-learning may make a man a good jurist, but the advocate must exercise his industry in the double art of speaking and arranging his thoughts in ordered speech. He must be ready to leave his books awhile and practise the athletics of eloquence with equal industry.

The silver-tongued Heneage Finch advises students 'to study all the morning and talk all the afternoon.' Old Serjeant Maynard, deeply learned in booklore as he was, described the calling of the advocate as *ars lablativa*. Brougham told the law students of London University to habituate themselves to talk about everything.

For 'bare reading without practice pedantiseth a student, but never makes him a clever lawyer.' Our fathers understood this better perhaps than we do, and made provision in halls and cloisters and gardens, where students could take exercise and discuss the mysteries of their profession when the hours of reading were over.

Roger North tells us in his life of his brother, the Lord Keeper: 'I remember that, after the fire of the Temple, it was considered whether the old cloister walks should be rebuilt or rather improved into chambers; which latter had been for the benefit of the Middle Temple. But in regard it could not be done without the consent of the Inner house, the masters of the Middle house waited upon the then Mr Attorney Finch, to desire the concurrence of his society upon a proposition of some benefit to be thrown in on that side. But Mr Attorney would by no means give way to it, and reproved the Middle Templars very wittily and eloquently upon the subject of students walking in evenings there and putting cases, "which," he said, "was done in his time, as mean and low as the buildings were then, however it comes that such a benefit to students

is now made so little account of." And thereupon the cloisters, by the order and disposition of Sir Christopher Wren, were built as they now stand.'

The days of wandering in cloisters and gardens, putting cases to one's fellow-students, and listening to the wisdom of elders by the margin of the fountain are, alas! not for us. But even to-day a wise youngster should recognise that sitting in court to listen to the conduct of cases, attendance at circuit mess and dining in Hall, where the law-talk of seniors may still on occasion be of value—these things are all forms of industry, for the advocate can only learn the true creed of his faith from oral tradition.

In recent years we have wisely revived the old moots which date back to early days when the Inns of Court were really schools of law. Dugdale thus describes the ancient ceremony of the moot: 'The pleadings are first recited by the students, then the case heard and argued by the barristers; and lastly by the reader elect and benchers, who all three argue in English; but the pleadings are recited, and the case argued by the utter barristers, in law French. The moot being ended, all parties return to the cupboard, where the mootmen present the benchers with a cup of beer and a slice of bread.'

Roger North tells us that in his day, the time of Charles II., the custom of mooting had been discontinued for upwards of a century; but modern wisdom brings us back to many old customs of our fathers, and to-day all dramatic methods of education are recognised as of greater value than dictatorial lectures.

IV.

And not only are these more social forms of industry good in themselves, but they are the only antidote to that despondency and dread of failure that attacks the brightest and most helpful mind in the long days of apprenticeship. Even the greatest advocates have suffered such moments. Had John Scott yielded to his own sinking inclinations, he might have been a provincial barrister at Newcastle instead of Lord Chancellor; Kenyon nearly became a Welsh parson instead of Chief-Justice of England; and Russell tells us that in our own day Gully nearly exiled himself to the Straits Settlements, and Herschell proposed to emigrate to the Indian Bar.

A learned County Court judge, in dealing with the unfortunate bankruptcy of a brother-barrister, expressed the opinion that for a man to come to the Bar without private means, or, at least, expectations from a maiden aunt, was 'a rash and hazardous speculation.' His dictum was unsound in law and history. Some of the greatest advocates began life as poor men. And though men of wealth have succeeded in advocacy, yet poverty is a true friend to industry. 'Parts and poverty,' said Lord Chancellor Talbot, 'are the only things needed by the law student.'

Kenyon, when asked by a fashionable lady how her son might best prepare for success at the Bar, said: 'Let him spend all his money, marry a rich wife, spend all hers, and when he has got not a shilling in the world, let him attack the law.' For a lawyer, as an old pleader said, must be prepared in his early days 'to eat sawdust without butter,' or, as Lord Eldon put it, 'to live like a hermit and work like a horse.'

If a man is endowed with health and industry, the profession of an advocate is not 'a rash and hazardous speculation.' He may even without blame give hostages to fortune, remembering that when Erskine made his first appearance at the Bar his agitation nearly overcame him, and he was just about to sit down a failure when, he says, 'I thought I felt my little children tugging at my gown, and the idea roused me to an exertion of which I did not think myself capable.' He succeeded, indeed, far beyond his expectations, and he found, when he had overcome that first modest inertia which benumbs even the greatest genius, that he was fully equipped to fight the battles of his clients against all comers. And the reason of it was that he had not failed to read and learn and digest beneath the Lamp of Industry.

WHILE TRUTH PUTS ON ITS BOOTS.

PART II.

IV.

JELKS SOUND is a deep and irregular indentation in the land. To the eastern side the ground rises to the serrated razor-edge ridge which forms a landmark far out to sea; the western shore is muddy and flat, with undulating ground behind, covered with lush bush, intersected by creeks, alligator-haunted, malarial. Andrews concluded that the dead trader must have made his home on the eastern side of the Sound, probably somewhere near the mouth of the big river that empties its waters close to the head.

The schooner made good way, for the breeze was a stiff one now, but steady, keeping in one quarter with praiseworthy determination, and at the end of the second day's run Andrews was confident that they would make a landfall before the next night.

'I feel easier in my mind,' he confessed to the mate. 'The nigs will want time to get up their courage before they try again. If the girl's alive and safe, I aim to put her ashore at Port Moresby. The Hoopers will give her house-room until she can get the Sydney packet.'

'Right!' said the other. 'Virtue's got to be its own reward.'

They made the land towards evening on the following day, the blue ridge rising mistily out of the sea low down on the horizon, and steering a course which would bring them to westward of the head, ran into the mouth of the Sound before night fell.

They held a short consultation. Andrews was for keeping on until they got farther up the Sound; the mate advised caution.

'Bring her up here,' he said. 'There isn't anything going to happen to the girl during the night, and we can creep along to-morrow an' pick her up. The wind's falling, anyway.'

It was the latter fact that really decided the captain to remain where he was, for he was fidgeting about the girl ashore, and fearful as to her fate. Suppose the blacks plucked up courage again, and attacked the store from the land side! Suppose——

'I don't like waiting, and that's a fact,' he said uneasily. 'We don't want to find this station in ashes, and know that that girl's head's being smoked for the medicine-house. I should feel a hound!'

The mate pursed his lips. 'Well, I guess there isn't a puff to stir a cat's whiskers, cap. But if you're so almighty keen to get on, what's against our getting out a whale-boat, and snooping along the shore a bit to locate this station?'

'Good!' said Andrews. 'Now you're talking, my son. I'll go along with some of the men right away.'

'What about your good little mate?' said the latter, chuckling. 'Don't he come in on this racket—anyhow?'

'I thought you hadn't done running from the wimmin yet?'

The mate grinned. 'I'll have time for a get-away even if I do come along,' he said. 'Fact is, when it comes to a scrap I don't give two bits of paper for a crowd of Kanakas, like the tame lot we have aboard. Sailorising ain't scrapping!'

'Oh, we'll both go "heeled,"' said Andrews; 'though I hope we sha'n't need it.'

'Ah,' said the mate lovingly, 'I should be lonesome without my little lead squirt. When I talk with my enemies in the gate I do love to have something better than bits of stone to argue with.'

V.

So it was arranged then and there; the schooner's anchor went down, the whale-boat was drawn up on a shortened painter, and six lusty Kanakas tumbled into her, followed by the captain and the mate, who was arranging ammunition in his pockets with a kind of childish glee. The schooner's riding-light would serve for a mark on the way home, in case they did not come upon the shore station within a reasonable time.

The night was dark with a velvety blackness, few stars shone in the sky, and the moon had not yet risen. As the native crew rowed steadily up the Sound, keeping within a hundred yards of the shore on the eastern side, Andrews had his night-glasses continually to his eyes, sweeping the land for a sign of the trader's dwelling. Palms, pandanus, brush, endless trees, tiny bays, the mouths of one or two rocky streams, they passed, but there was no sign of the station. The air was very still; they could hear the swish of a bonito as it ran on the surface after a shoal of fleeing fish, the grunting occasionally of wild pig in the scrub ashore, the monotonous dull murmur of the frogs in the swamp on the western side.

Andrews put down his binoculars. 'I'm scared for that girl,' he said suddenly. 'Can't you imagine it? She's all alone there, in that house somewhere along, watching and waiting, afraid to sleep. Perhaps she hasn't been able to get out to fetch water. I shouldn't blame her, knowing those fellows were waiting round for a chance to spear her. A white girl, my son, and lonely! It's bad enough anywhere, but out here!'

The mate assented. 'Some of them would be loco over it. But I can't see we can do any more than we're doing.'

As he spoke the silence of the dark waters, the menacing but invisible land, was broken by a medley of voices, yells, shouts, screams, as if hell had vomited its furious denizens upon earth. The Kanakas in the boat stopped rowing, and listened fearfully.

'Get on!' roared Andrews in a voice that cut like a lash. 'Pull, you devils! Pull! My heavens! they've gone to it again!'

The mate caught his arm. 'It's close in here! Say, I don't hear that gun of hers. Suppose——'

'I daren't!' said Andrews, jumping in his seat with impatience, though the whale-boat was racing through the water at her best speed. 'Listen to it! Are we too late?'

He tugged at the rudder-lines, and the boat sheered in towards a little bay, backed by trees. Through the trees they could see a torch flicker and die out. The yells rose again maddeningly. At that fearful sound the Kanakas again stopped rowing, and one of them protested against going farther. Andrews pulled his revolver from his pocket and leapt at him. 'Get on you! You lib for die you no pull, you darned nigger! I kill that lot you fella you no go on plenty quick!'

The oars splashed again, and the whale-boat, racing into the bay, grounded on the beach. Andrews and the mate did not hesitate. They jumped for it the moment the bow grounded, splashed into shallow water, and without thought plunged into the bush.

To the black man the chivalry of the white will always be a source of mingled mirth and wonder. Andrews and the mate knew the dangers, they knew the fate that might await them if they failed, but they had heard that a

white girl was in danger there—at this moment, for all they knew, she might be engaged in a last desperate struggle for her life—and because of that they faced death without dismay.

Torches appeared again between the trees. One fell, and a great flame leapt up in the night.

'They're burning down the house!' Andrews shouted above the din. 'Come on, boy!'

As they ran into the glare made by the fire a spear whizzed past the mate's head, and stuck quivering in the trunk of a tree. The place seemed suddenly alive with natives, armed with clubs, spears, axes, and running, throwing, screaming like men possessed. Andrews threw up his arm and fired thrice. A spear pierced his sleeve; an axe thrown from behind a bush grazed his head. The mate was running hither and thither, firing and loading with marvellous rapidity.

As the axe touched him Andrews whirled round, and darted into the bush from which it had come. He came into collision with a hot bare body, felt a heavy hand on his throat, and fired. He fell with his man into the bush, rose again, his face scratched and bleeding, and staggered into the open. The glare had died down. He heard a rattle of shots from the right, and ran that way. He found the mate behind a tree bristling with thrown spears, cool, but sweating, shooting into the brown of a mass of natives.

They scattered into cover as Andrews's weapon came into play. The captain shouted to the mate as he fired, 'Where's the house? I thought it was on fire!'

'I don't know,' said the mate. 'Looks as if we'd bitten more'n we could—chew!' His words were punctuated with shots, and he 'broke' his weapon and pushed in fresh shells with energy.

Both could see now that the glare had been caused by a bunch of dry grass into which a torch had fallen. There was no house to be seen. The dark closed in upon them again, and only the hiss of passing spears hurled at random told of their enemies gathered near them.

'We must get her,' said the captain in a voice of anguish. 'I am going to bear to the right, old man. Do you turn left, and see if you can locate the station.'

They separated at once, and as they took their several ways there was a rush of feet, of men dashing forward, the thud of clubs on unguarded skulls, the screams of men impaled on stabbing spear-points. The natives had rushed the position, and were having a *mêlée* in the dark.

The mate turned to the left, chuckling, collided with a tree, and paused. He went on again, found himself puzzled by the wilderness of trees, stumbled over something, and fell. As he fell there was a rush. Then he was down under half-a-dozen men, suffocating, shouting, kicking, his fingers on one man's throat, his knee in another's chest, biting and scratching like a wild cat at bay.

Andrews had swung off to the right, but his feet betrayed him, and he came round in a half-circle. He drew up, with staring eyes and dry throat, as he heard the mate shout for help.

He went almost mad then. Screaming like a man bereft, he ran crazily to and fro, until he found himself within a few paces of a scrimmage on the ground, a whirl of thrusting, battling figures.

Then came the mate's voice, spent, but undaunted: 'One for old Oregon!'

A spear, standing point downwards where it had fallen, touched Andrews's foot. He grasped it by the haft, and felt suddenly cold. To stab at random into the struggling mass might be to kill his friend. Hastily he put his pistol in his pocket, felt for a match-box, fired the grass to his right, and sprang to the rescue.

The glare of the burning grass lighted up the spot, disclosed dark muscular bodies writhing, fighting over something beneath. With a cry Andrews stabbed down and down, shouting, his voice hoarse and cracked as he stabbed, 'Take that! That! Damn you all!—Hang on, dear old boy! I'm here.'

The mass fell away. One man darted to cover; two remained moving a little on the ground; the others lay grotesquely spread-eagled where the stabbing spear had caught them. Andrews fell on his knees beside the body of his mate.

'I'm here, old chap! Hi! You're all right. You know me. It's the captain, old scout—Andrews!'

The mate turned his face a little, and a faint grin overspread his white face. 'Some scrap, cap!' he said. 'Some——'

Andrews, crying with rage and despair, tore open the mate's coat, felt for the dead heart, and looked away towards the blazing grass, his face set. The cries, the shouts, the frenzied din of war had died down, and there was no sound in the night.

Half-an-hour passed, and he still crouched there, his hand upon the mate's heart. Then he suddenly straightened himself, put his arms about the limp body, and raising it, began to pass slowly towards the shore. The boat still waited; the trembling Kanakas had marvellously resisted an instinct to fly. They gave a cry of joy and relief as the captain staggered down to the beach, and walked up with his burden to the boat.

They rowed in silence to where the schooner's riding-light shone like a star. Andrews sat in the stern like a man of stone, and the blood from a head wound trickled unnoticed down his face.

VI.

The captain walked the deck of the schooner all that night, his shoulders bent, his gaze on

his feet. The mate was dead; the girl might be dead. He had failed to help her.

He had killed to no purpose, first the man he had picked up at sea, now these unreasoning savages. He had lost his mate, and his heart was heavy with the thought of the futility of it all.

The dawn came at last, and with it the serene light of the morning sun. The Sound was very peaceful, a calm, unwrinkled blue, and the sky overhead was unstained, unclouded, flawless.

Like a man in a dream, he gave the order to weigh, to get out boats to tow the schooner up the Sound. Like a man walking in his sleep, he paced the poop as the schooner crawled in, his glasses turned here and there upon the shores for sign of the station he had come so far to relieve. There were no signs, only the unending fringe of trees, and behind it the blue serrated ridge rising to the sky, the farther shore with its mud-banks, its flanking mangrove swamps. All day he searched, and the next; and then he turned the schooner's head to the sea, and went out under the impulse of a land-wind which had suddenly risen. They had nearly dropped the land when they spoke a small brig pointing south. At Andrews's signal she hove to, and Andrews went on board.

'A trading-station in the Sound?' said the grizzled skipper of the brig, shaking his head. 'Ain't bin one since the nigs wiped out Temple, ten years back. 'Tisn't safe. Place full of nigs allus fighting one another. No, you can take my word, there ain't bin white man, woman, or child on the Sound these ten years—and Temple had no belongings!'

The ships parted a quarter of an hour later. Andrews gave up the puzzle. Had he shot an innocent man when he executed (as he thought at the time) the native he had picked up at sea? Had he killed natives who were merely indulging in a tribal fight, lost his mate in a combat that was no concern of his? Impossible. There was the woman's story, circumstantial in details. It might be true that 'A Lie will run half-way round the World, while Truth is putting on its Boots'; but why, on the other hand, should the woman have lied to him at all? He was never able to answer the question. . . . .

What is a lie? If any one could have told him, most assuredly it was not the placid brown woman on Kule. In her simple mind there were no complex codes to regulate the use of the tongue. It was, if she thought about it at all, the woman's weapon of defence. She had been afraid that the lingering of the schooner in the river might awaken disturbing thoughts long dormant in her 'husband's' bosom. Obviously the schooner had to be sent away. What of it?

She came out on her veranda, settled herself in the shade with her betel and her thoughts. As she chewed she examined with loving care the dog-tooth necklet. No tiara of diamonds, no superb collar of pearls, could have given a society woman greater pleasure in possession than that coveted necklet. For such things on the islands men fought and died. She had coveted it from the first moment she had seen it on the neck of the wounded savage on the schooner.

She smiled subtly. What fools, those white people! Actually they believed everything they were told. Never would she understand how such simple people could prosper as they did!

And what extraordinary store they set upon those spectral, pallid women of theirs! One had only to tell them that one of their women was in danger to set them racing madly anywhere to the rescue.

She laughed quietly. Peace reigned again on the river, and a satiated alligator basked happily under the air-roots of a mangrove down the bank.

THE END.

GRAYLING AND SALMON FISHING IN LAPLAND.

AS long as it lasted the season had been a good one, eight and ten fish having been the order of the day for five weeks; but the snow-flood had given out, and the great Tana River (which drains a vast tract of wild country in Finland, Russia, and northern Norway, and which with its confluents is accessible to the migratory Salmonidæ for over four hundred miles) was dead-low; the appearance of its water was that of gin. The experiences of the day before had proved too much for my friends' patience, and at a council, held in an atmosphere composed of equal parts of mosquitoes and tobacco-smoke, it had been determined that after a few hours' rest they should take their departure for the mouth of the river, and go on an exploring expedition on the coast of Finmarken, while I remained on for another week to take my chance with the grayling. The preparations for the journey of nearly one hundred miles down-stream occupied a considerable length of time, but by 8 P.M. they were completed, and in a few minutes the three long canoes containing the travellers and their impedimenta had disappeared down the rapids.

Owing to the reduction in the number of its inhabitants, the hut—situated at the junction of the Levjok and the main river, where we had had our headquarters—looked rather deserted; but my Lapps, who had of late been depressed

at the want of fresh salmon, seemed in remarkably good spirits. Chattering like magpies, they sat round a fire brewing their eternal coffee; and one of them told me that within twenty-four hours we should have rain for a certainty, and lots of it. In view of the brilliancy of the weather and the height at which the aneroid stood, this forecast sounded too good to be true, but there was a modicum of encouragement in it nevertheless.

A little way below the mouth of the Levjok River there is a 'flat' on the Tana, some two hundred or three hundred yards in length, where grayling are plentiful, and this was chosen as our field of operations for the evening. It was shaded on both sides by pine-clad rocks; there was not a breath of wind, and the air was gray with mosquitoes. Wearing a veil, whose dimensions admitted of smoking inside it, and long gauntleted gloves, it was possible for me to stand the attacks of these venomous little insects and to fish in comparative comfort.

The Lapp in the bow controlled the movements of our light craft with his long birch pole, moving it from place to place, or holding it against the gentle current in one spot; his companion's time was fully occupied in using the landing-net and unhooking the fish, which rose greedily to the fly. Often I had two on at a time, and once Mikkel succeeded in scooping out three together—one on each fly. Fresh fish being wanted, I kept on until half-past eleven, by which time, although the sun was still above the horizon, it had become rather dark and distinctly chilly. I had secured between ninety and one hundred pounds of grayling; but, as it turned out, the sport was not yet over. While I was playing a fish of about a couple of pounds, which had taken one of the droppers, a salmon seized the tail fly—a Scottish loch pattern—and promptly we were engaged in a big fight. At first my friend seemed inclined to remain in the 'flat,' which he exploited in all directions for some ten minutes; but gradually he dropped back to the lip of the effluent rapid, down which we had ultimately to follow him—a dangerous performance in the bad light. The Lapps, however, managed with great skill to avoid the numerous obstacles, and some four hundred yards below they manœuvred the canoe into a comparatively sheltered bit of water among the rocks on the Russian side of the river, where Mikkel shortly afterwards gaffed out the salmon —a 24-pounder.

On getting back to the hut about one o'clock I found that the aneroid had, for the first time in a month, fallen very considerably; clouds were showing away to the south, and the Lapps were unanimous in prophesying a flood. How best to utilise the coming rain was the question. It was now the end of July, and previous experience had taught me that about that time, given a sufficiency of water, a run of heavy salmon entered the Tana, and ascended it as far as the group of magnificent pools immediately below the mouth of the Russian tributary, the Vietsjok, about thirty miles down-stream. Accordingly I arranged to make for the other (Scottish built!) hut, from which these could be conveniently fished, and about twelve hours later we got away in the middle of a regular and most welcome downpour.

After a somewhat sensational descent of the five-mile tract of rapids above Sjumpo, we reached the house of the Russian Kron-Feged at Aimijok in safety, but very wet. On the way I had tried the great pool Aite Gnoika Savo, which it takes hours to fish properly, and one or two others, but without success. On going down to the water's edge next morning soon after two o'clock we found the Tana had risen quite a foot; so, sending on my Norwegian *tolk* with one canoe and the heavy luggage, I started to fish my way down to the second hut, a distance of between six and seven miles. In Aimijok Savo I lost a heavy fish after playing it for some time; it cut the treble gut on a ledge of rock, and carried off the fly—a Durham Ranger. As we passed the mouth of the important tributary, which here joins the main river on the Russian side, the sun began to show through the driving rainclouds; and as the water had acquired a distinctly brown tinge, the prospects for sport had greatly improved.

As the Lapps turned the canoe against the strong current at the head of the Utsjok Gnoika two large fish threw themselves on the Norwegian side, and a third down near the tail of the pool. But these were evidently individuals which had been in fresh water for some time, and which the rain-flood had galvanised into activity. I caught one of them after a severe run—a 29-pounder —as also three others averaging twenty-three pounds on the way down, all slightly discoloured; but not until the next day, in the splendid pool Ula Savo, which the hut overlooks, did I fall in with any absolutely fresh-run fish —with sea-lice on their silvery coats. After that I had no reason to regret having elected to remain behind for a week's grayling-fishing; for when the day for departure came I found that in the week since my friends left I had added eight hundred and forty pounds of salmon to the season's bag, including a 40-pounder from my favourite pool, Biavra Savo.

On reaching Guldholmen, at the mouth of the river, we found that for some reason or another the Vadsö steamer was twelve hours late. After paying the Lapps their wages for the season, therefore, and squaring up generally, I went for a little cruise in the fjord with the Norwegian forest-master, who had come down with us from the Stor Foss. The water was, of course, brackish and very thick, but with Devonshire minnows we filled a large creel with beautiful sea-trout of from one to four pounds apiece.

DOMINA VICTRIX.

By Lloyd Williams.

I.

THERE was the swishing sound of a scythe outside, and Domina opened her casement window early to breathe the sweet air. For years past she had been tramping daily from her flat in Bloomsbury to the showroom in Conduit Street without a real holiday, and she intended to make the most of these few days.

She was not yet thirty, and she had conquered her world. Beginning with little capital, she had fought her way from a bare living to competence, and from competence to something like wealth and fame.

'Domina' millinery was in a class by itself. Women who knew the difference between the superbly good and the merely smart would point out a 'Domina' hat without hesitation; and she had won her success, not by good luck, as rivals sneeringly suggested, but by almost fierce endeavour.

As she looked from the window of old Mr Terriss's house her mind went back to those early struggles. Rex and she had parted company, after three years of married life, on the bottom note of failure. She loathed failure. She loathed the people who muddled through life on the brink of calamity, and she felt that Rex was the one man in the world whom she should not have married.

Domina valued money less than her enemies supposed. To 'build' a hat which sold for fifteen guineas although the actual material was barely worth thirty shillings was an achievement that delighted her, not on account of the money, but because there was hardly another woman in London whose work would fetch the same price. Rex excelled in nothing. The small legal practice inherited from his father dribbled away before her eyes; he could never seriously bend his mind to the work. Sordid vexations connected with rates and rent had doubtless helped to bring about the severance, for it is hard for a woman to respect a man who fails. And there had been no wrench at parting; he submitted to her wish with quiet acquiescence. Doubtless, he felt it was inevitable.

And she had succeeded.

Leaning on the window-sill and looking over a beautiful garden, she could review the past few years with satisfaction. There had been times when she nearly starved. In the days when she had no showroom, she carried out her own hats and called upon strangers, asking them if they would care to see some millinery. She had been snubbed and treated as something midway between a thief and a beggar.

Yet she had succeeded. Perseverance and talent had carried her through all troubles. One of her first triumphs was making a friend of old Abraham Terriss. He was an elderly widower, and she happened to call at his house to sell hats. Naturally he was finely amused, but he made her tell the story of her struggles, and before she left he had offered her the use of an empty shop.

'Suppose I couldn't pay the rent?' she said.

'You will. I shall charge you nothing for the first six months, five pounds the second, ten pounds the third, and so on till you are paying the correct figure, one hundred a year,' he said. 'Will you take it?'

It was an absurd little shop in the wrong part of the Edgware Road, and she could smile at it now; but she laid there the foundations of fortune. Her Conduit Street showroom cost her a thousand a year; she had a two hundred guinea Persian carpet on the floor, and the silk brocade curtains cost nearly as much. Her showroom girls were chosen with twice the care that girls are chosen for Daly's; face, form, manners, intelligence were all considered, and they earned salaries that a Second Division clerk might envy; there were dozens of women who shopped at Domina's for the sheer delight of being waited upon by the most beautiful girls to be seen in London.

Domina revelled in the profusion of her arrangements. The uniformed man who stood at her door had been the tallest man in the Guards, and stood rather more than six feet six; she paid him eight pounds a week, and considered him cheap at the price.

Mr Terriss, who had followed her rising fortunes with amused comments, was alarmed at some of these extravagances, but Domina was right. The more she spent, the more she earned. Besides, she was rapidly becoming one of the institutions of fashionable life. Americans visiting the Metropolis were told that they must certainly go to Domina's; they went—and Domina saw to it that they paid for the privilege.

And now she was taking a holiday—the first real holiday since she began. There had been wild rushes to Paris in pursuit of ideas, and occasional flights to Brighton and similar hurly-burlies, when health demanded it; but she had never before shaken the dust of the showroom off her feet and emptied her brain in order to fill her lungs.

She drew in a deep breath.

Still a young woman—hardly more than a girl, in fact—and she had succeeded. She had parted with the man who would have dragged her into sordid drudgery, and had made a life of luxury for herself.

In the garden below a man with a scythe was working slowly and rhythmically, and she looked at his bent back with a frown. The man with a scythe—old Father Time—would have her in the end. She was young now, but the years would pass; she would be a lonely woman, patronised by those who considered themselves her superiors, and envied by the unlucky ones. And she would have no one to share her success. No one to cry, 'Brava, Domina!'

She was a married woman with no husband—a single woman who could never marry. After all, that was a drop of bitterness in the cup, though she had been too busy to think of it before. She knew now that the chaffing applause of old Terriss was precious to her simply because he was human and companionable.

None of her friends and acquaintances knew that she was married; she was a spinster to all and sundry, including Mr Terriss himself, and her Christian name, Domina, had become almost a title of honour.

So she stared at the bent back of the gardener as he swung to and fro with his scythe, and a creepy sense of loneliness came over her.

Suddenly the man below unbent his back, in the slow, painful way of men who spend many hours stooping, and straightened himself; he turned round, and she saw his face.

Instantly all thought of herself vanished.

The man below was—Rex.

Her own husband, the man she had not seen or heard of for eight years, was cutting her host's lawn.

She drew back into the shadow of the curtains and stared. Her lips curled with contempt. So this was what he had come to. But could one be surprised? The man of education, who had taken a first-class at Oxford, and, if he had applied himself with reasonable industry, might have made a name and fortune in his profession, had sunk to the level of a gardener.

She observed his appearance with a woman's eye for detail—the heavy, shapeless boots; the trousers tied with a strap below the knee; the cotton shirt, open at the throat and revealing an expanse of brawny neck burnt almost black.

'My husband!'

She could not take her eyes from him, and when he bent again to his work in the slow, methodical way of his kind, she again drew nearer to the window.

'I suppose I was in love with him once,' she said to herself.

It sounded ludicrous; yet it was true. In the early days of married life she would have been indignant if any one had hinted she did not love her husband. They were equals and mates, and she could recall numbers of happy hours. Their honeymoon had been a dream of delight, and it was not till long afterwards that they began to drift apart.

Rex was an easy man to get on with, and perhaps that was why she first began to despise him. Her wish was law. Yet he was not a weak man. She remembered times when she could not stir him from his opinion or alter his course, and if it had not been for his persistent failure, her scorn might not have risen to fever-heat. They might have drifted through life just as happily as another couple. But now he was mowing the lawn, and she was the guest of honour.

II.

Mr Terriss received his guest, when she went down to breakfast, with a mock, half-playful obeisance.

'*Ave, Domina Victrix!*'

He had dubbed her 'Domina Victrix' years ago, when she 'stepped out' from a second-rate shop to a more spacious place, but she could never make sure that he was not making game of her.

'Our Sussex air is already bringing back the roses,' he said gallantly. 'Have you had a before-breakfast walk?'

'No. I have been studying your gardener,' she said quietly.

'How like a woman!' said the old man. 'You study the gardener, when you should have been studying the garden. I am positive that Mother Eve did the same. I wonder if you would be so good as to preside over the coffee-pot?'

'What does a man of that sort earn?' she asked.

'Here we have Mother Eve again,' murmured Mr Terriss, apparently addressing the chafing dish. 'We don't want to know what the man's outlook is, or what is the preoccupation of his immortal soul. We ask, what does he earn?'

'I'm afraid I'm a worldly creature,' said Domina with a smile.

'That's inevitable,' said her host. 'A girl who makes such delightful hats, and knows so well how to charge for them, could not be otherwise. Let us return to our gardener. I pay him four pounds a week, and consider it a good bargain.'

Domina's lips curled a little. She paid her showroom girls—the dainty, exquisite creatures who displayed her millinery so entrancingly—more than that, and would consider an hour's work of her own hands poorly rewarded if it produced less than a ten-pound note.

Mr Terriss was attacking mushrooms and bacon lustily. 'For the rest, he lives in a cottage along the lane, which you may see with your own eyes when we use the car. It has two rooms and a decent strip of garden; likewise a small glass-house. Even that is not all. He is a man of cultivation, and sometimes he and I have a talk on books and the like in such

a rarefied atmosphere that I doubt if Domina, victrix though she be, could follow us.'

'I suppose he has come down in the world,' she said coldly.

'That is what Bond Street says,' he remarked. 'The man happens to be a genius. In the eyes of Bond Street, all geniuses go down in the world.'

Domina frowned and helped herself to a pear. It was never easy to tell when Abraham Terriss was chaffing or talking seriously. What he said about Rex was characteristic; he was a man who would neglect his proper work, whether it were law or horticulture, in favour of dreaming fond dreams that were non-productive. Her practical nature had little sympathy with that sort of thing; yet she decided to seize an opportunity of speaking to him, and when Mr Terriss took his pile of letters to the library, she wandered into the garden to interview her husband.

He was still at work upon the lawn, and his back was turned to her as she approached.

'Good-morning!'

He unbent slowly and turned round, lifting his cap automatically. Then he stared in surprise.

'Domina!'

'So you have not forgotten me?'

'Hardly.'

His face was burnt almost black with constant exposure, and it was lean; his eyes were bright and humorous, and he smiled at her in the friendliest way.

'I didn't know you were coming here,' he said. 'The change will do you good. What do you think of my lawn?'

Now Domina knew as much as any woman in London about hats, but of lawns she knew nothing. You played tennis on lawns, and they made a perfect carpet for showing off a smart frock and a pretty hat; a hat designed for Goodwood, for instance, would be different from that she would design for Cowes. But as for the lawn itself—Domina smiled.

'It looks very green and nice,' she said encouragingly. 'I dare say you are proud of it.'

'The colour is good,' he said gravely. 'Considering it was laid only three years ago, I like the colour. But it's too young to be a good lawn.'

She looked at it again, and pressed her small foot upon its close, springy substance.

'In a couple of hundred years' time, if it is well cared for, and the successive gardeners are not too free with their infernal mowing-machines, it will be as good as the lawns at Oxford.'

Domina looked at the man in despair. This was like him. He was working on a lawn which would reach perfection when he was dead and buried and forgotten. Was it to be expected that a sensible, practical woman would spend her life in semi-starvation by such a man's side?

Hats for Domina every time.

'I'm afraid we have drifted far apart, Rex,' she said.

His face became grave. 'I fear we have,' he said. 'They tell me the dresses you design——'

'Hats, Rex,' she said demurely.

'I beg pardon,' he murmured, in the tone of a man who did not know that the two arts were entirely different. 'At any rate, you are a great success.'

'I have been lucky,' she replied, prodding his sacred grass with the end of her parasol.

He watched the operation for a moment, and then, quietly but firmly, put his hand over hers, and transferred the parasol to the gravel path, where it could do little harm.

'Sorry,' she said with a good-humoured smile. 'I forgot about the lawn.' Then, after a pause, she added something else: 'Mr Terriss doesn't know you are my husband.'

She was not a snob—not as the world counts snobbishness—yet it was embarrassing to find one's self a guest in a perfectly appointed and luxurious country-house, whose owner mixed on free terms of intimacy with the leading people of the county, and discover in the gardener your own husband. A less ambitious girl than Domina might have felt vexed.

'It's awkward, isn't it?' she murmured.

He laughed in quite the old, careless way. 'I didn't think of that,' he chuckled. 'We must be wary, Domina, and not let any one guess our guilty secret. At this moment Mr Terriss is coming from the house. I am the gardener, and you the lady visitor.—Excuse me, ma'am.'

He bent over his work, and Domina, having to choose in a hurry, accepted her rôle. Yet she was not to escape the penalty of pride.

'Cut Miss Hobson one of the new roses, Hobson,' said Mr Terriss. 'By the way, Hobson's name is the same as yours, Domina,' he added, as the gardener crossed the lawn.

'I'm afraid it's a common name,' she responded.

Rex returned with a delicious half-blown bud, crimson in colour, yet so dark as to be almost black.

'We are showing it at Shalford to-morrow,' said the old gentleman. 'And I fancy Hobson thinks he will win a prize with it.'

She accepted the blossom, and Rex touched his hat civilly. Domina felt extremely uneasy.

III.

First Prize and the Society's Gold Medal.
'Domina Victrix'—Mr Rex Hobson.

Domina was fond of flowers, but she did not enjoy the flower-show. It took place in the town-hall of Shalford, which was as unbeautiful as a town-hall could very well be; moreover, it was overcrowded by an extremely active and vigorous country population, who positively

gloated over flowers, fruit, and vegetables—particularly the fruit and the vegetables.

Mr Terriss had motored her over and pointed out Rex's success. It did not excite great enthusiasm in her breast. Winning a prize at a rose-show, in her estimation, was not at all the same thing as knowing that the half-dozen most stylish hats worn at the Royal Garden-Party were 'built' by Domina.

Yet, as the afternoon wore on, she had cause to alter her point of view. The Duchess of Shalford was present, because Shalford could not have found enough impudence to hold a flower-show without the Duchess's patronage, and her Grace had a way of making a casual remark as if it were a dictum of fate, and ought to be heard by the world at large.

'Who did you say the woman was?' she remarked distinctly.

There was a hasty murmur from one of her satellites.

'I have heard of her,' said the great lady. 'She makes hats. Or is it stockings? People of that sort don't interest me.'

Domina bore it with remarkable composure, though she was aware that half-a-dozen eyes were quizzing her. It looked as if a person might be a notability in Bond Street and obscure in the country. Later she had an opportunity of seeing the reverse of the picture.

Rex appeared at the flower-show, arrayed in a plain serge suit, looking, of course, the well-bred creature that he was, but self-effacing and shy as ever.

But Rex was somebody of consequence here. Every one knew him, and he was received with a hum of admiration such as Domina herself might have excited in the foyer of Daly's.

'That's Mr Hobson who grew the new rose, you know.'

These absurd people seemed to think that growing a new rose was as important as trimming a new hat.

Domina was nettled, especially when Mr Terriss took Rex to the duchess and introduced him as a person of the highest consequence. And the duchess commanded an Under-Secretary of State to make himself scarce, so that Rex might sit by her side and discuss the new rose. When the duke arrived, he positively hobnobbed with Rex; there was no other word for it. His Grace was a dull, quiet man, who was bored to death with being a duke; the joy of his life was to talk with a man who knew his job and could tell him things. Rex and he wandered about the town-hall side by side, examining flowers and fruit curiously, while a well-dressed crowd listened and stared in respectful silence. Presently they drifted close to Domina, and she heard a word or two of the discussion. They were examining a prize cauliflower, and the conversation was taking a learned turn. The wretched vegetable had a history. The duke thought it came to England in the seventeenth century, and Rex corrected him; it was the sixteenth century, and it came from Holland. He explained how the 'flower' had been artificially developed, and that it was a resplendent son of the humble cabbage.

Domina was downright irritated. All she knew about cauliflowers was that, with sauce, they went well with roast-mutton, and this serious disquisition on an obscure subject exasperated her. It exasperated her still more when Rex passed her without even a smile of recognition. No doubt he took it for granted that she did not wish to be hailed as an acquaintance, and, considered properly, it was the highest form of politeness.

At dinner that evening Mr Terriss was in high spirits, and took no notice of the fact that his guest was depressed and silent.

'Your husband is coming round to see me after dinner,' he said casually. 'I hope you'll excuse us if we shut ourselves up in the library.'

'My husband?' Domina gathered up her forces. 'I suppose he has been talking about me behind my back,' she said.

'My dear child, he has never mentioned you,' said the old gentleman carelessly. 'Try one of these Persian cigarettes. They are just your mark.'

IV.

Domina was not the woman to be silent; as soon as they were seated in the drawing-room she opened fire. 'How did you know he was my husband, if he didn't tell you?' she inquired.

'Guessed,' remarked the old gentleman laconically.

'But you couldn't guess when you had every reason to believe I was a single woman,' said Domina argumentatively. 'I think you might explain. I hate mysteries.'

'So do I,' he said dryly. 'But I am not mysterious. You and your husband are the mysterious beings. You mustn't blame me. Surely you knew that the man you deserted'—Domina frowned at the expression—'is one of those people who never discuss themselves or their belongings. Soon after he settled here I took the liberty of entering his cottage when he was absent, and I saw sufficient evidence to make me know he was the husband of my young friend Domina Victrix. That is all. He will be here soon. I suppose you wouldn't care to meet him in a friendly way?'

'No, thank you.'

'I thought not, Domina. You are an example of the clever woman who is a fool, my dear. You are mistaking the shadow for the bone.'

'I think not,' she said quietly. 'The truth is exactly the opposite. I have abandoned the shadow of happiness for the bone of reality.'

He looked at her quizzically.

'I am too old to try to convince a woman against her will,' he said. 'Yet there are one or two things I want to say. You think your husband is a failure and yourself a success. The truth is exactly the opposite. Domina Victrix is the failure; the humble gardener is the success.'

She laughed softly.

'No, no, don't reply to me,' he said gently. 'Let me do all the talking for once. Domina Victrix imagines that because she trims very admirable hats for which the world pays her a preposterous price she is a success. Domina is wrong. She knows in her heart that money is not the true measure of success. In a few months her most charming hats will be in the dustbin.'

'And my husband's rose will wither in as many hours,' she said smartly.

He laughed.

'That is true. But roses born of his mother-stem will be blooming hundreds of years hence. Domina, you have never done the fellow justice. Even from a material point of view, you don't value him aright. The duke offered him a thousand a year to take sole charge of the gardens at The Towers. He refused.'

'And you ask me to appreciate a man who is content with four pounds a week when he might earn twenty?'

'He refused because he is a great man,' said the old fellow solemnly. 'He prefers to work here for a small wage and cultivate the peculiar gifts God gave him. And they are greater gifts than trimming hats, my dear. He and I have sent to the press a book he has written, which will be read when you and I, and your hats, are dust. It is the most learned and complete history of the rose that has been penned. Men will treasure it when much of our civilisation has perished. It will be in every library in the world; it will be translated into every tongue spoken by men who love beautiful things. And you dare to think that because you can twist some feathers and ribbons into a becoming shape, you are entitled to look down upon such a man?'

She looked rather angry, for she was not used to such lecturing as this.

'Oh, my dear, don't think I don't appreciate your great talents, and your still greater courage,' he said. 'But you are missing the great things of life. You are missing the roses and treasuring the artificial flowers. If I had been younger, Domina, and you were free, I should have tried my hand long ago at winning you. But that can't be, and I want to see you crowned with roses instead of ospreys. You know the sort of crown I mean?'

'I believe I can guess,' she said in a low voice.

'When my wife was living——'

He was interrupted by a maid-servant. 'Mr Hobson to see you, sir.'

'Take him to the library, and ask him to wait a minute.' He returned to Domina and stood over her, looking down thoughtfully. 'When my wife was living, our happiness was spoilt by just that—the lack of children,' he said under his breath. 'We began life with little, and, as you know, we prospered. But nothing made up for that. She went to her grave long before her time, pursued by'—he hesitated, trying to find the word he wanted—'pursued by a shadow that made us both unhappy,' he went on. 'No one ever knew it, but it arose from the bitterness of disappointment and empty arms. She died, and left me a lonely old man, with nothing better to do than watch young fools make a muddle of their lives.'

He went to the door with his old jaunty, playful air. 'Don't let your arms be empty, Domina. Fill them with roses. Be a real victrix. Conquer that little core in your own heart that is spoiling all. Will you come with me now, and meet him as a friend?'

She refused.

V.

The cottage stood a little way back from the road, and was pleasantly sheltered by a tree or two; originally it was merely a workman's cottage, but now it revealed the personality of its inhabitant's spirit, and blossomed like a bower. A creeper had flung its arms round uncouth walls, and blossoms tapped at tiny windows.

The night was dark, and Domina had found her way along the lane with difficulty. Rex was still with her host; she had come here, drawn by a queer reason that a mere man could not well understand.

The old man had spoken weightily, and she was not the kind of fool who does not listen to reason. One thing he had said weighed with her more than all else, yet it was a phrase to which he attached little importance. In the aftertide of eloquence it was forgotten.

'I took the liberty of entering his cottage when he was absent, and I saw sufficient evidence to make me know he was the husband of my young friend Domina Victrix.'

What had he seen?

The question had drawn her out into the night.

What had he seen in Rex's cottage to make him sure he was her husband?

She hesitated before the door, and peered right and left into the darkness; then she put her hand on the simple latch, and entered.

It was a labourer's abode, yet the home of a fine spirit. One stepped across the threshold into the single living-room; the floor was of

red brick, and the space narrow; in the centre was a small deal table, and a kind of cupboard stood against the wall, where, doubtless, he kept the utensils of daily life. Obviously this room was at once kitchen and parlour; an old-fashioned stove held a slumbering fire, and on the shelf above was the photograph, in a silver frame, of him and her. She remembered it well; it was taken in Torquay on their honeymoon.

There were no other pictures in the room, for the walls were literally lined with books. He had converted his domain into a library, and she looked at the portrait of herself—and him—with a faint smile. In the days of their honeymoon hopes ran high; not till afterwards were they defeated.

'I suppose this made Mr Terriss guess us to be husband and wife,' she thought to herself. 'Still, it was a long shot. I should have thought there was something more significant.'

The cottage contained but one other room, and she hesitated at the door before entering. His bed, a plain, wooden affair, stood in the corner, and the place was bare with a Spartan plainness, except that books had overflowed from the parlour.

Here again there was but one picture, and that once more a photograph. Before it stood a bud of the new rose 'Domina Victrix' in a vase. She had lighted a candle which stood on the table in the parlour, and she crossed the room and held it up, so that she might see his one other work of art.

There she stood transfixed.

She understood now why the old man was so sure she was married. Again it was a portrait of herself—herself with a child in her arms. The son that was born to them in the second year of their married life had slipped out of the world when but a few weeks old. Rex photographed her with the little creature in her arms, and in the agony of her loss she could never bear to see the picture. Indeed, she had forgotten it.

And suddenly she knew that the woman she saw in the picture was the woman she no longer was, but wished to be.

The candle fell from her hand and sputtered out; she returned to the parlour and extinguished the light, for she could not bear to be seen. Beside the slumbering fire she seated herself and—waited for him.

Presently she heard his step. On the threshold he paused for an instant, startled, doubtless, because he had left a light burning, and found the place in darkness. Then she saw him silhouetted darkly against the night as he stood framed in the doorway.

He came to her side and laid a hand on her shoulder. 'Have you come back, Domina?' he asked gravely.

'If you want me,' she whispered, weeping softly. 'But if you don't care——'

He laughed, and, kneeling down, drew her hands from her face and peered into her eyes by the firelight.

Suddenly she started. 'What was that, Rex?' she said under her breath. 'I felt'—she looked round among the shadows in awe—'I thought I felt a tiny hand on my cheek.'

'I have felt a tiny hand clutching at my heart for years, my dear,' he said. 'But you will never find the spirit of childhood where you have worked, Domina. We will seek it together among the roses, for my lady has stooped to victory at last—victory, indeed.'

BUTTERFLY TOWN.

ANY bright day on the heathy down
You may hear the music of Butterfly Town.
'Tis not very loud, and not very strong,
Just a murmurous hum, but an old, old song,
Older than you or I or dad,
Older than grandfather when a lad;
To the Roman who wandered long ago
In this same corner it still was so.

There 's no great show in this fairy town,
For 'tis only a patch of the thistle-down,
With else a nettle and dock or two,
And a long-stalked scabious bold and blue.
'Tis he that plays the commissionaire
To warn you off with a frigid stare;
And if you stand still and don't take fright,
He 'll go on nodding with all his might.

Tortoise-shells, peacocks, and admirals too,
With just the appropriate touch of blue!
That is their club, that old brick wall,
Where the warm resilient sunbeams fall.
They don't seem bothering much to-day
With the income-tax or the price of hay,
And yet they are very busy too,
As people are who have nought to do.

The song they sing only they can hear—
Unless you 've a sympathetic ear—
For even the wild bee's underdrone
Roars like a thunder above their own;
And the breeze that sighs in the alder copse,
And bows all together the nettle-tops,
Carries away with the thistle-down
Those elfin strains of Butterfly Town.

For their song is as old as life itself,
Not sung for honour or fame or pelf:
It is only singing for singing's sake,
A safety-valve that the heart mayn't break.
When life is life to be lived alone,
Without any thoughts of how it 's done,
It just comes bubbling, but ne'er can drown
The gay, insouciant Butterfly Town.

KUTZMANN THE COURIER.

By SIDNEY T. FELSTEAD, Author of *German Spies at Bay*, *The Blood-Stained Pearl*, &c.

PART I.

I.

'*AH*,' growled Colonel Baron von Hauptmann of the German Secret Service, 'so you are ready to serve the Fatherland in any capacity—no?'

'They told me at the *Kriegsministerium* in Berlin that you were wanting couriers to carry messages to America,' replied the object of the Herr Colonel's somewhat contemptuously-put question. 'I am quite willing to do that. I have just come back from America, but they say I am not physically fit for military service in the field, and suggest that I could be better employed where my knowledge of the English language might be utilised.'

'What shall we do with him?' asked the colonel, turning to his colleague, Major Stolzberg, who was watching the pale, unpromising-looking Imperial messenger with amused indifference.

'Oh, I think I should send him to England first,' answered the major. 'We had better find out what he is made of before entrusting him with despatches to Bernstorff. Let him go over to London and make the acquaintance of Luise. She has much valuable information to give us, and finds herself unable to get it through owing to the accursed English censorship. Our young friend here can have an American passport. Nobody will suspect him. The English will never dream that the Fatherland is so short of agents that we send a player of the piano as a spy.'

'Good!' said the colonel. 'We will send him on to Rotterdam to-morrow.'

'But, pardon, Herr Colonel,' interjected the victim of these amiable passages, 'I do not think I should become a successful spy. The English would be certain to ask why I had come to their land. Besides, I do not know my way about the country.'

'What does it matter?' answered the colonel roughly. 'We will provide you with a passport issued in Washington, and will give you papers to show that you are a commercial traveller. Luise will collect the information. All you are wanted to do is to stay in London quietly, and, when Luise is ready, bring across to Rotterdam the messages she will write out for you. There is no risk whatever. We will give you a thousand marks a month, and will pay all your travelling and hotel expenses. Report yourself at ten o'clock to-morrow morning, and we will give you your instructions.'

It is quite possible the newly recruited agent would never have accepted the idea of going to England as a spy had he been a witness of the many similar scenes which had been enacted in the German-occupied *mairie* at Antwerp. More reluctant still would he have been had he known that during the past three months half-a-dozen German spies sent to England had mysteriously disappeared—where, none of their employers could tell, although Colonel Baron von Hauptmann and his cynical coadjutor had a very fair idea that the British knew. However, it was none of their business. Their particular mission in life at that time was to get spies into the country of their hated enemy, by hook or by crook. The cosmopolitan crowd of adventurers and *demi-mondaines* revolving around the master-spies in Amsterdam and Rotterdam had grown wary. Fellow-mercenaries who had gone to England, seemingly secure in the possession of forged passports and elaborate sets of false papers, had failed to return to the cafés frequented by the gentry who day by day compared notes as to the possibility of securing some immense secret which would sell for a sum likely to keep them in affluence for the remainder of their days. But trips to England, no! There seemed to be something wrong with the theory of the master-spies that the English were too stupid for words. Of all this, however, the newly enlisted spy, Emil Kutzmann, was quite ignorant. He had left Germany as a very young man, and had spent some years in the United States of America, returning to the Fatherland at the call of Kaiser and country. Always there remained in his consciousness the fact that the word of a Prussian officer was sacred.

Days of fear and trembling succeeded that interview at the Antwerp town-hall. From the Belgian seaport Kutzmann had made his way to Rotterdam, where he made the acquaintance of that interesting section of the German

 [*All Rights Reserved.*]

Secret Service which kept a first-class stock of fabricated passports. And also he met Herr Flores, who from being a schoolmaster had assumed the war-time rôle of mentor of amateur spies about to proceed to England. Flores was nothing if not plausible. 'Good!' he said with guttural pleasantry. 'It is good indeed to see our young Germans so eager in the service of the Fatherland. Serve us well, and you shall have the Iron Cross of the Third Class. Come back this afternoon, and we shall have everything ready for you.'

'Is there much danger, Herr Flores?' asked the spy, inwardly shaking at the expeditious manner in which his going was being arranged. 'Are the English not likely to suspect everybody foreign who enters their country just now?'

'Danger—poof!' replied Flores. 'Have we not our agents travelling to and fro almost every day? Do they not go to London and sell the stupid English goods which never come, and bring us back all sorts of news of what Kitchener's Army is doing? Do we not know where the British Fleet is hiding itself, thanks to those patriotic Germans who are still in England? And it is you, my young friend, who shall be the means of conveying all this wonderful information back to the Fatherland. You shall be the courier to carry the news that will enable our High Seas Fleet to drive the English rats from their lair. Our wonderful Luise in London knows all the English naval officers; she it is who will travel up to Scotland, there to gather the news that you must afterwards bring back to me. Just keep a still tongue in your head, and you will be in no danger whatever.'

Late that day Kutzmann was equipped with the stock-in-trade of a spy. A passport with his photograph newly emblazoned thereon, the forged signature of the American Secretary of State requesting that Mr George Davidson be given every facility to travel between America, Great Britain, and Holland for commercial purposes, seemed to provide an identity safe enough for the allegedly stupid English. Also had the spy been supplied with the address of the wonderful Luise, whom Flores declared to be a beautiful woman, especially fond of a brave man. Funds amounting to one hundred English pounds reposed in his breast-pocket, with a promise of as much more should occasion arise. Altogether, the prospects of the hitherto penurious Kutzmann seemed excellent. The only fly in the ointment was the English.

II.

Luise Schmidt—or Smith, for the convenience of war-time—was certainly a fascinating little woman. Necessarily so, owing to the fact that for twenty years she had lived on her charms. By virtue of this fact, coupled with the undoubted truth that she was growing *passée*, she had readily enough enrolled herself in the German Secret Service, which worked on the doctrine common in the Fatherland that to be successful a female spy must, first, be devoid of morals, and, secondly, be beautiful. Luise certainly fulfilled the first qualification.

But the arrival of Kutzmann did not give her unalloyed joy. '*Ach*,' she said, relapsing into the German tongue in the privacy of her lodgings in Bloomsbury, as she looked at the insignificant Kutzmann; 'it will not do for you to travel about the country. If they found you asking questions around their naval ports, they would know you were a spy immediately. Besides, you will not see anything. It is the officers who know.'

'Herr Flores said I was not to move about,' replied Kutzmann. 'He said I should stay in London, and was to take back to Rotterdam letters you would write.'

'Did he give you anything to write the letters with?' asked Luise.

'No,' was the reply. 'He told me to use the juice of a lemon and a clean steel pen, and be sure to have a rough-surface paper.'

'Bah!' said the woman contemptuously; 'that man Flores lives in the Middle Ages. Does he not think that the English learn? Writing in lemon-juice was known hundreds of years ago. I can give you a better ink than that. What it is I sha'n't tell you. If you are caught, you will not be able to tell them what it is, for you will not know. How much money have you?' she asked suddenly.

'Nearly one hundred pounds,' answered Kutzmann.

'Good!' was the reply. 'We will have a week's enjoyment in London, and then we will go down to the seaside for a few days. I have been running short lately owing to the trouble of getting money over Holland. These English trace every remittance that comes into the country. You have to be careful. Whatever you do, don't tell anybody your money comes from Holland. The West End of London is full of spies.'

Followed a week of riotous living. From his Bloomsbury hotel, where he led a so far unsuspected existence under the name of Davidson, Kutzmann daily escorted the expensive Luise to fashionable restaurants, where all kinds of dubious characters, remarkable only for the impeccability of their outward raiment, greeted her with voluble cheerfulness. Mr Davidson interested them not at all, except as a supposedly wealthy young man anxious to spend his money with all possible despatch.

It was not long before funds began to run short. The trip to the seaside, where the pair posed as casual acquaintances, made the remainder of the hundred pounds vanish altogether. Luise suggested that her cavalier should cable to Holland for more, and after some little demur Kutzmann consented, making the stipulation that the woman should begin her travels to the

north of England, where she could pick up something concerning the Grand Fleet with which it would be worth his while returning to Holland. And that, although neither Kutzmann nor the woman knew it, was the undoing of them.

III.

The head of the British contra-espionage service, despite the fact that the war was only in its second year, was sorely disappointed in the reputedly wonderful German spy system. It seemed that the Hun was never able to solve two or three basic problems connected with successful espionage. He could get his spies into England right enough, but he did not appear able to keep them supplied with money in a manner which would defy detection. Neither had he discovered any particularly efficient manner of enabling them to transmit their information—such as it was—to the desired office in Holland. Sweden had been tried; Norway had been tried. No better result had attended the establishment of dozens of little shops and offices in Amsterdam, Rotterdam, and The Hague. The British had a most regrettable habit of sending over to these places people who apparently spoke every language under the sun, men who made appallingly endless inquiries as to who lived at these mysterious addresses, and what they did for a living. And the almost inevitable consequence of these visits was that letters from England ceased to arrive when most wanted. And, worse still, communications in secret ink which did get through sometimes proved to be nothing but forgeries. It would appear that we were unscrupulous enough to capture the spies, and, with a consideration rare in these days, continue their correspondence for them.

However, human nature is proverbially optimistic, so Kutzmann got his remittance. Flores decided that he should have thirty pounds, and, to eliminate all suspicion, had it sent in the name of the Dutch firm which Kutzmann was ostensibly representing. A French bank in London was chosen as the medium; Flores thought that the fact of a Dutch house patronising an Allied bank would keep the inquisitive English from worrying as to who was to be the recipient of the thirty pounds.

Very unfortunately for all parties concerned, the British spy-hunters had come to learn many things in the few months the war had been in progress. One was that the German spies wrote messages in German between the lines of a letter in English, and that this message might be read by any one possessing the perspicacity to heat a flat-iron over a gas-ring, wipe the iron carefully, and then pass it over the letter.

And another thing we had learnt was that the German payment for spies in this country was thirty pounds a month! It was indeed unwise to receive such an amount at that particular period of the war.

Anyhow, as I have said before, 'Mr Davidson' duly received his thirty pounds. The West End branch of the French bank mentioned, all-oblivious of the origin of the money, paid 'Mr Davidson' in British Treasury notes; and that gentleman, living a quiet and fearful life in his Bloomsbury hotel, registered a mental vow that, whatever happened, the spendthrift Luise, then industriously gathering information in Scotland, should have none of this remittance.

It so happened that one of the regulations made for the defence of our realm was that all remittances coming from abroad should be revealed to the British authorities. 'Mr Davidson's' thirty pounds was among these, and in due course an officer was detached to find out who 'Mr Davidson' was, what he wanted here, and how he occupied his time.

Nothing happened. 'Mr Davidson' hung around his hotel practically all day, speaking to few, reading but little, and apparently waiting for something to turn up. The officer watching him put up at the hotel and spoke to him occasionally, but received nothing but disjointed replies. 'Mr Davidson' did not want his company; that was evident.

'I don't know what to make of him, sir,' was his report to the chief of the contra-espionage. 'He may be on a spying mission, but so far as I can find out he goes nowhere at all. He speaks with an American accent, and says he is over here to buy metal for Holland.'

'All right,' said the chief; 'don't let him out of your sight. I have arranged for his letters to be kept under surveillance. If he gets another thirty pounds, we shall know what to do with him.'

A week of unmolested residence at his hotel did much to restore the confidence of Kutzmann. Lounging about the place all day, he managed to strike up one or two acquaintanceships with English people in town for a few days. Quite a warm friendship sprang up between the pseudo-American and a Kentish family with a small place near the North Foreland, as a result of which 'Mr Davidson' was invited to spend a week-end there. Combining business with pleasure, Kutzmann took a walk into Ramsgate. He was volubly inquisitive towards the family, asked questions as to the war-vessels that visited the port, whether there had been any Zeppelin bombardments, what were the signals shown by the lighthouse, and many other things. In fact, his questioning became a little oppressive, and the family were forced to plead ignorance as an excuse for silence.

Kutzmann returned to town on Tuesday morning, and drove from London Bridge to his hotel in Bloomsbury, where he found a letter from Luise Schmidt, with the Edinburgh postmark to proclaim her whereabouts.

'I have only been able to obtain a little information of value,' she wrote. 'Important movements are taking place in the disposition of the Grand Fleet, and it is better for me to remain in Scotland for some time. There is a battle-cruiser squadron at Rosyth, together with many armed trawlers for mine-sweeping. I am trying to find out when and where the squadron is going. You had better write a letter to Rotterdam, using the ink I gave you before I left. They will develop it over there. Write an ordinary business letter to your firm in English, leaving enough space between the lines to send my information, together with any you have been able to pick up yourself. I shall be wanting more money soon; you had better mention that in your letter.'

IV.

Major Jameson of the British contra-espionage service came into the room of his chief with a smile of satisfaction on his face. He was carrying in his hand a letter, which on close examination the chief perceived to be covered with a mass of handwriting that at first seemed indistinguishable. Closer scrutiny, however, showed that the first line was written in English, the next in German, and so on all down the page. 'Who is the writer of this, Jameson?' asked the chief.

'Oh, it is that fellow at the Loch Lomond Hotel in Bloomsbury,' replied Jameson. 'You remember the one, chief, who got the thirty pounds about a week ago.'

'Oh, yes,' said the chief, reading the German message. 'So we have a battle-cruiser squadron at Rosyth, and a fleet of mine-sweepers there as well. And Ramsgate possesses a light which flashes twice a minute, does it? And Margate was severely damaged in the Zeppelin raid of a month ago, was it? And you want more money, do you, Mr Davidson? You all do.

'Well, Jameson, I think you had better go down to Scotland Yard for a couple of men. Then go to the hotel and inform Mr Davidson that some difficulty has cropped up with regard to his passport. You can have a short preliminary interrogation at the "Yard," and then, if he will not tell you anything, keep him under arrest until you are ready to have him properly examined. Who is the letter addressed to, by the way?'

'Oh, an old acquaintance,' answered the major. 'Our friend Griebe, to be precise.'

'Good gracious,' said the chief, 'why will they always use that man's address? It doesn't give their unfortunate spies a chance.'

Making his way to the 'Yard,' where his wants had been notified by telephone, Major Jameson picked up his two detectives and took a cab to Bloomsbury. 'Do you know if Mr Davidson is in?' he inquired of the girl at the hotel office.

Mr Davidson was in the smoke-room, it appeared, so the major went there, and, sure enough, found his man in an easy-chair, busy reading a morning paper. 'I should like a word with you, Mr Davidson,' said the major. 'Would you mind coming outside a moment?'

The spy jumped up with a sharp exclamation. 'What is it?' he asked agitatedly. 'Is there anything wrong?'

'I don't know,' was the reply. 'The authorities appear to think there is something the matter with the *visé* on your passport, and would like you to come down to Scotland Yard to answer a few questions.'

'Scotland Yard! Is that not the police headquarters?' asked Kutzmann, his face going white.

'Yes,' was the reply.

'But—er—I don't know——'

'You must come along at once,' said the major. 'I have a cab waiting.'

'And who are these gentlemen?' asked the spy, as the major ushered him into the vehicle.

'Oh, they are colleagues of mine,' said the major. 'You had better not say any more just now. Anything you have to tell can be kept until we get to Scotland Yard.'

(*Continued on page 204.*)

OLD FIRMS.

By W. A. Atkinson.

THE annals of the peerage tell us much of long associations of families with certain places. The continuity of the succession to domains and castles, and the long tenure of offices of dignity and trust, constitute a great part of the history of the aristocracy. One might almost say that these things are the plot and purpose of the aristocratic story, for, though the interest and the romance are almost entirely connected with the personal deeds and circumstances of the successive actors, the historic effectiveness of their lives is judged almost exclusively by their success or failure in maintaining the continuity of their holding, whatever the character of that holding may be.

While books innumerable have been written upon and around this subject, not much has been written of a subject which has a somewhat similar interest—that is, the long-continued association of a family with a particular trade or industry. The chief reason for this is, no doubt, that industry and trade have only in recent years

been regarded as worthy to be chronicled by the side of the military deeds and the sporting prowess which have adorned the lives of the ancient aristocracy. Even now, though we have all to acknowledge the necessity and the dignity of labour in the upholding of the body politic, there are many who will not accord to it the honour which they give to military skill and daring. Nor is there the material available for long industrial histories. Though the craft-names which many men bear point out to us how far back these personal associations with industry go, there are no genealogical records to bridge the gap between the remote past and the present, such as we can find for personal and territorial associations in almost every church and castle, and in thousands upon thousands of rolls of parchment. The records of our oldest firms go back only a century or two, while it is quite the usual thing for a person of aristocratic connection to trace a lineage back to post-Norman days, if not to the Conquest itself. A firm or partnership is, of course, a corporate entity, and not a personal one. It may, so far as continuity is concerned, be nothing better than a name. On the other hand, it may be an actual family succession, like the publishing house of John Murray, now presided over by the fourth in succession of that name and family. These are details for the serious historian of old firms to investigate; and though there are pitfalls for the casual writer, they are probably not greater or more numerous than those which lie in the path of the true genealogist.

Some years ago the writer was made aware that the name of Henzell was to be found in the list of glass-making firms in Newcastle. The fact was interesting in the light of a historical record, not carefully verified, that the manufacture of glass was commenced at Stourbridge in 1557 by Thomas and Balthazar Hennezel, and that other members of their family settled in Newcastle-on-Tyne. It seemed that here were circumstances favourable to the preservation of some tradition of a long family connection with an old industry; but, alas! investigation failed to reveal the slightest evidence of any such tradition.

Traditions of this kind are often worthy of investigation, however, since a notable historic incident frequently leads to the preservation of some record of the origin of an industry, or of its transference to a new locality, which would in all probability have been lost but for this association. At Salendine Nook, near Huddersfield, there are potteries still carried on by the descendants of a Scottish family named Morton, who fled from Scotland to escape a persecution of the Protestants about the time of the accession of Queen Elizabeth. They were potters, and settling at Salendine Nook, they established works, which were staffed partly by their fellow-countrymen and partly by workmen from Staffordshire.

Cast plate-glass was first made in England at Ravenhead, near St Helens, by a chartered company which established its works in 1773. The history of this company is interesting, as showing the way in which works, or at any rate their goodwill and traditions, often persist, though their original names disappear. The name of the initial company was the British Cast Plate-Glass Manufactory, and the writer possesses a tariff or price-list of this company dated 1794. Shortly after this the works were acquired by the British Plate-Glass Company, which carried them on to the middle of the nineteenth century, and exhibited specimens of their products in the International Exhibition of 1851. At this time the London and Manchester Plate-Glass Company, proprietors of works in the neighbourhood, acquired a lease of the Ravenhead works. This company continued the manufacture until 1896, when it went into liquidation, and a new British Plate-Glass Company took over the Ravenhead part of the concern, and carried it on until 1904, when the works were bought by Messrs Pilkington Brothers, a firm which originated about a century ago, and has grown to be perhaps the largest firm of its kind.

In this history we have no record of personal associations, such as we should look for in the history of a 'firm.' It is hard to say what it is which persists through all these changes, whether buildings, site, type of industry, commercial goodwill, or mere reputation and tradition; yet something does persist, perhaps a little of all these, and gives a sense of continuity.

We have examples of this sort of thing, ranging from the haziest ghost of an entity to a close family succession, in hundreds of businesses and industrial concerns. The earliest work issued from the Oxford University Press was a treatise on the Apostles' Creed, printed in 1478, a date which carries us back to the very dawn of printing in England. The issue of works has not, however, been continuous. There are large gaps in the first century of its history, but from 1585 the issues have been continuous, and from first to last over twenty thousand works have been produced. For a century or more the actual printing was done in the Clarendon Building, Oxford, built with the profits of Lord Clarendon's *History of the Rebellion*.

The Society for Promoting Christian Knowledge, founded in 1698, and the Religious Tract Society, established in 1799, have as printing and publishing agencies corporate associations more definitely personal than the Oxford Press, with its long history and its vague origin. From these it is but a step to a score of publishing firms which have had a dominating family or personal association for a century or more. Rivingtons, for instance, have been associated

with the publishing business for over two hundred years. In earlier days the firm published works by Dr Johnson, Richardson, Smollett, Pope, Gray, and Prior; and later they published the much-discussed *Tracts for the Times*.

Something analogous to the progressive steps towards family control exhibited in these printing and publishing concerns may be seen in other industries. We have an excellent example in the Kirkstall Forge, near Leeds. The earliest iron smelting and working was associated with Kirkstall Abbey, and according to some historians may date from the period of the founding of the abbey in 1152. The ore was the black-bed ironstone, obtained from bell-shaped pits, which were widened out at the bottom when the band of ore was reached. The traces of such pits have been found in the very heart of Leeds, a mile or two from the abbey, and old heaps of scoriæ are to be found in the vicinity of the present forge. The forges of the abbey were probably not worked by the monks later than the close of the fourteenth century, but other workers continued the industry, and it is said to have been ascertained that slitting-mills or rod-mills were set up over two hundred and fifty years ago. Finally, the modern forge has been in the family of the present owners, Messrs Butler, one hundred and forty years.

The history of the Royal Porcelain Works at Worcester reveals a family connection which the present name and constitution of the company would hardly lead us to suspect. The works were founded by Dr Wall in 1751, and the original partnership deed, naming fifteen proprietors, is still in existence. Dr Wall died in 1776, but the remaining partners carried on the works until 1783, when they sold them to their London agent, Mr Flight, who placed them under the management of his two sons. Ten years later Mr Barr joined the firm, and the Flight and Barr control continued under various designations until 1840.

Among those who were associated with Dr Wall when the factory was established was a Mr Chamberlain. When the works were sold in 1783, he severed his connection with the concern, and commenced business on his own account. The new venture was a success, and there was always a Chamberlain at the head, and in active control, of the business until 1840, when the two factories, the Barrs' and the Chamberlains', were united under a joint-stock company, on the directorate of which both families were represented. A Chamberlain continued at the head of affairs, in spite of one or two changes, until 1852, when the firm passed under the control of Kerr and Binns, which management lasted until the present company was constituted in 1862. The designation 'Royal' dates from 1788, when George III. visited the factory. This sketch-history of the proprietorship of the works reveals an actual family connection with the industry—that of the Chamberlains—lasting a century, and this, too, through a number of curious titular and partnership changes.

We may contrast with this the history of the firm of M. Oldroyd & Sons, woollen manufacturers, of Dewsbury. The business was founded in 1818 by the late Mr Mark Oldroyd, and the recent head of the firm was his son, Sir Mark Oldroyd. In this instance a whole century has been bridged by father and son, though the business was technically reconstructed in 1897, in order to cancel certain share liabilities. Sir Mark Oldroyd, who was born in 1843, was trained for the Congregational ministry, but his father's business grew so rapidly that it claimed his energies, in addition to those of his two elder brothers. He joined the firm in 1862, and when it was converted into a limited liability company in 1873, he became the managing director.

The history of Barclay's Brewery is interesting in several ways. The firm of Barclay, Perkins, and Company may be said to have been founded by Barclay, a Quaker, who paid one hundred and thirty-five thousand pounds for Thrale's Brewery, that concern which Dr Johnson described as offering a potentiality of wealth beyond the dreams of avarice. This was in 1781. The business, however, was already in existence in 1709, when Dr Johnson was born. It was then carried on by Edmond Halsey, upon whose death it was sold to his nephew, Ralph Thrale, for thirty thousand pounds. Part of the brewery occupies the site of the old Globe Theatre of Shakespeare's days. Whitbread's brewing business was contemporaneous with that of Thrale. Guinness's business in Dublin was started in 1759, the beverage brewed being not stout, but an 'Irish brown ale.' The brewery of Bass and Company was founded in 1777; and Allsopps absorbed a business which was in existence some fifty years earlier than this.

A little while ago there was sold in Yorkshire an estate in seventy-one lots, which estate had been in the possession of the vendor's family for three hundred years. An ownership going back roughly to the days of Shakespeare is interesting, but not really remarkable. Much more so is the fact that one of the lots was an inn, named the 'Cross Keys,' which had been in the occupation of one family, of the name of Lister, during the whole of the three centuries.

The firm of Broadwood & Sons is said to be the oldest firm of musical keyboard instrument makers in the world, and the business in England which has been longest carried on in the house in which it was originally started. It was founded in 1732 by Burkhardt Tschudi, a Swiss, who came to England in 1718. There is in existence a painting, by an unknown artist, which represents Tschudi tuning a harpsichord which he presented to Frederick the Great in

1744–45. His wife and two children are with him, and one of the latter, when grown-up, carried on the business in conjunction with his brother-in-law, John Broadwood. Frederick the Great bought two harpsichords from Tschudi in 1766 for his palace at Potsdam; and in 1773, just before Tschudi died, he bought two others, one of which he presented to Maria Theresa, and the other to the Empress Catharine of Russia. The number of harpsichords and pianofortes produced by this firm is enormous. Between 1780 and 1861 they manufactured over 123,000 instruments, the average for the latter part of the period being well over two thousand a year. They have introduced many important improvements in construction, and the firm's existence covers, in fact, practically the whole period of development of what is now the pianoforte. The factory, 33 Great Pulteney Street, bore in Tschudi's days the sign of the Plume of Feathers.

The firm of Godfrey & Cooke, chemists, had a long tenure of premises in Southampton Street, London, before they removed to Knightsbridge in 1863. Theirs was at that time the oldest chemist's shop in London. The predecessor of the firm was Hanckwitz, a Pole or a Russian, who first commenced the manufacture of phosphorus in England, under Boyle's direction, and sold it wholesale at fifty shillings an ounce, and retail at sixty shillings. This was in 1680, or, more correctly, it was to this date that Hanckwitz referred the commencement of his business in the neighbourhood of Southampton Street. The said street was commenced in 1704, and in it Hanckwitz built new premises in 1706, into which he removed. He died in 1741, and was succeeded by Ambrose Godfrey. Messrs Godfrey & Cooke retained the date 1680 on their premises in Southampton Street, thereby, perhaps, unwittingly suggesting a misapplication of the date; but the tenure of the premises, all deductions made, was a phenomenally long one.

The financial value of an old name in business is hardly to be measured. An old name is an advertisement of the best kind, for it implies a firm which has been manufacturing goods for a long period, and the persistence—which is perhaps only another name for the excellence—of these goods has been recommending them all the time, as a mere literary advertisement hardly could. Let us try to imagine, for instance, what the name Rodgers means to the buyer of cutlery. The firm of Joseph Rodgers & Son was established about two hundred years ago. It possesses a set of samples made in 1735. Throughout the long period which has intervened, it has built up and maintained a reputation for honest workmanship in an industry and a place where the standard of workmanship is very high. It is related that many years ago a son of one of the members of this firm entered a shop in London, and asked for a knife marked 'Rodgers & Sons.' When it was put into his hand, he asked if it could be warranted. The shopman, instead of answering the question, produced another knife, bearing his own name, and offered to warrant that. The incident revealed to the cutlery firm the treacheries of equivocal methods of advertisement, and they resolved henceforth to stamp only their own name on their own goods. The struggle to carry out their resolution was a costly one, but the principle was worth contending for.

Even in ordinary press advertisements the age of an old-standing firm is a point to which attention is often drawn, directly or indirectly. One may cite, as instances taken at random, Messrs A. & F. Pears and their pictures of patrons in olden times alighting from sedan-chairs; the bacon of the 'House of Harris,' famous for over one hundred and fifty years; and the Horrocks's long-cloth, recommended by 'six generations' of British womenfolk. All these have passed the century; and, indeed, no business which has not done so can well claim to be an old firm by the side of so many which have. Yet, what a number of world-famous firms would be rejected by such a standard as a century! Whole districts, like that of Cleveland, with its great iron industries, and many industries now of the highest importance, such as the india-rubber industries, would be eliminated. In looking for old firms one must search the old industries, like paper-making, coal-mining, cloth-making, iron-smelting, soap-making, even starch-making. It is not necessary that these should be of primitive and fundamental importance, for, as already said, the history of industrial firms does not go very far back. Yet it is probably among the primitive industries that the most astonishing examples of long family connections would be found if the facts could be investigated. In connection with the recent sales of the Duke of Rutland's estates, it was said that many farms had been held by the same families for hundreds of years, and that one farmer 'is still working practically the same holding on which an ancestor settled in the days of King Stephen.'

THE CLOISTER'S SHADE.

In some secluded cloister's shade
There grows a floweret fair;
At evening-time, when vows are paid,
'Tis thither I repair.
My heart is steeped in wondrous peace
Beneath these sheltering walls;
My soul seeks vainly for release,
From out her prison calls.
Be patient still: this lesson know,
Which Nature's art reveals,
That only they who pass through woe
Shall break their prison seals.
When sinks the sun in twilight's hour
My swift heart, longing, calls,
There virtue sways a sceptre's power
And all my sorrow falls.

FERGUS FERGUSSON.

THE MILKY WAY.

By Professor GEORGE FORBES, M.A., F.R.S.

I.

ON a very clear night in our latitudes attention is often drawn to the Galaxy, or Milky Way, with some wonder as to what is the meaning of that pale arch or band of light stretching across the sky from horizon to horizon. If any consider it to be without beauty or interest, they will be surprised to be told that, after becoming aware of its full significance, they will look upon it as the most wonderful and sublime and beautiful of all celestial phenomena. But so it is, and it has become more and more so as the discoveries by astronomers have disclosed its constitution, and its significance in the universe.

Only one-half of the entire belt can be seen above the horizon at once, the other half being below, exactly opposite the visible half. Indeed, there is a portion of it which can never be seen in our latitude, being so near the south pole that it is always below our horizon. If the earth were annihilated, or made transparent, so that we could see the whole celestial sphere at once, the Milky Way would appear as a complete belt surrounding us.

Unfortunately for us, the hidden parts are the grandest and brightest. In southern latitudes the Milky Way does not look like a mere appanage of the starry firmament. It dominates everything, and often overwhelms the stars by its brilliance. There, too, our interest is increased by the gaps of blackness that disturb its continuity and puzzle our understanding. At the Southern Cross there is a pear-shaped vacancy so conspicuous and remarkable as to arrest the attention of the most careless gazer. It is called the 'Coal-sack.' Its size is about eight by five degrees, and this jet-black vacancy, in the middle of one of the most brilliant patches, contains only one star visible without a telescope. Either the light of the Milky Way is there obscured by a black cloud among the stars, or else there is a hole going right through the Milky Way.

Then, again, in the southern hemisphere we discover a great longitudinal black rift along the central line of the Milky Way; which is, in fact, thus divided, over a length of a hundred and fifty degrees, into a main stream and a side branch. This rift starts at the bright pair of stars, alpha and beta Centauri, which point to the Southern Cross. The main stream and the partly interrupted branch then exhibit the very richest and most brilliant portion of the Galaxy, in passing the constellations Sagittarius, Scorpio, Ophiuchus, and Aquila, to meet again in Cygnus, where the rift may be well seen in northern latitudes. From Cygnus the bright belt, no longer divided, continues to Cassiopeia, where it is only ten or fifteen degrees from the pole. It then passes by Perseus, Taurus, and Orion, west of Sirius, to the southern constellation Argus and the Southern Cross.

The great rift is a source of wonder to every one in the southern hemisphere. It is so surprising that often, on board ship, when coming on deck after dinner and looking overhead, one sees the bright sky blotted out, as it seems, by the foul black smoke pouring from the steamer's funnel and streaming away aft, although the ship is burning smokeless coal. It takes some minutes to realise that the sole cause of the phenomenon is the black rift in the glowing Milky Way.

There is still another reason why the southern hemisphere of the Milky Way is the more interesting. It is only there that the Magellanic Clouds can be seen, two glowing cloudlets, like detached fragments of the Milky Way.

In those regions the Galaxy is resplendent. It no longer resembles a mere wash of white paint upon the celestial vault. It suggests an assemblage of luminous clouds, and may well give to the beholder a fancy that the Creator has taken great handfuls of universes, like snowballs made of myriads of stars, and has hurled them into the ring of light, there to spread out and encroach on one another; while some parts of the ring seem to have escaped the bombardment, leaving blank spaces; and two throws seem to have missed their aim entirely, and formed the Magellanic Clouds.

When Galileo was so fortunate as to be the first to point a telescope at the midnight sky, he could not fail, and did not fail, to make a great discovery every night. One of the most gratifying revelations granted to him was the discovery that the Milky Way is no continuous cloud of nebulous light, but consists of multitudes of minute stars too feeble to be seen individually without a telescope. And now, in the twentieth century, we are discovering that, in all our researches about distances, movements, sizes, and constitution of the heavenly bodies, this galactic plane, the central line of the Milky Way, is the fundamental basis for the construction of a comprehensive cosmogony, that shall enlighten us as to the construction, and as to the laws underlying the movements, of the whole material universe.

II.

What is the form of the space which is filled with the stars of our Galaxy? This is a problem that has been puzzling the speculative section of astronomers, from the days of Sir William

Herschel, the father of modern sidereal astronomy. And it is a pleasing fact that the huge mass of observations bearing on the Milky Way, accumulated during the present century, support the assertion made by that great man to the Royal Society in 1785. The heading of one of his sections was this: 'We inhabit the planet of a star belonging to a compound nebula of the third form.' Speaking of the Milky Way, he then said: 'I shall now proceed to show that the stupendous sidereal system we inhabit—its existing stratum and its secondary branch, consisting of many millions of stars—is, in all probability, a detached nebula.'

There is now little doubt that the space occupied by the stars of the Galaxy is in form like a ring surrounding us, filled with clouds of stars, streams of stars, and nebulous gases; also, that between us and the nearest part of that ring there is a more uniform distribution of stars in every direction in a spheroidal or bun-shaped space, within the ring. The massing of the stars in the direction of the median line of the Milky Way (the galactic equator) is not due to crowding, but to the vast depth of the stratum. In higher galactic latitudes there is probably a much more restricted distance within which stars may be found. The more we increase the power of our telescopes, the more faint stars do we find in more distant parts of the Milky Way. Or, as Newcomb has forcibly put it: 'If we should blot out all the stars visible with a twelve-inch telescope, we should find that the greater part of the remaining stars were in the Galaxy.'

The question now is, 'What would this ringed space of star-clouds and star-streams, and the bun-shaped central spheroid, look like if seen from the outside?' Before attempting an answer, we notice that the telescope, assisted by photography, shows among the stars many objects that were called 'nebulæ' when first discovered, from their cloud-like appearance. They were supposed to be masses of glowing gas. Increase of telescopic power partially resolved many of these, in Herschel's time, into star-clusters, some of them globular, or oval-shaped, and condensed at the centre, others disc-like and of uniform luminosity like a planet's disc of a milky colour, others quite irregular and apparently irresolvable. Herschel always maintained forcibly the view that the two last classes are gaseous, and are not resolvable into star-clusters.

After the late Lord Rosse had constructed the then greatest telescope in the world, 72 inches in diameter, he used it for studying nebulæ. He discovered that with his great magnification a large number of them showed a spiral form, and many of those which had hitherto looked like clouds could be resolved, as Galileo had resolved the Milky Way, into countless groups and sprays of small stars. It then seemed probable that, with increased size of telescopes, all nebulæ would be resolvable into star-clusters.

This expectation was for ever dispelled, and Herschel's surmise proved correct, when, in 1866, Sir William Huggins directed the new instrument of research, the spectroscope, upon the great nebula in the sword of Orion. Seen through a spectroscope, the light from most nebulæ (the spiral ones) is spread, like the sun's light, into a continuous 'spectrum,' or ribbon of colours from red to violet. But the light from the Orion nebula showed only a very few definite colours. This proved to those familiar with the spectroscope that the light came from glowing gas, and the first gas to be recognised by the colours emitted was hydrogen. Since then helium has often been found in gaseous nebulæ, and also an element quite unknown among terrestrial substances, to which the name 'nebulium' has been given. All of these gaseous nebulæ are in, or close to, the Milky Way or its branches.

But this is not all. Of late years astronomers have been convinced that in the Milky Way there are a great number of dark, non-luminous nebulæ which blot out the stars that lie behind them. Ordinarily, the known gaseous nebulæ shine by virtue of their temperature or electrical excitation. When these are insufficient, the gaseous nebulæ are non-luminous. One of the most striking first-fruits of the gigantic 100-inch telescope, completed at Mount Wilson, California, in 1918, is a photograph of a nebula in the belt of Orion, a part of which is obscured by a well-defined dark nebula, like a black rock rising out of a luminous ocean.

Then photography has extended the Great Nebula in Orion's sword by showing fainter outlying parts enveloping most of that constellation and the sky round it. So too the Pleiades and Hyades are enveloped in similar nebulosity, as also other parts of the Milky Way.

The general result is that we now know the Milky Way to be the home of gaseous nebulæ, both bright and dark. The spiral nebulæ, on the other hand, are composed of clusters and sprays of stars, and give a spectrum like the stars, nearly continuous from red to violet. They show a distinct tendency to avoid the Milky Way.

Sir William Herschel, in 1785, surmised that the whole of our sidereal system is one example of the class now known as spiral nebulæ. These, when sufficiently magnified, have a shape something like the white foam you may see in the eddies of a swift river when it sweeps past a jutting-out rock, or like the froth on a cup of coffee when stirred to give to it a circular motion. Radial star-spangled arms are often seen, of spiral form, issuing from a bun-shaped centre.

The modern view of the constitution of our sidereal system goes even farther than Herschel's surmise. It now seems more than probable that the whole of space is practically void of stars, except where the spiral nebulæ exist as 'island universes'; and that the whole of our sidereal system, with the Milky Way, is only one, and

not the largest, of these countless spiral nebulæ revealed to us in the beautiful photographs by the gigantic reflecting telescopes of the present century, like our great 73-inch telescope at Victoria, British Columbia, or the 100-inch at Mount Wilson.

III.

What types of stars do we find as the principal constituents of the Galaxy? The most important discovery about the constitution of the stars by the spectroscope was Father Secchi's classification of stellar spectra. It has been extended and subdivided, but it remains fundamental, basic. Every one has noticed that some stars, like Sirius and Vega, have a kind of steel-blue colour, being whiter than Capella, Regulus, or Altair, which are yellow; and a few, like Aldebaran, Betelgeuse, and Antares, are ruddy. The spectroscope analyses the colours in a star's light, arranging all the colours of which this light is made up in a tinted ribbon of coloured light from red to violet, crossed by dark lines. The positions of these lines in the ribbon spectrum indicate the chemical elements that exist in the stellar atmosphere. Thus iron is represented in the spectrum of the sun or of Capella by hundreds of dark lines whose positions have been measured in our laboratories by vaporising a piece of iron at luminous temperature.

Secchi found about half of the stars to be of one class and half of a second class. Class I. includes those like Sirius, the white stars, their spectra being due chiefly to the gas hydrogen, the lightest element, with the smallest atomic weight of all substances. Class II. contains those stars like the yellow Capella or our sun, their spectra being due chiefly to metals, including nearly every metal known on the earth, except the heaviest ones. Classes III. and IV. are very small in number. Both are red stars: III. due largely to oxide of titanium, IV. to carbon compounds.

Of the two principal classes I. and II., those of the second class are distributed pretty uniformly over the sky, and are certainly predominant in the bun-shaped space that is inside the ring of the Milky Way. But Class I., hydrogen, are crowded into the Milky Way. Later research since Secchi's pioneer work made a separate section of some stars in Class I., those that contain helium, the second lightest gas known on our globe. These not only frequent low galactic latitudes, but are confined to certain longitudes also. The helium stars are among the most specially localised types of stars known.

These few facts, taken alone, might lead us to say that, if our sidereal system is a spiral nebula, with a central bun-shaped space like other nebulæ, then the central space is the seat of metallic elements, out of which stars of Class II. and the sun and the earth have been made; and the radial arms in our nebulæ are the seat of hydrogen, except one or perhaps two of the arms, which are helium. Such a supposition might at this stage be natural; but astronomers of to-day generally favour a different interpretation of the diversity of spectral types. This would be a fitting subject to put forward with the prominence it deserves on another occasion.

There is another type of star favouring the Milky Way, distinguished not by their spectra, but by the fact that they vary in brightness up and down in short periods of a few days. Excepting the hydrogen stars of Class I. and these variable stars, all other kinds known to cling to the Milky Way—that is, to low galactic latitudes—are stars whose spectra show bright lines or bands instead of, or in addition to, the dark lines of the normal classes. These are (1) Wolf-Rayet stars; (2) Secchi's Class I., with bright hydrogen lines added; (3) new stars; and (4), as already stated, gaseous nebulæ. It will be well to say a few words about each of these.

IV.

Soon after the spectroscope was applied to astronomy, a class of stars began to be discovered having spectra quite different from any of Secchi's four classes. They are called, from their discoverers, Wolf-Rayet stars. They can easily be recognised by the eye, even with a weak spectroscope, for the spectrum then seems to be all concentrated in two bright bands, one in the blue, the other in the yellow. With the increased power given by photography, these and other wide bright bands are shown on a faint continuous spectrum.

Thus we learn that stars of this type are made of luminous gas, as are the nebulæ that haunt the Milky Way. Now there is no feature of local concentration in space more marked than the presence of all the known Wolf-Rayet stars (except some in the larger Magellanic cloud) within a few degrees of the central line of the Milky Way.

Their connection with planetary nebulæ having a star as a nucleus has lately been proved by the discovery that the nucleus star is always a Wolf-Rayet star.

The next class of stars with peculiar spectrum which haunt the Milky Way are stars of Secchi's first class, the hydrogen stars, exactly like the others, except for the addition of *bright* hydrogen lines in their spectra.

Finally, all the new, or temporary, stars that suddenly burst forth into great brilliance, and slowly fade away, are, with one exception, found in the Milky Way, and generally in those longitudes where the gaseous nebulæ most do congregate.

Concerning these novæ, all that can be said at present is that their great brightness is largely due to glowing hydrogen gas, showing as bright bands superposed at first on one of the ordinary stellar spectra; that the stellar spectrum grows

faint and disappears; that to the bright hydrogen lines are added later the bright lines of Wolf-Rayet stars, chiefly due to nitrogen; and that when all of these have gone, there remain generally only certain bright spectrum-lines due to the unknown element 'nebulium,' which belong to nebular spectra, but to no known terrestrial substance.

Now there is a remarkable fact about this nebulium. Our natural philosophers have lately made great progress in discovering the structure of atoms; and Professor Nicholson has been able to connect the spectrum-lines of an element with its atomic weight. In this way he arrives at the conclusion that the atomic weight of nebulium is three, that of hydrogen being one, and of helium four. This, however, is only a tentative hypothesis.

Hence all of the gases peculiar to occupants of the Milky Way are the lightest known gases, a curious and interesting result. And an equally important generalisation is that all of the heavenly bodies that exhibit in their spectra the bright lines of hydrogen, nebulium, and nitrogen are very markedly localised in the Galaxy, while others that do not show bright lines, but which also frequent the Milky Way, have their spectra dominated by hydrogen and helium.

V.

Such are the facts or data that astronomers are hoping to combine into a complete theory of the constitution of the Galaxy. We have to confess that up to this date none of the theories that have been suggested is sufficiently complete to explain all the facts. There is, however, some satisfaction in finding that the work done by astronomers of late years has brought so many diverse problems under general heads. This is always the first step to any complete theory in natural philosophy.

This very brief summary of the very important position held by the Milky Way for unravelling the mysteries of the stellar universe cannot fail to give us a new interest in that wonderful belt of light surrounding our stellar system. Even when looking at the comparatively pale features of its northern regions, we can no longer fail to add to our mental picture the splendour of the southern parts, 'trailing clouds of glory,' with the glowing luminosity of stellar multitudes, the rifts and dark patches, and two offshoots in the Magellanic Clouds. Nor can we fail to associate even with its paler aspects the revelations of the telescope and the spectroscope. We recognise in this belt of light a key to the architecture of the heavens, probably a spiral nebula, one archipelago of stars out of a million, a mere fragmentary sample of the immeasurable contents of infinite space. Our greatest Scottish astronomer, the late Sir David Gill, said to a friend, 'My idea is that, if you could get up to the nebula in Andromeda, you would see our stellar system and the Milky Way looking very much as the nebula in Andromeda does to us.'

When we realise the immense distance that separates us from the nearest edge of the Galaxy, and the inconceivable distance beyond, to which that belt extends; when we realise that all the orbs contained therein are pursuing their courses in periods that are incalculable, we begin to look upon the Milky Way as symbolical of both infinity and eternity.

I saw Eternity the other night
Like a great ring of pure and endless light,
All calm, as it was bright;
And round beneath it, Time, in hours, days, years,
Driven by the spheres,
Like a vast shadow moved, in which the world
And all her train were hurled.

And when we further realise that the distance we must penetrate to reach the external coils of our own island universe is as nothing compared with the distance to our nearest island-universe neighbour, we have to extend our notions both of infinity and eternity.

And there, on any one of those spiral nebulæ, people perhaps do see their own celestial sphere, just as we do ours, with their own private sun, their own private solar system, their own private firmament of stars, their own private Milky Way; while our sun and solar system, and firmament of stars and Milky Way, which seem to us so important a part of the material universe, must be invisible to them except with a large telescope, aided by the boldest flights of photographic art. What a vast image of immensity is thus opened to our view! Unfathomable depths unfolding problems to delight countless generations of astronomers in the centuries to come.

MAN'S WORK.

CHAPTER VIII.

I.

SPENCER MARTIN'S private office, on the twenty-second storey of a lower Broadway building, was big, like himself. For a desk he used a large, mahogany, glass-covered table, out of which a segment had been carved to accommodate what he called his bow-window. From this desk he could see the harbour, and Governor's Island, and the teeming traffic that ploughed in from the Seven Seas. He stood something under six feet, with a vast paunch, huge shoulders rounded with fat, a reddish face, a ponderous lower jaw, pendulous cheeks, and small, blue, gimlet eyes.

He was looking over his Texas production report when Sitwell's card was brought in. Glancing at it indifferently, he went on with his figures. They were very satisfactory. Presently he grunted and picked up the card. 'Who is he?'

The secretary shook his head. 'I don't know him, sir.'

'What does he want?'

'I don't know that, sir, except that it's personal.'

'It's always personal. Find out.'

The door closed, and Martin turned to the news from Mexico, where he had large interests. He began to frown, and pushed a button at the edge of his desk. The secretary reappeared.

'Mr Sitwell says that——'

'Forget it. How much are we paying that Alcade down in Tampella?'

'Five hundred dollars, sir.'

Martin tossed over a report. 'Jenkins says he's having difficulty in getting labour. Wire him to double that payment and demand results.'

'Yes, sir—and Mr Sitwell?'

'Sitwell be darned! I'm busy.'

The door closed again, and Martin's mind pitched back to Mexico. He was almost sorry he had ever committed himself there. What with labour trouble, insecurity of title, and Government extortion, it took a big production to make money. But he was accustomed to having his own way and carrying things through, and hated to withdraw. Had Mexico had decent administration it would have been all right. He pondered over this for a while, then absently picked up Sitwell's card. In one corner he saw 'California oil properties.' He pushed the button again.

'Show him in.'

If the truth were told, Sitwell entered with his heart in his mouth. To seek an interview with Spencer Martin was like fingering the door of a lion's cage. But for once in his life the promoter was fortified: what he had to say was unadulterated fact, and he could prove it. So, when Martin glowered at him from under thick bristling eyebrows and motioned to a chair, he sat down, quite collected and ready for the ordeal.

'Good-day. What do you want?'

Sitwell nodded and began. Knowing what manner of man this was, he had very carefully rehearsed what he would say, and determined to be as brief and to the point—if he could—as Martin himself.

'Forty miles south of Los Angeles there's a big anticline. It's broken by a fault; and——'

Martin pressed the bell automatically. 'Bring me the maps of the Richfield Anticline, Southern California.' He leaned back, surveying Sitwell in total silence. The latter knew better than to speak before his turn, so contented himself with examining the office—its mahogany furniture, with the Persian carpet and other costly equipment. Presently the map was unrolled on the big desk.

'Go on,' snapped Martin.

'This anticline is broken by a fault, and continues half a mile farther south. It's all productive ground, and yields about half a million barrels a day.'

Spencer Martin cleared his throat. 'Well, what about it? Tell me something I don't know.'

Sitwell leaned forward with his most courteous air. 'The throw of the fault has never been established till'—he paused for an impressive moment—'till last week.'

The big man laid a podgy finger on the map. 'Go on.'

'Where it has been discovered there's shale on the surface. On the anticline the shale is down five hundred feet. That takes that amount off the necessary depth of the well.'

'Obviously; but I'm not interested.'

Sitwell's face did not alter a muscle. 'Perhaps you will be when I tell you that the discoverers will not be able to exercise their option. They don't know it yet, but I do.'

The small eyes grew even smaller and sharper. 'How much shale is there, and how far from the anticline?' It was the first promising question Martin had asked.

'Fifty acres, about, and half a mile away; that's the throw of the fault.'

'Go on.'

'This ground is underlaid by oil-sands of the anticline. I have it on high authority.'

'Whose?'

'I can't very well tell you. I'm not supposed to use his name.'

Martin made a sound like a mastiff's bark. 'Good-morning.' Then he got out of his wide armed chair, stumped to the window, and stood staring at the slim hulls of the ships furrowing the Hudson River. 'Good-morning,' he repeated over his shoulder.

'His name is Woolley, the State Geologist.' Sitwell's voice sounded jerky and unnatural. His face looked a sickly yellow.

The big man wheeled suddenly. 'Why couldn't you tell me that before? Don't you think I'm a safe one? Think I'd be where I am if I couldn't keep my mouth shut? Now go on.'

'This fifty acres is virgin ground, with deep sands. The present option will expire in about three months and a half, and,' he added, 'I've got the next one.'

'But if the other fellows win out?'

'They can't—they haven't money enough.'

'Who are they?' demanded Martin with sudden interest.

'One is Harrison, a drilling contractor; the other a young fellow called Shanklin, who was recently fired from a law-office in Los Angeles.'

'How far have they got?'

'The well's just started, with Harrison's rig.'

The big man pushed out his lips. 'You said just now that they would not be able to exercise their option. How can you be sure of this?'

'If they do, it's because I've gone to sleep.'

II.

Martin settled down in his chair again and bent his small eyes on the map. It struck the visitor he looked like an overfed pig, dressed in fine clothes. A great solitaire diamond glimmered on a fat finger. He was not pretty, but he looked amazingly capable.

The finger moved along the diagram of the anticline to where the fault sheered it off, then westward a little.

'That's the place?'

'Yes.'

There was a little pause, and Sitwell held his breath.

The finger moved to the bell, and, simultaneously, it seemed, the door opened.

'Is Mr Hunt in?'

'Yes, sir.'

'Send him here.'

A young man came in, of middle height, with a firm mouth and quiet, brown eyes. Sitwell regarded him attentively, and was immediately impressed by the resemblance to some one he knew—he could not remember whom. Then he smiled a little. It was to Shanklin. The thing was grotesque—the men were so similar.

'Hunt, this is Mr Sitwell of Los Angeles. Haven't been in that country, have you?'

'No, sir.'

'Then look here.' The fat finger pointed to the diagram. 'Mr Sitwell tells me the throw in the Richfield fault has been located. That's it.'

Hunt nodded.

'Look up what information we've got on those sands, and let me know in ten minutes.'

The young man disappeared. Spencer Martin pushed away the map and surveyed his visitor with the least suspicion of a twinkle. 'Mr Sitwell, I suppose you came here because you've heard I want to operate in California?'

'That's quite true.'

'About ten men come in every day for the same reason, but they don't usually get as far as you have. It's a fact that I do want to operate there. Now, in case your statements are verified, what's your proposition?'

Sitwell did not stir a muscle. He was playing the biggest game in his life—and almost enjoying it. It was wits against wits now, and his shrewdness stood alone against the weight of the other man's wealth and reputation. Spencer Martin was not the kind out of whom money could be made quickly. He was too sharp for that. But he was the kind who would stake a fortune when he thought a fortune was in prospect. The mere possibility of being associated with him seemed to Sitwell to satisfy every ambitious dream.

'If you think I've come here to try to make money out of you, you're mistaken, Mr Martin. I don't need your money—at least, not yet.'

The big man nodded. 'That's the talk. Go on!'

'I've got an option which promises to turn out the biggest thing in southern California. I can sell it, but I don't want to. What I am looking for is a partner who will help me make sure that my option is good, and will develop the property later on. I don't want you to take my word for anything. Come and see for yourself.'

'I don't know a darn thing about it myself,' said Martin suavely. 'I hire men who do. The fact is brains are the only cheap thing in the market, but it needs guts to buy them. There's that fellow Hunt—knows more already than I ever did—and I pay him what?—three thousand a year—and he's tickled to get it. I pay three thousand a year for cigars. Difference between guts and brains. Go on!'

Sitwell smiled. 'I've said all I've come to say.'

The big man sent him a grudging glance of admiration. 'Well, then, how much?'

'Five thousand and a half-interest. You pay expenses meantime, and the cost of development.'

'What expenses?'

'The outlay in securing that work does not progress too rapidly for the next three and a half months,' said Sitwell coolly.

Martin's left hand stole up to his heavy chin and caressed it slowly. 'Any suggestions?'

'Do you need any? You're longer in the game than I am.'

'Perhaps not. Should I leave that to you?' The broad face wore a grim smile. 'Here's Hunt.—Well, what about it?'

The young man laid a rough, hastily sketched diagram on the desk. 'Last report of Woolley, State Geologist, gives no estimate of the throw of the fault in the Richfield anticline. There has been much erosion in the valley to the west, and this is supposed to have destroyed whatever portion of the ridge was shifted. Shale is reported five hundred feet down, oil-sands about twenty-five hundred. Present production about half a million barrels high-grade oil. Union, Western, Richfield, Pacific Coast are principal companies operating.'

Martin grunted. 'And suppose one did find that bit of lost anticline—what then?'

Hunt glanced at him. 'It should mean a big production. It's virgin ground.'

'Come back in another ten minutes.'

III.

Hunt closed the door gently, and Martin turned to his visitor. 'When do you go west again?'

Sitwell smiled. 'When I've made satisfactory arrangements.'

'Look here, you said I've been in the business longer than you have. That's right. You reckon that I'm a bit of a plunger; that's right too. So far, I'm with you. Now as to your proposition—I'll take it up—with one alteration, which is that you get your five thousand the day that option comes into my hands. I won't pay an advance profit on a speculation you thought good enough before my name ever came into your head. As to expenses—I understand—and will meet them up to a certain amount, but you will personally report by letter just what you spend and how you spend it. When the property comes into my hands, you can make out partnership papers. I'll sign 'em, and pay cost of development. And it will be the first time I entered into partnership with any one. You know what that means to you, or you ought to. All this is on the understanding that Hunt confirms what you've told me. You've put up a good story, and I'm inclined to believe you, but, on principle, I don't believe anything till it's confirmed. There's just one thing. If through any oversight of yours that first option is exercised, you'll be sorry you ever saw me. That's my offer—take it or leave it.'

Sitwell made a little gesture. He had tacked on the five thousand, though really not expecting to get it, but there were conditions that he did not fancy. He looked at the big man, who was lighting one of his famous cigars, and reflected that to be Martin's partner was something which would establish him for ever. The contemplation of it gave him a sharp sense of pride.

'Will you put that on paper?'

'I'll put nothing on paper till I get a report. What do you take me for? This isn't the only chance I have to get into the California field. If you want to bet, I'll lay you a thousand dollars another one comes along inside the next hour. You've got my proposition.'

The door opened softly and the secretary said something in an undertone. It was only a whisper, but Sitwell caught the name of a man pre-eminent in oil circles.

'Ask him to wait.' Martin turned to Sitwell with the movement of an impatient elephant. 'Take it or leave it—quick'—and, at the latter's involuntary nod, 'Send Hunt here.' He drummed thoughtfully on the polished glass of the big table. 'What are you doing to-night?'

Sitwell had a flash of inspiration. 'I'm having you to dinner at Romano's. I want you to meet my wife.'

Spencer Martin grinned. He liked the daring of the thing, and began to wonder whether this was not the kind of associate he had always been looking for, but never so far found. Just then Hunt came in, and stood waiting.

'You go west with Mr Sitwell to-morrow. Get to Los Angeles nine o'clock Friday morning. The property he will show you is forty miles out. That's an hour. Look it over, and leave Los Angeles that afternoon by the Sunset Limited. Get back here on Tuesday with your report. You've got to leave Tuesday night for Pennsylvania. Burbridge is in some kind of trouble. Tell the office to get accommodation; draw what money you want; and wire to have a car meet you. That's all.'

Hunt nodded and went out. He did not seem at all surprised, for this was Martin's way of doing things. The latter examined his cigar and scrutinised Sitwell's face, which, though his heart was beating rapidly, had remained impassive. Again the big man felt a throb of approval. He had wanted to discover just what might be this visitor's code, and how it matched his own. And as a matter of fact he made a remarkable, if swift, analysis of Sitwell, putting him down as shrewd, not scrupulous enough to interfere with business, and an excellent actor. Sitwell, he then and there decided, was the kind of man he could use.

'Steer Hunt out to your option and let him alone. He doesn't need any help. If this thing goes right, it may lead to others. I make no promises—but you can draw your own conclusions. My name doesn't appear in this matter till you turn over the property. Is that understood?'

'Perfectly.'

'Then when do you dine?'

Sitwell got up and stretched himself. To all appearances this might have been the end of a conversation in which he had long lost interest. 'Eight o'clock suit you?'

'Yes; meet you then.' If Sitwell had said half-past seven, Martin would have changed it to eight. He liked to approach the table feeling like a hungry wolf.

IV.

Sitwell entered his hotel twenty minutes later, treading on air, but preserving outwardly an unbroken calm. He told himself repeatedly that this was not the time for excitement or elation. He had made greater progress than he had dared hope, but there was difficult work ahead of him, and he admitted quite frankly that it would be a contest of underhand trickery against decency and honest effort. He did not like the idea of those periodical reports to Spencer Martin; but against that he put the dream of a partnership with so outstanding a personality, with its consequent fortune and progress. He felt himself potentially a bigger man than ever before. Self-possession had served well that afternoon. He would maintain it henceforth.

Claudia looked at him anxiously as he opened their door. She had spent the last few hours

looking in shop windows. All she could afford, except one new evening frock, on which her husband had insisted, was to look. Now her eyes were bright and strained, and her face was a little flushed. She had counted the moments, being aware of what was at stake.

'Well?' she said unsteadily.

Sitwell nodded contentedly. 'Martin accepts my proposals. He's sending an engineer out with us at once.'

'Does that mean——'

'Success? Yes—undoubtedly. Also, he has suggested a partnership.'

Her eyes rounded. 'Is he very wealthy? Oh, Bertie, I'm so glad.'

'He has anywhere from ten to twenty millions,' said Sitwell coolly.

Claudia felt a little dizzy. She had never seen her husband display more poise—and this at a moment when poise was unnecessary. She felt suddenly impressed, and more confident.

'That means that you will be able to straighten everything out, and we can live in the east.' She gazed out at the pyramidal skyline of New York. 'Perhaps here!'

'If things go as I expect, we shall probably have to live here.'

She sighed with happiness at the thought. 'And when do we go back?'

'To-morrow. Martin's engineer goes with us. He spends less than a day out there, and then starts for Pennsylvania. Martin has interests all over the country.'

'To-morrow. Oh, no!'

Sitwell pushed a stud into his dress-shirt. 'I'm lucky—darned lucky—that he's coming at all. Martin's dining with us at eight. That's luckier still.'

Somehow she did not seem impressed. Why shouldn't Martin dine with them if they could afford it?

'What sort of man is he?' she asked curiously.

'No beauty—not a ladies' man—but I take it that he knows a pretty woman when he sees one.' Sitwell surveyed her slim shoulders and exquisite face approvingly. 'That's why I'm mighty glad you're here; so put on that new dress and look your best. This is one of the places on the road of life where a girl can help her husband. Martin's a rough diamond, but you must overlook that. This is probably the most important evening of our lives,' he concluded impressively.

(*Continued on page 197.*)

ENGLISH PRISONS.

By JOHN C. GOODWIN.

Dartmoor is a tidy place;
Chatham the terror of our race.
Portland is not quite so bad;
Broadmoor is for those stark mad.
Pentonville's the Hell of London;
Borstal—if you're there you're undone.
Portsmouth is a noted shop;
Brixton is a regular cop.

THE above lines, written on the wall of his cell by a convict of a poetic turn of mind, embody his views on prisons, within some of which the bard had enjoyed His Majesty's hospitality.

Everything depends, however, on the point of view. Life in a prison is not meant to be a bed of roses—were that so, there would be no housing shortage. But life in some of our large penal establishments may be better understood through a closer inspection of the buildings and their occupants.

The Jesuit Fathers are said to boast: 'Give us a child until it is seven years old, and after that you may do what you like with it.' This principle is followed, to a certain extent, at Borstal, where the youthful criminal is taken in hand at the most impressionable age, and his character moulded on right lines, instead of his being allowed to receive savage and brutalising impressions, either in the animal existence of slum-life or through the harsh, soulless agency of prison routine.

Borstal is situated at Strood, near Rochester, the two, with the addition of Chatham, forming practically one large town. There is accommodation for three hundred boys in the institution. The Borstal system was originally introduced by Sir Evelyn Ruggles-Brise, K.C.B., the late Chairman of the Prison Commissioners, who believes in the principle that criminals, especially young ones, should be led, and not driven. To this end the boys are educated, put through physical drill, allowed indoor and outdoor games and books; while after tea, instead of returning to their cells, as in the case of the inmates of other prisons, they are allowed to sit about in the common-rooms and talk with the warders and with each other. Their cells are larger than the ordinary prison cell, and furnished with bookshelves and iron bedsteads and other comforts. The institution, in fact, resembles a military barracks rather than a place of punishment, and were the warders on duty on the walls and the watch-tower in military uniform, the illusion would be well-nigh complete.

Like many other ventures concerning the betterment of the conditions of the 'under dog,' the Borstal system has been strongly criticised; but the answer to the reactionaries who would, if they were allowed to have their way, reintroduce the thumbscrew and the stake into our penal code is that 'the proof of the pudding lies in the eating,' and that the Borstal system, so far

from 'nursing criminals,' cures them, for over 50 per cent. of the discharged Borstal boys never see a prison cell again. So successful, in fact, has the system proved that Portland Prison has recently (1921) been converted into a Borstal institution.

Brixton Jail, pleasantly situated on Brixton Hill, is a 'remand' prison for the temporary accommodation of those who are not yet convicted and sentenced. Their friends are allowed to see them daily if they wish, and, as befits the nature of the place, there is a total absence of the rigorous prison discipline that prevails elsewhere. Prior to its present use Brixton was a military prison.

Should an offender be sentenced in the London district, he will probably find himself in Wormwood Scrubs, or Wandsworth, or Pentonville, which are, so to speak, 'clearing-houses' for those on their way to durance vile. Here most of them remain for twenty-eight days *en route* for the 'local' prisons, where they serve the next one to three months of their sentences prior to being finally drafted to the convict prisons, there to serve the longest and hardest part of their expiation. The women, of course, go to Holloway. At 'the Scrubs' there is accommodation for fifteen hundred prisoners, and it is here that finger-prints are taken and the luckless 'lag' gets his first taste of hard discipline.

This latter fact prompted a certain sailor to inscribe the following lines on the wall of his cell:

> Oh, who can tell the pains I feel,
> A poor unlucky sailor?
> I miss my grog at every meal,
> And curse the blooming gaoler.

It is, incidentally, an extraordinary fact that convicts are especially prone to write doggerel rhymes on the walls of their cells, and, indeed, almost anywhere. The writings of criminologists are full of instances.

It is at Wormwood Scrubs that the distinctions in prison dress are first encountered, offenders in the 1st Division wearing a gray uniform, those in the 2nd Division being clad in brown, while the 3rd Division wear a buff garb. All are employed on Government work —making mail-bags and other articles for the public services.

Dartmoor, perhaps the best known of our big convict prisons, is a great contrast to Wormwood Scrubs, being a huge, bleak, rambling range of buildings situated at Princetown, a dreary village on Dartmoor itself.

The prison was originally built for the accommodation of French prisoners during the Napoleonic wars, though extensive additions have since been made. The system of prison dress is more complicated than that at Wormwood Scrubs, and is based upon the number of years of his sentence which each man has served.

The convicts work on farms and quarries attached to the prison, as well as in the buildings in the prison precincts, such as the kitchen, the carpenters' shop, the stonemasons' shed, the laundry, and the sawmill. They rise, as at most prisons, at 5 A.M., and retire to bed at 8 P.M. Those employed on the farms are all men in the last year of their sentences, who have most to lose by availing themselves of the exceptional opportunities for escape which this work offers.

The prisoners are allowed to see their friends periodically, but the privilege is forfeited by misbehaviour of any sort.

The routine at Parkhurst is somewhat similar to that at Dartmoor, quarrying being the main occupation of the 'lags.' For good conduct a convict earns a remission of three months for every year of his sentence.

Women offenders are sent to female convict prisons. Their hours are more or less the same as those of the men, but their work is much lighter, it being confined to gardening and twine-making, apart from indoor and domestic duties, while they enjoy a little more freedom than do the men. The female convict prison at Aylesbury, formerly the chief establishment of its kind in England, is now a female Borstal institution, and is doing most useful work in reforming girls on humane lines.

Wandsworth is a huge 'local' jail, of grave, chilling aspect. Its chief interest lies in the gruesome fact that it is here that most of the executions in the London district take place. Here, too, is the 'E 1 Room,' where are those prisoners who are mentally deficient, though not sufficiently so to warrant their transfer to Broadmoor, the famous criminal lunatic prison.

This asylum-prison is situated at Crowthorne, in Berkshire, and has accommodation for nearly seven hundred inmates. This place, which resembles, and is, a county asylum rather than a penal establishment, is surrounded by attractive grounds, while the view of the neighbouring country is superb.

The inmates have their own string-band, and hold dramatic performances from time to time.

There is at Broadmoor a 'convict class' of patients who are kept apart from the ordinary inmates, and who have become insane whilst serving their sentences at other prisons. It is hardly to be wondered at that the soul-crushing monotony of prison life occasionally drives a man mad.

To conclude with another sample of prison poetry:

> Millbank for thick skins and graft at the pump;
> Broadmoor for all lags who go off their chump;
> Brixton for good grub and cocoa with fat;
> Dartmoor for bad toke but plenty of chat.
> Portsmouth's a blooming bad place for hard work;
> Chatham on Sunday gives four ounces pork.
> Portland's the worst of the lot for to joke in;
> For fetching a lagging there's no place like Woking.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

HOW far along in time must we advance ere what we think of as the historical perspective begins to be established? Some desire an idea upon this matter because of certain affairs affecting the late war in Europe and other parts of the world and various personages connected therewith. But is it not plain that this historical perspective is dependent upon circumstances, and especially those associated with the nature and extent of the problem, the variety and strength of view upon it at the time of its first presentment and after, the degree of emotion experienced regarding it, and the personalities and temperaments of the persons most concerned as subjects, objects, and associates? These factors are interwoven, affecting each other intimately. For an example, consider a case of experience of some violent and most disconcerting, yet nearly harmless, malady of a temporary character; let it be the toothache. At the hour of experience, say in the morning, this affair appears, most distinctly feels of more consequence, more upheaving, than all anxieties of a wrecked political world. To an extent it is a matter of temperament and strength of will, but commonly it is difficult to contemplate with fit seriousness and effective thought and judgment any great question while one is thus harassed; nor can the pain of itself be considered save in a manner of desperation and often hopeless desire for relief. One does not remember any great speech having been made, any remarkable dramatic representation in a theatre, or any other highly creditable performance in the arts while the hero was thus tormented; nor, such torments being as they are known, can we comprehend any man, whatever his philosophy, however fine his strength, setting himself to an analysis of his own emotions and the peculiar suggestions attaching thereto at such a time. Yet in the afternoon, or but an hour after the event, this quite temporary affair, affecting only the individual, and scarcely moving him from the line of his general action and progress, might be viewed with clear judgment, analysis, and the most trustworthy historical perspective—better, evidently, than a week later, when so little of what seemed real would be remembered. At eleven o'clock an individual enjoys a better historical perspective of his breakfast than will be possible to him later. But obviously with greater events, concerning wide communities and of more enduring consequence, the period of preparation of the historical perspective is more extended, obeying, as it seems, almost a simple natural law. Only this season we were presented with the most authoritative biography of the great Lord Salisbury, Conservative Premier of such excellent and solid parts in the closing period of the Victorian era, and the point was presented immediately to the minds of many persons variously interested as to whether the time had yet elapsed—or whether it had not already almost too long elapsed—for the historical perspective to be true. It is eighteen years, some argued, since he who was plain John Morley then produced one of the most splendid biographies in our literature, his *Life of Gladstone*, who was at the time but five years dead; and the perspective seems true enough, with the premise accepted that it was a faithful and admiring—and yet not uncritical—disciple who was writing. Much more recently the official biography of Disraeli has been presented. Each of these two personalities and careers was complex, more so than Lord Salisbury's, more difficult to appraise. Lord Morley's work suggests the special value of that which is written when knowledge and perhaps the love—or it might be hate—still are keen, for then there is revelation, penetration, and atmosphere, and the reader's imagination is set aflame, lighting up the lines with personal interpretation. Twenty years after, and it all looks so much a matter of dead bones and stuff cast off upon the heap of history that seems to matter less and less as years succeed. Rarely an atmosphere, no crimson streaks, reprehensible as they might be in the view of history and art, but gray tones and flat washes. These works, in which the historical perspective is so good and true, seem, for the most part, just semi-instructional things pointing sundry morals for our personal and national guidance, if personally or nationally we are disposed to profit by them—which seldom happens. If the attainment of historical perspective—which evidently must vary with the individual—is regarded as a pleasant intellectual

 [*All Rights Reserved.*]

study, it is good, but in the educative way it is of less value than is supposed. Man may be subconsciously influenced by the past, but it does not appear that he will ever be consciously controlled by it. He will never learn his lesson; he is too much of an adventurer—yearns unceasingly for knowledge of the unknown, the awful secrets, even though he fears, with good reason, that the knowledge will be perilous. It may be unwise of man, but it is his nature, and there is still something to admire for it in the fellow.

* * *

A mistake is often made when the historical perspective is considered or spoken of: after the maturity of time and thought, when the sobering effect of distance has been established, it is supposed to be accurate and constant. But surely this is not so, for see how in centuries judgments upon men and things of the past, the views of them—in politics, literature, art, and all affairs—the characters of personages are differently appraised by the students of succeeding ages, as mental processes of nations, schools, and individuals, for evolution's sake, pass through their unceasing transformations. Civilisation is jealous always of its present capacity in judgment, disregards the past whenever it dare, and establishes new standards, declaring all others to be obsolete. Contemporary circumstance is all-powerful in controlling judgments. See the ups and downs of the celebrities of the past; we are breaking many old idols into little pieces, and from the cobwebbed corners of history resuscitating long-discarded figures and setting them up as demi-gods, workers of incomparable excellence, as we now regard them, who were victims of the sad inappreciation of their age. From this it appears that there is not one historical perspective, clear and constant like the Pole Star, but many; and they may be as radically different from each other as were the opinions of extremists during the burden and agony of terrifying war. It is very early, but some such thoughts bring us to a hesitating question as to whether even now, so soon, we are approaching the hour when the first rough sketch with a historical perspective of certain features of the World War may be attempted. For some time past, with the delirium and the confusion of the past three years, there has been occasional reference to that perspective as being a thing not for our time, or that of the next generation; for it was felt that the war was so big, so vast, is still so incomprehensible, that time must roll away in centuries ere the conflict can be fairly viewed. But if the events were gigantic, and their effects the most drastic, we think more and faster—if not better—in these days. Nothing is clearer than that the mind of the world in regard to some aspects of the war has changed in the last year or two, even the last few months. There is evidence of the circumstance everywhere; suffering, upheaval, disillusionment have hastened on the process, and fear has assisted too. To appreciate the change, consider the financial reckonings that were made at the Peace Conference at Paris, and now, when there are murmurings of debt cancellations. Consider the international political views as they were one year ago, being then moulded in the pure image of the war, and now as expressed by the same individuals and communities, all in their own way. There is a difference here as well, and it is tremendous. To make the point a little clearer, please to reflect upon the difference of view that would be taken now of some of the most important war-books, of the biographical and reminiscent sort, that were produced scarce more than a year ago, from the view held of them at the time of their issue. Nothing could be more revealing of the speedy mutability of human emotional judgments than this. A reader on reverting to and turning over those pages read of yesteryear might sometimes be surprised at his change of self. Take such as the Repington diaries, the Fisher memoirs, and other such for a trial, and see how vastly views have changed.

* * *

The Washington Conference that was called in November was a sign of it. It was a proof that men at last were capable of realising some magnitudes in their fair proportions. President Harding chose his moment well. A ray of the new perspective seems almost to be cast in natural compliment towards Mr Harding himself, for after the end of the war, when the United States appeared disposed to indicate a certain separation and almost an indifference to Europe, as in remorse she licked her wounds, people were wont to speak stupidly of this man, who was a newspaper owner and editor from the middle west, as if he lacked breadth of mind and that magnificent outlook upon the world that is obtained from Paris, ever since Napoleon established the view from there. It was stupid, even in moments of pain, to think for a moment slightingly of such a man, as if it were even possible, through any number of election vicissitudes, expected and unexpected, for any man to become elected to the most important individual office in the world, as it is commonly regarded, unless he were a truly great man. There are varieties and degrees of greatness, and they have been exemplified in the line of American presidents, some of whom have been, comparatively, disappointments; but a man who reaches this position cannot be small or mean or unintelligent, as may a statesman suddenly raised to power in some other places. Mr Harding, however his schemes may fare, bears within him greatness. It was great to choose the period as he did. The League of Nations, magnificent in idealism and desire, was product of fever and pain, and it may have come too soon, and thus made difficulties for itself, even though it were

plainly an ideal to be maintained and worked upon if the world were to be good again. Mr Harding's conference at Washington recognised human limitations, and that worst form of them the politico-human limitations and weaknesses, and it mixed ideals with plain reason and cold facts. But in America, with its intense materialism, one finds always a craving for the romantic, and we see it on the surface of things always like a thin veneer of sentimentality; and thus, with a stage set for an episode in plain materialism, we had Mr Charles Evan Hughes at the first words flinging off it to the wings every property and trapping of old convention, the pretty diplomatic baubles that they play with in the Chancelleries, as the result of which the diplomats and their staffs had come to Washington all prepared for the interchange, among their very numerous selves, according to the exacting tenets of diplomatic etiquette, of just forty thousand visiting-cards. This was cancelled, the ceremonies were abandoned, and Mr Hughes burst upon his highly diplomatic audience with such proposals as at first gave shock, the old diplomats feeling that they themselves never thought and spoke like that. But the sense of it supervened. No historical perspective about Mr Hughes as yet, as perhaps about Mr Harding, although there might have been; it is hardly remembered what a stir he caused nearly six years ago when he opposed Mr Wilson for the presidency, and when it was said of this earnest-minded lawyer, son of a Baptist minister, and intended to be a Baptist minister himself, but educated from his own earnings for the law, that 'there was nobody for Hughes—but the people.' There were times at Washington, perhaps, when it might have seemed that there was nobody for Harding and Hughes again—but the world.

* * *

The mention of Mr Woodrow Wilson brings us sharply to another consideration of the new perspective. It seems to be working fast upon Mr Wilson now, and perhaps not since the time of Napoleon, a very different sort of person, has the world had such violent and opposing views about any man. Three years ago, various peoples just released from war—Germany overthrown and no more need for any fourteen points; the world then more intensely material than it had ever been known to be, far less spiritual than at this present moment, unspiritual though still it be—thought and spoke most contemptuously of Mr Woodrow Wilson. He was derided as a visionary, an idealist most unpractical, then as arrogant, domineering, and even stupid. There is no man about whom opinion has oscillated more rapidly and violently than about Mr Wilson. Before the war he was regarded distantly, dispassionately. It was just a curious thing and no more to consider this university professor—with all his independence and his new schemes for the achievement of liberty and progress—in the seat of the mighty, where Washington and Abraham Lincoln sat. Came the war, and then the Allies looked with unspoken question and anxiety towards that American President. It was natural, and perhaps inevitable, that during the next year or two fighting peoples—fighting for liberty—nerves on edge, judgments in a liquid state, anxieties extreme, should think of Mr Wilson one day as President Good and the next as President Bad. At the time of the 'too proud to fight' speech—a remark always misunderstood—the sentiments of those fighting peoples were of a certain kind; at the time when the United States at last came into the war they were of another, the President being classed then among the more blessed of the immortals. Yet Mr Wilson had not changed. His policy all through that time showed a clear and steady line towards a practical idealism, and he was playing, like an Antony, now this way and now that, seeming to veer and suit sentiment, with the mind of the American people by no means desirous of entering the war, until at last, at the supreme moment of consummation of his effort, he had them all ready and united, and America 'came in.' For such shepherdry the victors of the war owe grateful thanks to the lonely past-President. Later, the war won, Mr Wilson's idealism became less practical, and in Paris, fervent upon his dreamy possibilities, he lost the tact and skill that might have helped him on; while the victors, flushed with conquest and all its unestimated material promise, resented interference, and resented idealism more than they do now. Mr Wilson was like one stoned, and he left Paris a broken man. He was not the first seeker of ideals to suffer from mammon. Perhaps some of it he deserved, most of it surely not. Just think of the difference in popular sentiment towards him at Paris and previously when the States 'came in'! But now, already, the new perspective is settling in the matter of Mr Wilson too; he is perhaps its most difficult problem. It raises the register of his virtues as with few others. Dreamer, idealist, he was before his time. But he was one great individual force in the world, who, more than any other, strove sincerely and fervently for the good of humanity. The Washington Conference itself, how could it be otherwise regarded than as a monument to the truth of the Wilson view, and the need to apply some form of his treatment for universal salvation? His prescriptions at the 'peace-making' were refused; but later, in agony and horror at the appalling catastrophes that were ever looming nearer, panic-stricken, this parley was sought upon the scene where Wilson strove himself, whence he issued that famous message giving his country to the war —'God willing, she can do no other.' Directly

in front of Westminster Abbey in recent times there has been raised a most impressive monument to that great man, true lover of humankind, tremendously strong, almost divinely gentle, Abraham Lincoln. America does well to be proud of him; we serve our good sense and heart thus to seek a share in such wholesome pride. The historical perspective now works to such effect that there are some who think that in days to come Woodrow Wilson will rank there on the heights as well.

* * *

The former President of the United States becomes an example of the quick change of character complexions of great individualities as they are viewed in changed circumstances. During the four years of struggle colours were untrue; Mars orange was laid in washes upon what was essentially ugly; the most stupid militarist was made to glow in heroic tones. It followed that the unmilitarist, whatever other qualities were possessed, was flat in dull drab. So was this university professor, who became first citizen of a great country, and vitally influenced a world at war. He seemed a plain figure then; he was spoken of as dry. He made no attempt merely to beautify his speeches, to draw in metaphors from heaven and earth to their illustration. Like Antony, he only spoke right on. But is there one who had part in the conflict upon whom romance has seemed to glow more and more as the truth emerges from the smoke and stink of war? There is something for thought and significance in this. The picture of the man, broken as he was, the failure of Versailles, making a desperate attempt in an agony of suffering to attend the inauguration of his successor at Washington is the most poignant tragedy. And then a few months later, when leaders of the world were at that moment assembling in Washington to attempt some of the work his League of Nations would have done had the world been ready for it, he himself, somewhat recovered, was accompanying the coffin with the body of the unknown American soldier to Arlington cemetery. On returning that afternoon a great non-partisan gathering assembled before his residence in Washington—almost within the hearing of the assembly of world statesmen. He came, as we are told, out on to the portico to receive a committee whose chairman, Mr Hamilton Hold, said: 'We congratulate you, a wounded soldier of the World War, on regaining your health. We pledge you on our honour to respect your work, which shall not die.' Then Woodrow Wilson spoke publicly for the first time since his illness, saying: 'I wish I had the voice to reply to you, but I can only thank you from the bottom of my heart. God bless you!' The people sang 'My country, 'tis of thee.' There were cheers for the League of Nations, and as they were given Mr Wilson vigorously waved his hat. The Americans are a curious people; their sentiments and conduct are often difficult to understand—like those of every people by other peoples. The mixture in them of sentimentalism and materialism seems peculiar to us. At that emotional moment in Washington did any of those who cheered, while the wife of the man sat beside him weeping, recall or picture fairly to themselves the moments of giant aspiration such a little while before? As, for example, on the Fourth of July in 1914, within a month of the beginning of the war, when in his national address Mr Wilson said: 'My dream is that as the years go on, and the world knows more and more of America, it will turn to her for those moral inspirations which lie at the basis of all freedom: that the world will never fear America unless it feels that it is engaged in some enterprise which is inconsistent with the rights of humanity.' There is a revival in these present times of the disposition of dramatists to make great stage-pictures about personages whose story is more or less familiar to the multitude. Thus one of the best successes in London for some time past has been Mr Drinkwater's *Abraham Lincoln*. It is as yet too soon; but in days to come, what a drama, what a tragedy, what a film of Woodrow Wilson! For in that tragedy will be told the suffering, not of one man, but of the world. The Washington Conference and the appearance of one of the most engrossing biographical books in a season that has been rich in such, the story of Wilson and the War, told by Mr Tumulty, his secretary, inevitably turn the mind to thoughts like these, or others, according to the disposition of the thinker; and then it seems sometimes that the historical perspective is working more favourably to the ex-President than to any other figure in the history of the last seven years. Moods and circumstances are favourable. It is a remarkable book. One day Mr Wilson was talking to Mr Tumulty, and said, 'When we move against Germany we must be certain that the whole country not only moves with us, but is willing to go forward to the end with enthusiasm. . . . I am not afraid to go to war. No man fit to be President of this nation, knowing the way its people would respond to any demand that might be made upon them, need have fears or doubts as to what stand it would finally take. But what I fear more than anything else is the possibility of world bankruptcy that may inevitably follow our getting into this thing. Not only world chaos and bankruptcy, but all of the distempers, social, moral, and industrial, that will flow from this world cataclysm. No sane man, therefore, who knows the dangerous elements that are abroad in the world would, without feeling out every move, seek to lead his people without counting the cost, and dispassionately deliberating upon every move.' . . . .

See how different historical perspective, grinding small like those mills of God, is acting upon some militarists who seemed of the Colossus kind five years back. There is General Ludendorff, who is writing books about himself. How immense and awful seemed Ludendorff in 1917! But now he, a miserable, contemptible thing, is comparable only to the popinjay, his imperial master, who, when near battlefields, had the roof of his temporary dwelling specially fortified, and paled and trembled at the thought of the approach of an enemy aeroplane. Here was a war lord who ordered his people to die for him. Silent now is William; but Ludendorff day by day, as it seems, mangles out his miserable explanations and his protests, throwing the blame for failure on his military associates, on the politicians, on the people, on all, squealing and scratching frantically like a rat in a trap. There was, after all, a certain nobility in the later Hindenburg, but there is none in such Teutonic truck as this. The Historical Perspective shows.

MAN'S WORK.

CHAPTER VIII.—*continued.*

V.

SPENCER MARTIN arrived at Romano's at a quarter before the hour. He would watch the Sitwells, and come to a final conclusion before they saw him and assumed the guise of hosts; from which it will be observed that he was a man of considerable perception. They had been waiting for him in the lounge for perhaps ten minutes when he emerged from an adjoining room. Claudia, looking up, saw the ponderous figure—the dusky red face, the small gimlet eyes, the enormous paunch, encased in spotless clothes and a shirt on which gleamed pearls as large as marbles, and put him down as one of those products of the metropolis which one had read of, but never seen. She wondered if, perhaps, he was the Pearl Bill Higgins whose photograph sometimes appeared in Sunday illustrated papers. 'What a man!' she thought. 'What a dreadful man!'

'Claudia, let me introduce Mr Martin.'

She got up as though in a dream, felt the blood climbing to her temples, murmured something unintelligible, and presently found herself at a small, candle-shaded, flower-decked table between the two men. The flowers, the lights, the silver, the women's dresses, the music that drifted from amidst a cluster of palms, were all what she had hoped and anticipated. But this man!

Spencer Martin settled himself comfortably. Romano's was his favourite restaurant. He often entertained here, and they all knew him, from the *maître d'hôtel* down. This party, he reflected with a grin, would be well looked after. His eyes took in Claudia's figure with definite approval. He had heard about these Californian women.

'Fond of New York, Mrs Sitwell?'

'Yes; but I know very little of it.'

'And you won't see much this time,' said her husband apologetically.

'You shouldn't let him make such flying trips,' chuckled the big man. 'Here to-day—gone to-morrow.'

Claudia pulled herself together. It was all like a dream, a breath that played over the surface of something hidden and profound. Then Spencer Martin began to talk, unfolding a sharp, shrewd observation that impressed her deeply. Even in his play she got a glimpse of the strength of the man. It seemed that she and her husband were shuttles that he flung back and forth across the continent.

'You must be a very busy man, Mr Martin,' she ventured.

'I suppose I am—it's my form of amusement—and it agrees with me.' Even as he spoke his red flesh exhaled, as it were, a suggestion of coarse, primal vigour. 'Your husband couldn't stand what I do; but, then, he takes it more seriously than I do. I can see that.'

'Some men have to work harder than others—to live,' put in Sitwell deferentially.

'And a lot of them ask too much to live on. Thing is to make your first million, and let that make the others.' Martin applied himself noisily to his soup. 'What would you do,' he said presently, with a twinkle, 'if some one gave you a million?'

Claudia laughed in spite of herself. 'It's beyond my dreams.'

'Why should it be?' he answered quietly. 'I've made one, and seen one made, over night.'

She did not answer, but regarded him with something like awe. Sitwell's face, too, was introspective. Suddenly she caught the eyes of Spencer Martin. They were fastened on her, brows pulled down, with a stare that seemed to bore through her very clothing. It was a ruthless look that ripped away all her defences, and left her in a strange way unprotected. Then his eyes shifted and were bent on Sitwell.

'It's a darn shame shooting you across to California when you're just off the train. Why not let Hunt go alone, and stay here and see a bit of life? I'll show you New York as it ought to be shown.'

Sitwell felt a surge of triumph invade every fibre of his body. 'That sounds good to me.'

'You can stay at my place out in Westchester,

and spend every day in town. We can do the theatres, and motor home afterwards. I 'm busy most of the days, but my play-time is at night.'

Martin jerked this out as though he wanted to get rid of it, but all the time his small eyes were glancing first at Claudia, then at her husband, in what would have seemed a jocular, careless way had it not been for the little points of light that had suddenly kindled in their gray-green depths. The girl saw them, and was smitten with a nameless fear.

'That 's a pretty good offer, Claudia. Let 's take it—eh?—It won't make any business difference?' Sitwell turned to his guest.

'I 've known such visits mean a considerable aid to business,' came the significant answer. Simultaneously Claudia felt Spencer Martin's foot press firmly on her own. 'Better stay and have a good time, Mrs Sitwell.'

She shivered violently and became bereft of strength. The small eyes still held her fascinated, and Martin's face appeared to grow larger and larger, and, becoming detached from his body, to swim towards her like a hideous mask. Sitwell, too, was looking at her with an expression not to be misunderstood. Martin's proposal had startled and delighted him. The inner circle was open at last. He made a little, secret gesture.

'May I talk it over with my husband?' Her voice sounded small and thin. She was in terror of what might happen, whether she agreed or not.

Martin nodded. Presently his foot was withdrawn. 'We can fix it up to-morrow.' He ate for a while without speaking; then, 'I 'm going down to Pennsylvania in the car in a few days. You 'd better both come along and have a squint at some of my wells. I can put you on to something good in the way of stock before it comes on the market.'

'I 'm afraid my money 's all locked up in option,' said Sitwell regretfully.

'I 'll carry it for you—don't worry. You see, Mrs Sitwell, it 's more than probable that your husband and I will be pretty closely connected before long. We sort of tried each other out to-day,' he added with a laugh.

'Oh!' she ventured uncertainly.

The big man chuckled. 'I can see you don't guess what that would mean to you.' His mood changed, and he talked for a while with Sitwell, flinging out curt sentences that seemed to lag behind his active brain, revealing a mind ruthless, courageous, and fortified by success.

And while he talked Claudia explored every avenue of escape. Whether her husband was blind to Martin's thinly veiled desire for conquest of herself, or whether, seeing it, he deliberately put it aside, she could not tell. She prayed it might not be the latter. Whatever happened, she must leave New York to-morrow. The spider's web was gleaming, and Sitwell was ready to take her by the hand and walk into it.

At ten o'clock Martin proposed going to a cabaret, but she pleaded fatigue after her long journey.

'Never mind; we can do something to-morrow. Get in my car and I 'll take you both home.' He seemed too assured of to-morrow to raise any protest.

As the big motor moved off she looked pale, but very beautiful. Martin, glancing at her sideways, thought her the most desirable woman he had ever seen. His knee moved slightly toward her. He stole a look at her husband, who was dreaming of the future, and smiled inwardly. When they got out, he held the girl's hand in his big, hot palm for an unreasonable time.

'See you to-morrow,' he said a little thickly.

She did not speak, and Sitwell looked at her, puzzled. He had been listening to the lisp of the tires against the smooth asphalt as the car sped up the great, brilliantly lighted avenue, and his thoughts were of days that would obliterate the petty anxieties of the past. Once in their room again, his tongue became unloosed.

'Why didn't you say good-bye to Mr Martin?'

'I loathe him!'

He stared in sincere amazement. 'What 's the matter with you?'

'Everything, and nothing. I 'm going west to-morrow.'

He shook his head. 'We 're staying here for a week, Claudia. You 're not a fool?'

'I 'm a woman with a little self-respect left. You can enjoy Mr Martin's society without me.'

But Sitwell was vividly aware that it was not his own society which prompted Martin's hospitality.

'You misunderstand him altogether. He 's rough, and, perhaps, a bit vulgar, and——'

'I 'm glad you are aware of that.'

'But he 's good-hearted, and intends well for us. Have you the faintest idea what all this means?'

She surveyed him with eyes of utter scorn. 'I know what he intends—for me. And you, my husband, stand by and smile. You can stay with him if you like. I go back to-morrow.'

Sitwell shook his head. 'You propose to upset a fortune by a bit of foolishness! You 'll do nothing of the kind.'

'And my first duty will be, as a shareholder of the Enterprise Company, to ask an inquiry into their affairs,' she went on steadily, there being nothing left in her heart now except shame and hot resentment.

He began to think furiously, for this was the one thing he could not afford—yet. A new Claudia faced him, her whole soul in her indignant eyes. Then something like fear took hold of him. 'I don't want you to be uncomfort-

able. You misinterpret Martin altogether. It 's only because you 're not used to the life here. If you insist on going back to-morrow, we 'll go. I 'll see him in the morning.'

She looked at him strangely, as though suddenly she saw him for the first time in natural colours—false, calculating, without pride in that which demands pride, ready to barter the shreds of his reputation for the prospects of wealth, a stranger to honest effort, a semblance of manhood in well-cut clothes—this was her husband.

They left next day. Just what Sitwell said to Martin he did not reveal, but Claudia suspected that on her shoulders had been put the responsibility. She was secretly glad of this. If her husband had said anything which might divert Martin's attention from herself, it was the best thing that could happen. She was ready to be called either a fool or a prude, if only her face was set away from that loathful visage.

At the station the engineer met them, and was introduced. As Sitwell spoke his name she looked at him with a swift sense of remembrance. 'Is this the Mr Hunt who is engaged to Miss Winter?'

He smiled broadly. 'How on earth do you know?'

'I met your fiancée in the west. She——'

Sitwell pressed her arm warningly. He was a little breathless. He did not understand anything, except that in the next moment the Enterprise matter would come to the surface.

'We met Miss Winter and her mother in Los Angeles a few weeks ago,' he broke in. 'Now let us find our seats; there 'll be lots of time to talk.'

Hunt nodded and picked up his bag.

'Not a word of the Enterprise,' Claudia heard a sharp whisper close to her ear. 'If there is—I 'm down and out.'

(*Continued on page 215*).

MURMANSK AND THE MURMAN COAST.

By G. Arvey.

ALTHOUGH situated well within the Arctic Circle, Murmansk is accessible for merchant-vessels throughout the year. This does not by any means signify that the waters of Kola Inlet, on which it stands, are never frozen over; but the ice that does form is of such thickness that ordinary steamships can negotiate it without difficulty. On the other hand, for six months of the year it is impossible for them to enter or leave the White Sea ports farther south without the assistance of powerful ice-breakers. Kola Inlet is the drowned valley of the combined Kola and Tuloma Rivers, and is about forty miles in length. It runs generally north and south, but half-way up there is a short east-to-west stretch, completely protecting the upper reaches from the ocean. Numerous lesser fiords branch off on either side. On one of the western ones, close to the mouth, stands Alexandrovsk, connected with both Peterhead and Archangel by a submarine cable laid during the war. Murmansk is built on the eastern shore, three-quarters of the way from the entrance. Although the harbour is deep and well protected from both sea and wind, Murmansk can scarcely be described as an ideal port. A strong current runs at all times, whilst the narrow inlet is tortuous and badly charted. It is studded with rocky islands, some of which are believed to be either rising or sinking. Further, the high latitude occasions severe magnetic disturbances, which render navigation and wireless communication difficult. The sun does not appear above the horizon throughout December and part of January, and the cold is intense. To make matters still worse, the prevailing westerly winds bring thick fogs, which remain for days and weeks before a breeze springs up from some other direction to clear them. When the surface of the water is not covered with a thin sheet of ice, great chunks are swept down by the rivers. Communication between ships and the shore is practically impossible while these conditions last. Means of communication between Murmansk and the interior are long and precarious. However, the local conditions are capable of much improvement, and, apart from the Black Sea, Murmansk is present-day Russia's only winter port. It possesses the great advantage over both Petrograd and Odessa of opening directly on to the ocean instead of on to an inland sea.

Although no attempt was made to develop Kola Inlet commercially until 1914, its importance had been recognised, and the formation of a naval base considered some years before. At one time it was practically decided to establish one on Kildin Island, just to the westward of the entrance. Between the island and the mainland is an excellent roadstead where vessels may anchor when prevented by fog from entering the inlet. The need for a port accessible to British and United States ships all the year round became imperative with the outbreak of war with Germany. Murmansk was founded under the name of Romanov, which remained until the overthrow of the dynasty in 1917. Before the new port attained any real value, however, it was essential to build a railway six hundred miles long through desert country in order to connect it with the capital and the main Russian railroad system. The physical difficulties were immense. It had to be carried through virgin forest, over fever-infested swamps, and across deep gorges. Although

its construction had been contemplated before the war, the enormous cost, together with the question of labour, rendered it prohibitive. But the war solved all this. Money became of little account, and Austrian and German prisoners provided the necessary labour. The work was begun from both ends in 1915, and the central section along the shore of the White Sea was barely completed at the time of the Revolution. American rolling-stock was put on the rails at the northern terminus. The construction was pushed forward with all the resources of the Allied Powers, and—like most railway work in Russia—with total disregard of human life. The track is, of course, single, and the bridges are of timber cut at the side of the line. The locomotives burn wood fuel. The line is very roughly laid, and it is not until the ground is frozen hard that really heavy traffic can be taken. The actual terminus is at Murmansk, but a branch line runs along the other shore of the inlet, so that vessels can load and unload on either side.

A British battleship—first the *Jupiter*, later the *Albemarle*, and after 1916 the *Glory*—was stationed at Murmansk throughout the war. In 1917, on the night of the first Russian Revolution, a disastrous fire broke out in a British store-ship alongside the wharf, threatening the town with destruction. The quay was stacked high with munitions of war for the Russian armies, and the town was saved only by sinking the ship. The thickness of the Murmansk fog is illustrated by the fact that on this occasion, although flames were leaping high above the burning vessel's masts, the *Glory*, only two or three hundred yards away, was unaware of what was happening until she received a wireless call. An hour then elapsed before one of her boats could reach the shore to render assistance. During the following winter the Bolshevists were in possession of the town, but the *Glory* remained in the harbour. A British expeditionary force landed in the spring, and a local White Government was set up. In October 1919 the British evacuated the country, and the White Government fell a few months later, leaving the Bolshevists in undisputed possession of north Russia.

The town is surrounded by hills, which render the winter days even shorter than the latitude alone would justify. A wireless station has been erected on the top of one of these. Murmansk is just inside the northern limit of trees, and where protected from the wind the slopes are covered with lovely pine-forests. Elsewhere nothing is in sight but bare, rugged rocks. Under the hot sun of the twenty-four hour July day the inner reaches of the inlet appear as though they were but newly created. The virgin green woods are thick with undergrowth, the air is humming with insect life, whilst countless duck and other wild-fowl skim over the water. At this season of the year mosquitoes are a curse. They breed in the impassable marshes. They find their way everywhere and permeate everything. Unfortunately, too, they seem to scorn the natives of the place, and exhibit a partiality for Westerners. At the head of the inlet stands Kola village, quite ancient compared with Murmansk. Should one propose walking from the one place to the other during the summer months (not a proceeding to be recommended!), there is no alternative to following the railway track. Prior to the foundation of Alexandrovsk and Murmansk, Kola was the only permanent settlement on the Murman coast. In the early stages of the Crimean War it was shelled by a British squadron, as a house yet standing bears testimony.

The town of Murmansk consists mainly of wooden wharves and railway sidings. No attempt has been made at town-planning, the houses having been set quite haphazardly in clearings. The buildings are of timber, and, with few exceptions, are all one-storeyed. Pavements are non-existent, but raised duck-board platforms have been laid across the most marshy spots. A large proportion of the population lives in wagons on the railway sidings. The place of shops is filled by a few wretched stores.

One of the features of Murmansk is the extraordinary diversity of races, suggestive of a mining community on a newly discovered goldfield in Alaska or Western Australia. The sweepings of humanity from eastern Europe, Siberia, central Asia, and the Far East seem to be collected there. The officials are Russians, the store-owners Japanese or Jews, the railway and wharf-side workers Poles, Serbs, Chinese, Koreans, Siberians, Tatars, &c.

The Murman coast, extending from the Norwegian frontier along the Kola Peninsula to the Gorla (the entrance to the White Sea), is among the most desolate and hopeless in the world. To the west of Kola Inlet is Petchenga, recently ceded by the Bolshevists to Finland. Petchenga, on the fiord of the same name, is a tiny village with possibilities as a port; but beyond Petchenga and Murmansk there is simply nothing along that three-hundred-mile stretch of coast-line. It runs for mile after mile without a break, ever in the same south-easterly direction. Inhospitable cliffs rear themselves all the way along, steadily decreasing in height towards the mouth of the Ponoi River at the White Sea entrance. Here and there they appear to have collapsed, giving the impression of a gigantic slag-heap. Inland is one vast plateau, without a vestige of vegetation. Lighthouses, connected by telegraph with Archangel and Murmansk, have been established at several points, and there are a few stone houses inhabited by Lapps during the short summer. Summer, too, brings a cod and herring fishing fleet from Archangel, Kem, and other White Sea ports. From November to May the sea freezes all along this coast to within a few miles of Kola Inlet. Seals found on the ice bring a few Russian sealing-steamers.

THE LAST POST.

By A. A. Methley, F.R.G.S.

I.

WHEN the summer holidays came, Harold Dobson decided, after mature consideration, to go for one of the personally conducted 'battlefields' tours advertised in the daily papers. It would be interesting and instructive to have an opportunity of studying for himself, and on the spot, the tactics, problems, and blunders of the Great War.

Dobson had not taken any active part in the war while it was in progress, having unfortunately been incapacitated by varicose veins, hammer toes, cold feet, or some such minor disability; moreover, as an assistant-master in a small provincial school, his work might justly be classed as of national importance. He was a morose, self-opinionated man, who generally had a grievance of some sort or another, and was not averse to airing it. He wore spectacles and crimson neck-ties, admired Bernard Shaw, despised soldiers, criticised the Government—any Government—and disbelieved, on principle, in such things as patriotism, German atrocities, and the hardships of trench warfare.

The expedition, which took place in August, was not an unqualified success, so far as Dobson was concerned, and he often wished that, instead of undertaking it, he had chosen a visit to the English lakes, or a trip to lovely Lucerne. In France the roads were dusty, the hotels were crowded, and the prices of everything were absolutely prohibitive. He soon tired of devastated areas, which, he was disappointed to find, after the lapse of three years, were not always so completely devastated as he had anticipated; while shattered cathedrals, cemeteries, and such memorable names as Vimy, Arras, and Ypres left him cold and unimpressed.

The company, too, in the 'conducted party' was not to the schoolmaster's taste. There was a one-armed ex-officer, who struck him as being insufferably conceited and argumentative; a pretty war-widow, come with her second husband to visit the grave of her first; an elderly couple, whose only son had been killed on the Somme; and several enthusiastic and aggressive Americans. These people were all uncongenial and uninteresting, so when Le Cateau was reached—for the journey was an extensive and expensive one—Dobson decided to sacrifice the remainder of his ticket, and go for a short walking tour on his own account.

He packed a knapsack, therefore, ascertained that his passport was in order, and set off early one morning, without saying good-bye to any of his fellow-travellers.

II.

That same evening a small, old-fashioned town was reached, where there was a decent inn, and, apparently, no English or American tourist. The schoolmaster felt quite satisfied with himself and with his surroundings. After a good dinner and an excellent cup of coffee, he lit his pipe and strolled out for a breath of fresh air before turning in.

The town—really it was only a large village—was set among thick woods. Dobson struck northward along a wide, tree-shaded road, and as he walked he considered his plans for the next day, wondered whether the sheets at the inn would be properly aired, and meditated on the probabilities of being able to obtain eggs and bacon for breakfast.

He did not think about the late war at all. There was, indeed, nothing to remind him of it in this peaceful country, across which the successive tides of retreat and invasion had swept swiftly and comparatively harmlessly. The devastated regions through which he had travelled so recently seemed unreal and remote.

It was quiet and restful there in the forest, and Dobson wandered on and on without troubling himself about the time. When, at last, he stopped, and looked at his watch by the light of a small electric torch that he always carried in his pocket, he was amazed to find that the hands pointed to half-past nine. He remembered then that he had ordered a glass of hot milk to be ready for him in his bedroom at ten o'clock. If he were to be ready for the milk, it would be necessary to take a short cut back to the town. He turned his torch from one side of the road to the other, peering round with short-sighted, blinking eyes. After a few moments, having found what he wanted, he plunged into a narrow pathway that slanted sideways through the tangled undergrowth.

It was very dark now, for the trees were close-set, and heavy clouds had gathered overhead. There was a strange sense of oppression, of foreboding, in the air. Every now and then a low mutter of thunder—that might almost have been the sound of distant guns—could be heard.

Dobson hurried on, but after a while the path seemed to lose itself among the bushes—or he lost it, which came to much the same thing. He retraced his steps, blundered against a heap of stones, turned sharply, pushing his way through a dense tangle of bramble and bracken fern, and then came to a standstill in what seemed to be a disused and deserted quarry. He groped about blindly for a minute or two,

and, once more, felt in his pocket for the electric torch. As its shaft of vivid light swept athwart the open space, he saw, with a start of surprise, that he was not alone.

A man was seated on a low rock in the middle of the quarry—a soldier, in muddy khaki, and with dark stains on his ragged tunic. His boots were broken and caked thickly with mud. There was a filthy bandage tied across his forehead under a battered cap. He looked as if he had not washed or shaved or slept for a month.

Dobson was very much surprised at the presence of the soldier in that lonely spot—he had not realised that there were still British troops in the country. However, it did not occur to him either to approach the man or to question him.

He simply stood still, the torch in his hand, watching the woebegone, scarecrow figure that crouched low, as if utterly exhausted, over the feeble flicker of a small fire.

III.

The heavy clouds had broken by this time, and there was a pale gleam of moonlight. The white, encircling cliff-walls of the quarry could be plainly seen. Here and there they were broken by dark, cave-like holes.

After a few minutes the soldier roused himself, and, moving stiffly, kicked the smouldering embers into a blaze. Then he pulled a wallet out of his pocket, produced from it a pencil and a sheet of paper, and began to write.

He took a long time over the job, for his head kept jerking forward; it was evidently only with a great effort that he could keep awake. Once or twice he stopped, frowned, and sucked his pencil, as if he were fumbling in his wearied mind for a word or a letter.

When he had finished he folded the paper, replaced it in the case, and thrusting his hand into his pocket again, got out a pipe and a tobacco-pouch.

There was nothing in that pouch—not a shred of tobacco; and Dobson, although an unemotional man as a rule, was suddenly conscious of an overwhelming feeling of pity and sympathy—almost of remorse. He held his breath, and a choking lump rose in his throat as the soldier's dirty, clumsy fingers searched every corner of the shabby little bag, and then turned it inside-out.

At last the pathos and misery of it all became unbearable, and the onlooker, dragging his own pouch from his pocket, stepped forward. 'Here, my man, take what you want,' he said, his voice sounding strangely loud and unnatural in that desolate place, as if it were breaking the dead, solemn silence of years. While he was still speaking the little electric torch went out. The firelight and the moonlight seemed to go out too.

It was very dark there in the quarry—and cold. Once more the thunder muttered in the distance. Dobson shivered, and turning sharply, stumbled back to the path with a sense of chill and helplessness and hopelessness at his heart.

IV.

The next day was hot and sunny, a typical summer's day; and, as he sat over his breakfast in the shady inn garden, where hollyhocks and late roses were in bloom, the schoolmaster felt thoroughly ashamed of his foolish qualms and tremors. He determined to revisit the scene of his curious experience before setting out on the day's march. As his pipe was missing—he must have dropped it when he pulled the tobacco-pouch out of his pocket—an excuse for the deviation from his previously decided route was ready to hand. He detested mysteries, but it is always wise to get to the bottom of one without delay.

It was not easy to find the quarry; the distance was greater and the path more overgrown than he remembered; but at last his search was successful. He found the pipe lying on the spot where he had been standing when he watched the soldier. There were his own footprints—but only his—on the soft soil.

The place itself looked much the same—a dreary, lonely spot, even in broad daylight. There was a hot scent of thyme on the still air. Except for the ceaseless drone of innumerable insects, it was as silent as the grave.

In the middle of the open space were loose stones, and some of them were piled together and blackened with fire. Near by were wet fragments of charred wood. It looked as if there had once been a picnic-party here, or as if some one had bivouacked in the quarry, years—perhaps seven years?—ago.

There was no sign anywhere of the solitary British soldier who had sat over his smouldering fire on the previous evening.

'He must have cleared out early this morning. A deserter from the Rhine army, I suppose,' Dobson said to himself; but he did not feel satisfied with his own explanation.

He looked round the quarry, strangely reluctant to leave, although, at the same time, eager to be gone, and then noticed again the cave-holes that he had seen the night before. Going closer to one of them, he perceived, with a little shudder of apprehension, that a foot, or at least a boot, was sticking out from beneath the tangle of creeper and bramble that curtained the low opening.

It looked as if some one had crawled into the hollow to sleep, or to die—and that was exactly what had happened.

He was lying there on the ground—what was left of him—a man in khaki, and he must have been dead for years. A rusty, dusty rifle lay at his side, and around were the scattered remnants of a soldier's equipment. Dobson had his elec-

tric torch with him (he had put in a refill that morning before leaving the inn), but he did not stop long in the cave. When he came out again, pale and rather breathless, into the brilliant August sunshine, he brought with him a blackened identity-disc and a stained leather wallet.

He sat down on one of the large smoke-marked stones in the middle of the quarry, and read the letter which the wallet contained.

It was not by any means an easy missive to decipher, for the paper was badly discoloured; the handwriting was uncouth and illiterate, and many of the words were strangely misspelt.

The schoolmaster frowned as he read the almost illegible page:

'DERE JANE,—I ope as this finds you in the pink as it leaves me. We as ad a busy time i can tell you since i rote larst and we got it in the nek on sunday at a place wot they calls Mons. But we isnt beat yet not arf and we means to give them blinkin germans a bit of there own back befor weve done with em. No more at present from your lovin usband, BILL.'

There were several rows of criss-cross kisses after the signature, and at the top of the paper a date. It was 26th of August 1914.

Dobson sat for a long time there in the hot sunshine, with the scattered ashes of a long-dead fire round his feet, and with the bees humming drowsily over the wild thyme. Then he carefully folded the soiled scribbled paper and put it back into the mouldering wallet.

'This letter must be delivered,' he said to himself.

TENSIONS.

By BART KENNEDY.

OUR good old friend man is apt to feel that everything will be settled—or, at least, be put on the track for being settled—during the particular time in which he is adorning this earth with his presence. He feels that this time, in which he is breathing the good live air, is the time of times. Never was there a time like it. The time fifty years ago, when compared with it, was nothing. And the time five hundred years ago was in the same box. And the time five thousand years ago was likewise in the same box.

It is all very well—it is all very right and proper for man to feel that the time during which he is ornamenting the surroundings with his presence is It as far as time is concerned. But when he thinks that this time is different from any other time, as far as the settling up of things generally is concerned, he thinks the thing that is wrong. His mind goes down the wrong turning.

The present time is reckoned to be the most stupendous of all times because of the things that have happened therein. Never has there been such a time of crisis! Compared with it all the other past and gone times were mere flea-bites. Never has there been such tension!

But the cold, icy, and congealed truth of the matter is, that, grave though the present tension is, the tension before that was just as grave—that is, to the people who had to endure it. And the tension before that was much the same. And the tension before that. And that. And that again.

Hundreds of years ago there was a tremendous tension in the affairs of man. Indeed, there was a like tension many, many moons before the Year One. And long, long even before that. There were tremendous tensions in the affairs of the men who lived in the civilisations the very names of which are now lost. And during these tensions men felt that everything was on the point of being settled—or soon would be settled—even as the men of to-day feel that the affairs local to this time will be settled.

But, as we all know, the tensions of the past were never settled in the sense that men thought they would be settled. They merely resolved themselves into other tensions, even as the tension of the present time is resolving itself now.

It has always been thus from the time of the most remote and profound past.

This was knocked down, and that was set up! One tyranny was exchanged for another. Heroes came and conquered—and passed into the dust—and in the end it almost appeared as if they had never been.

Men rose to guide their fellows to peace and happiness—men who were to resolve these tensions harmoniously. But the men passed, and the tensions remained, guised in other forms.

There has always been a struggling and a killing and a shouting and a proclaiming in this world of ours. There has always been the time when the goal is in sight! There has always been the struggle to grasp—to grasp what no one really ever knew. Through the thing we call time men have been coming and going with nostrums as to how to grasp this will-o'-the-wisp. Some of these men have been wise and good. Some of them have been foolish. Some of them have been evil.

Nostrums have come and gone—and come and gone—and come and gone again. But they have had little effect. The tension has never been really relaxed. Nothing has ever been

really settled. On the way to be settled, of course! The thing has always been about to be accomplished.

And man has always thought that the tension he endured was the gravest of all. The time in which he lived has been the greatest and the most significant that has ever passed. Man thought thus even when he lived in the dread depths of the primeval forest. That time was the time of times, even as this present time is the time of times. That time all but held the solution of terrible problems, even as does this time. Man was about to grasp the secret, even as he is about to grasp it now.

The whole business has been a kind of merry-go-round, with the merriment severely excluded—if one may be allowed the use of a bull. Man has passed from tension to tension. He has passed from one to the other till, in the end, he returned to the original tension. And then he has started all over again. He has been doing this from time immemorial. Indeed, he was doing it even before he invented the abstraction, Time. He was always trying to settle something or another. Or he was living in hopes that it would be settled. He has always been waiting for the calm, nice, easy, peaceful day to turn up. The day when everything would be lovely. The day when everything would be all right. The day when his brother-man would be sweetly reasonable.

Our dear, good old friend man! It is sad to think that he has been kept in a state of worriment and tension ever since the day he made his first appearance upon the map. For he isn't a bad fellow when you know him. Of course, you have to keep your weather-eye upon him. But that is neither here nor there. When you get to know him, you will find him the most interesting person it is possible to imagine. He is at once as innocent as a lamb and as ferocious as a tiger. He is at once as clever as paint and as dull as ditch-water. At times he would take your head off. At times he would give you the last stiver he has in his pocket. He is a mixed-up kind of a wildly interesting proposition. What he knows about himself is less than nothing. But he is there right enough. There on the map.

And as for his being in a state of tension—why, it is necessary for him. It keeps him going.

KUTZMANN THE COURIER.

PART II.

V.

CONSCIENCE makes cowards of us all. The moment which Kutzmann dreaded above anything on this earth had come at last. How much did the police know? he asked himself in frantic terror when left in a cell for the night. Had they caught Luise Schmidt? What had she told them? Who could have given him away? Would his captors believe his story of being an American commercial traveller? And why did they not ask him about his passport then and there, instead of keeping him in a prison-cell for the night? Did the English shoot their spies? Too well did he know that the penalty for espionage in war-time was death. Would they let him off if he told them anything, or everything? It did not matter, for he would certainly be kept in prison for a great many years.

Morning found him in more confident mood. Quite possibly the English knew nothing of the letter he had written to Holland, and were merely going to deal with him for having a forged passport. That could not be such a very serious matter, surely. 'I will tell them that I am a genuine commercial traveller,' he said to himself. 'They cannot learn the truth unless Luise Schmidt gives me away.'

By the time he had been taken to the room at Scotland Yard where suspect persons were questioned Kutzmann had made up his mind to adhere to the story which had been concocted for him in Rotterdam. But he was reckoning without his captors.

'What are you doing in England?' asked his interrogator.

'I am trying to buy metal for export to Holland,' was the reply.

'Oh—and have you bought any yet?'

'No,' said Kutzmann; 'I have only been here a week or two. I am making inquiries, and when I can get the metal at the right price I shall advise my employers, who will give me instructions to buy or not.'

'You are an American, Mr Davidson,' said the official questioning him. 'Have you ever been in Germany?'

'Yes, I have made a few business visits there,' said the spy.

'Have you ever done any military service there?' was the next query.

'No, sir. How could I? I am an American subject.'

'Were you born in America?'

'No; I was born in Germany, but my parents took me to America when I was a child. I have since become naturalised there.'

'Attention!' suddenly shouted the interrogator in German.

Kutzmann sprang up from the chair he was occupying and stood smartly to a position of attention.

'Oh, so you have never done any military service,' observed the official sarcastically. 'You seem to know the words of command fairly well. Where did you acquire your knowledge of the German language?'

'My parents taught it to me,' said Kutzmann.

'And have you written to any one connected with the German Secret Service since you have been in England?' continued his remorseless questioner.

'No, sir, indeed I have not. I have only written business letters to my firm in Holland.'

'And do you know that the man you have been writing to is a German spy?'

'It is the first I have heard of it,' replied Kutzmann.

'Are you aware that your passport has been forged?' persisted the official.

'No. My firm arranged that matter for me.'

'Well,' was the reply, 'we do not believe your story. We think you are in this country for the purpose of espionage, and if you are wise you will make up your mind to tell us the real truth. In the meantime you will be detained in custody.'

VI.

It was some weeks later before Kutzmann again faced the interrogating officials at Scotland Yard, and what little courage remained to his fearsome nature had gradually vanished in the terrifying conditions of a prison-cell. He knew, only too well, that the letter from Luise Schmidt which he had not destroyed must have been found among his belongings. But what of the woman? Had she been captured yet; and, if so, had she confessed everything to the police? If that were the case, it would be useless for him to keep up the pretence of being a commercial traveller. Better by far to tell everything, and give the officials the full story of his entanglement with the Secret Service of his country. Of Luise Schmidt he had heard nothing, and he dared not ask his jailers what had happened.

So the time arrived when Kutzmann had once more to face that formidable party of men at Scotland Yard, who seemed to know all about him.

'Well, Mr Davidson,' said his interrogator pleasantly, 'have you decided to give us the truth this time?'

'Yes, sir; I am willing to tell you everything. But, first of all, can you inform me what this means? Does it mean death?'

'I am afraid it is quite impossible for me to say,' was the reply. 'The matter does not rest in my hands.'

'Perhaps I had better tell you everything from the beginning,' said Kutzmann. 'I am indeed an American citizen, although a naturalised one. My mother and my father have lived in Germany all their lives, and I left home a few years ago to try to earn a better living in the States. When the war came I was ordered home as a reservist, but when I came to be medically examined the doctors would not pass me. They said my chest measurement was too small, and transferred me to a reserve. A few weeks later I had a letter from our War Office asking if I was agreeable to act as a courier between Germany and America. I replied that I was, and was ordered to report myself to Colonel Baron von Hauptmann in Antwerp. Against my will, I was told to come to England to carry messages from an agent in this country until such time as they should be ready for me to go to America.'

'And who was this agent?' interrupted his questioner. 'Was it a woman named Luise Schmidt?'

'Yes, sir,' replied Kutzmann.

'Go on,' was the answer.

'Before I go any further, sir, I should like you to understand that this woman——'

'All right, go on with your story. We will see about the woman.'

'Well,' continued Kutzmann, 'I have written only one letter to Holland containing any information, and I am sure it was nothing of any value. I asked Mrs Schmidt to find out something about the Grand Fleet for me. She sent me a letter giving me a little news, and I sent it off to Holland with a few scraps of information which I picked up round about London.'

'Where is Mrs Schmidt now?' asked his interrogator.

'I cannot tell you,' was the reply. 'She lives in rooms at Camden Town, but I don't know if she is there now. In any case, I should like it to be known that it is no fault of hers that the information she sent was forwarded on to Holland. She——'

'That will do,' replied the official. 'We will put our own construction upon Mrs Schmidt's actions.'

. . . . . .

In the golden dawn of an August morning the last scene in this drama of war was played in that historic pile of buildings lying by the side of the Thames, where in centuries past kings and queens, with so many other famous figures, last looked upon the light of day. From the time when he and the woman Schmidt had stood together in the dock at the Old Bailey, Kutzmann had abandoned all hope. To the eternal credit of the man, he had done his utmost to shield his accomplice from the extreme penalty of the law. Probably by doing so he in no way altered the course of his own fate. But that does not debar even a subject of the country he sought to betray from giving full recognition to a spy, a man full of imagination, who could visualise with painful accuracy the scene likely to take place when the dread summons came to take his place before the rifles of his executioners.

THE END.

THE MONTH: SCIENCE AND ARTS.

AN AUTOMATIC DEVICE FOR STOPPING TRAINS.

THE problem of stopping a train automatically at a danger-signal has baffled the efforts of inventors for a good many years, and until recently no device for this purpose has proved reliable enough to justify its adoption. To stop a train running at full speed, it is necessary to put on the brakes and shut off steam on the locomotive, and these operations must be brought about by stationary appliances on the ground, preferably under the control of the signalman and interlocked with the signals. The difficulty so far has been to devise a trustworthy connection between the ground tackle and the apparatus on a locomotive moving, say, at sixty miles an hour. Once this has been achieved, it is easy to do what is required. Lately appliances have been invented by Mr J. J. Daniels which have demonstrated their ability to stop a train automatically at any desired point. The mechanism on the locomotive consists in the first instance of three small rubber-tired wheels, which hang down at the ends of three levers to within $2\frac{1}{2}$ inches of the rail-level. These levers are carried on a short cross spindle, mounted on a frame under the driver's cab. One is in the mid-position between the rails; the other two are $6\frac{1}{2}$ inches on either side of it. Each lever is extended above the spindle and is hinged to a vertical tension-rod, so that normally both lever and rod are in line. Now, if one or other of the rubber-tired wheels be pushed forward or backward, the lever to which it is attached is swung out of the vertical, and the rod hinged to it is pulled down. The upper ends of these rods are themselves hinged to the ends of horizontal levers, and when the rods are pulled down, the horizontal levers operate mechanism which sounds a whistle, puts on the brakes, and turns off steam. It is simply a question, therefore, of providing projections on the ground which will act upon the rubber-tired wheels as the locomotive passes, these projections being always in a position so to act when the signals are at danger. Plain upright projections obviously would not do, as, if the wheels were to crash into such an obstacle at sixty miles an hour, the mechanism would be broken up. What is wanted is a gradual engagement between the rubber wheels and the ground tackle, and this is effected by long steel plates, rising in a convex curve from the rail-level at each end to the requisite height at the middle. These interceptors, as they are called, are fixed to the sleepers in such positions between the rails as to engage with the rubber wheels, which run up them and are pushed back with their levers. At a distant signal the interceptor is in such a position that it is directly beneath one or other of the outer rubber-tired wheels; at the home signal it lies in the middle of the track, vertically beneath the central wheel. As the plates rise in the middle and curve down at each end, the result is the same whichever way the locomotive is proceeding. Similarly, it makes no difference if the locomotive is running tender first, as the tension-rods are pulled down whichever way the levers are pushed. Furthermore, the two outside levers perform the same functions, and move in unison, so that a curved plate at one side only suffices, no matter which end of the locomotive is the front for the time being. The interceptors are hinged near one end, and are so connected with the signals that when the latter are at danger, the former are, as we have seen, in the raised position, and engage with the rubber wheels. When the signal is lowered, however, the interceptors are also lowered, and thus do not come in contact with the rubber-tired wheels. With the distant signal at danger, one or other of the side-wheels operates mechanism which blows a whistle continuously until shut off by the driver, and puts on the brakes partially. Should the home signal also be at danger, the brakes are put full on, and the steam is shut off by the middle wheel. After the apparatus on the engine has performed its functions it is reset by the driver. In addition to the movable interceptors worked by the signals, fixed plates are also provided, these engaging the outside wheels just enough to blow the whistle, whereby the driver is notified that he has passed a signal. The apparatus throughout is of a simple and robust character. Finally, it is of a type which can be kept in order by the ordinary permanent-way staff who maintain the signalling apparatus. Trials have been carried out on the Great Eastern Railway with satisfactory results.

A SPLIT-PIN REMOVER.

Those of us who are mechanically inclined know how difficult it often is to remove a split-pin. Moreover, even when forced out of the hole, it is not infrequently dropped, and has to be searched for; or it may fall into some inaccessible position where it cannot be recovered without dismantling essential parts of the machine to which it belongs. A device, therefore, which will draw out a split-pin and hold it without risk of escape will be welcomed by every mechanic, whether professional or amateur. There is now obtainable an appliance of this description, which at first glance resembles a pair of pliers. One leg of the pliers is, however, straight, and contains a sliding bar having at the outer end a hook which engages with the hole in the split-pin, and at the inner end a rack. The movable leg, which is kept open by a spring, carries a pawl, which engages with

the rack teeth on the sliding bar, the other end of this pawl being pivoted on the moving leg. Consequently, when the pliers are squeezed and released two or three times in succession, the effect is to force the sliding bar inward, and to draw with it the hook holding the split-pin. A slotted nose on the moving leg of the pliers fits over the hook after the pin is engaged, and prevents the pin from falling off when it has been extracted. Either the nose on the moving leg or an extension on the fixed one butts against the spindle or the part from which the split-pin is being extracted, and, therefore, takes the thrust due to the pull on the pin as the rack is being worked inwards.

ENLARGING A TUBE RAILWAY.

Most readers of these notes will know that a proposal is on foot for enlarging the tunnels of the City and South London Railway, which runs between Clapham Common and Euston. This was the first tube railway to be built in London, and the tubes are smaller than those of other lines, being only 10 feet 2 inches in diameter. It is proposed to enlarge them to 11 feet 8¼ inches 'in the clear,' an improvement which, allowing for the increased accommodation of the coaches and the higher speeds then permissible, will practically double the carrying capacity of the line. Tunnels of this description are lined throughout with cast-iron. In the tube referred to, each lining ring is in six segments, these being bolted together through inside flanges at the joints. Similar flanges at the ends serve to connect the rings with each other, so as to produce a continuous tube. The most interesting feature of the tunnels is the method of boring them. This is done by what is known as a 'Greathead Shield,' so called from the name of its inventor. It consists of a short tube, slightly larger than the outside of the lining, with one end formed into a cutting edge. A number of hydraulic rams, placed at intervals round the inside of the shield, force it forward through the space occupied by one ring of lining; meantime the loosened earth is being removed from the middle. After the next ring of lining is built up in the rear part of the shield, the shield is pushed forward another ring space. In this way, as the work advances, the ground is always supported by the shield until the lining can be erected, so that the tunnel cannot cave in. Finally cement is run into the space left by the shield between each lining ring and the wall of the tunnel, thus securing the tube firmly in place and preventing any entrance of water. The enlargement of the City and South London tube is to be undertaken in this way, shields being started and worked towards each other from each station. By these means the work will proceed rapidly, and it is not expected to take more than twelve months. The old lining is to be used, with a packing segment at each joint, which will increase the circumference to give the enlarged diameter necessary. Although the trains will be able to run through the shields, the work will be done at night, when about four hours clear of traffic are available. It is expected that two rings of the enlarged tube will be put in every night at each shield, while any disturbance of the rails, electrical connections, &c. will be made good in time for the morning traffic. Ten hydraulic rams are to be used to push forward each shield, their combined force being about four hundred tons.

STEAMED APPLES.

If one were to ask the ordinary housewife how to cook an apple whole, she would answer unhesitatingly, 'Bake it.' There is, however, at least one other way of cooking whole apples in their skins. Instead of heat being applied to the outside and allowed to permeate to the interior, as in baking, the cooking begins at the core and spreads to the skin. Moreover, the heat is provided by steam acting at a constant temperature. The apparatus for cooking apples by this method is exceedingly simple. It is made of tin, and comprises, in the first place, a lower vessel, in which water is placed. Above this, and fitting into the top of it, is another vessel, which is just deep enough to take a large apple. Projecting upward from the bottom of the upper vessel, like so many fingers, are perforated stalks through which the steam escapes from the water in the lower vessel when it is boiled over a stove. The cores are cut out of the apples from the bottom, leaving holes that are just large enough to take the perforated stalks, over which they are placed. A glass lid is fitted on the top of the upper vessel, through which the apples can be observed while cooking. After the water in the lower vessel has been boiling for about fifteen minutes, the apples are done. The results are remarkable. No discoloration takes place; moreover, the skin can be pulled off almost in one piece, and is as thin as tissue-paper. In fact, the original colour is left on the apple after it is skinned, and gives it the appearance of a peach; while the surface is smooth, and the apple is perfectly cooked right through. The appliance is made in eight different sizes, which will cook 4, 5, 7, 8, 10, 11, 17, and 26 apples respectively.

A NOVEL STEERING-GEAR FOR MOTOR-CARS.

New devices which are constantly being brought out demonstrate in no uncertain manner that mechanisms having every appearance of finality are still susceptible of improvement. This has happened recently with the well-known method of operating the steering-gears of motor-cars by a worm or screw on the bottom of the wheel-spindle, which engages with teeth in a quadrant on the rocker-shaft, a lever on which, known as the 'drop arm,' turns the front-wheels.

A rubbing contact is never so good as a rolling movement where motion has to be transmitted, as the former involves friction and wear. When the rubbing contact, such as that between the thread of a worm and the teeth of a quadrant, consists of a line which theoretically has no surface and actually has very little, wear takes place rapidly, and shake, or 'back-lash,' soon develops. In the device we are about to describe, the bottom of the steering-wheel spindle crosses the rocker-shaft as with the usual worm-gear, the two occupying about the same relative positions towards each other. Instead of the quadrant, however, the rocker-shaft is fitted with a stud or spindle passing through it at right angles, and projecting towards the steering-wheel spindle. On this stud is a roller, which, therefore, comes between the rocker-shaft and the steering-wheel spindle. The problem is to rock the stud, and with it the rocker-shaft, to an angle of thirty degrees on each side of the middle position, or sixty degrees altogether—the movement needed to work the steering-gear. This is done by a very curiously shaped cam on the steering-wheel spindle. We will suppose for the moment that the latter is fitted with a cylinder (in place of the worm), having a big groove in the middle, just wide enough to take the roller. If the steering-wheel be turned, the cylinder will rotate; but as the groove is plain, it will have no effect upon the roller. Should the groove be in the form of a spiral, however, the roller will be pushed over as the cylinder is turned, and this is how the problem is solved. But a plain spiral groove would only fit the roller in the middle position. As it rocks in a circular path, off the centre, one side of the roller tips up nearer to the cylinder, and the other turns down away from it; consequently the sides of the groove have to be made to suit. In general form the grooved cylinder or cam resembles an hour-glass with an involute, spiral ridge at each side, the result being that the roller is an exact fit between these ridges in all positions. The motion being a rolling one, this mechanism is almost frictionless, and practically no wear takes place; hence steering is much easier than with the worm and quadrant, and 'back-lash' is entirely eliminated.

A KITCHEN MACHINE FOR KNEADING AND MIXING.

We have long been accustomed to the use of machines for various purposes in the domestic kitchen, but the appliance we are about to describe is capable of performing not only one piece of work, but several operations which are usually carried out by hand. It will knead, mix, mash, or strain, and do each more quickly, effectively, and with less effort than it can be done in the ordinary way. The main parts consist of a trough, and an arm which works therein with a very curious motion. From a rectangular top two sides of the trough curve inwards towards the centre at the bottom, giving a V section with convex outsides and a rounded point. The other two sides are flat and vertical. Over the trough is mounted the mechanism for moving the kneading-arm. This takes the form of two spindles, the upper of which is turned by a handle, while a pinion gears into a wheel on the lower spindle and rotates it at half-speed. The kneading-arm swings on a pin at the outer end of a horizontal lever, the inner end of which fulcrums on a fixed pin. At about the middle of this lever is another pin, from which a small connecting-rod is taken to a crank on the upper spindle. When the handle is turned, therefore, the crank works the horizontal lever up and down, and with it the kneading-arm. A plain up-and-down motion, however, would be very ineffective for kneading or performing the other operations of which this machine is capable; consequently it has to be modified. This is done by extending the kneading-arm above the pin on the lever, and giving it a horizontal motion from a crank on the lower spindle. The combination of up-and-down motion, with a horizontal movement at half-speed, causes the bottom of the kneading-arm to move down one side of the trough, following the curve; upward at a slant; then over and down the other side, and up to the top, to begin over again. There is a cross-piece at the bottom end of the arm, which is at all times parallel with the sides of the trough. For kneading and mixing a tinned-steel arm is used in a tinned-steel trough; but for pressing and straining, a trough of perforated metal is used, together with an arm having a wooden cross-piece, the latter being big enough to touch the sides as it follows down their curves. Both trough and arm can be changed in a few seconds. Among the many operations that this machine will perform are the following: kneading dough; mixing the materials for cakes, pastry, confectionery, or potted meats; mashing potatoes and other vegetables; pressing and straining fruits and vegetables. The machine is made with capacities of from 3 pints to 12 pints for working by hand, and up to 12 gallons for power-driving.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (*a*) a reply post-card, or (*b*) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE VISITOR.

By C. M. A. Oman.

PART I.

I.

I ARRIVED in London late on a March evening in 1918, and although I discovered that it would be possible for me to get the last train down from Paddington to my ultimate destination, I decided to spend the night in town, and travel the next morning. My uncle James had written to me several times while I was in France to tell me of the gem of a house that had taken his antiquarian fancy, and I was anxious to land my motley luggage at a safe base, so I left Paddington again at ten o'clock the next morning, and arrived at Lostminster a little after noon. I saw the spires of the cathedral clear against a gusty March sky, as my train ran past the gasworks on the outskirts of the town, and congratulated myself on the prospect of spending leave in such a peaceful place.

There was a little delay about getting away from the station. I knew the name of my uncle's house—Friar's Entry—but what street or road it was in I had no idea. A gallant inspector, seeing a lady in distress, or perhaps influenced by my uniform, came to my rescue and enlightened the driver of my cab. 'Friar's Entry—that's in a little court off St Frideswide's.' 'Near the "Dolphin and Anchor"?' said my Jehu, brightening. 'Between Skinner's and the bicycle-shop,' supplied a bystander. We drove off.

I had not expected to find Friar's Entry in a cobbled street of low-browed shops of unprepossessing character. All Lostminster was not like this, I knew, for I caught sight of bright windows full of millinery, and flourishing grocers' shops, as we passed the west gate and drove down the High Street. St Frideswide's was one of those areas where it is made a point of honour to walk in the middle of the road and let the traffic look to itself. Children sat on the pavement, a few disconsolate dogs wandered round, and from the yards near came shrill pleasantries and the smell of stale washing. A squalid street: if it were not for Uncle James, I would have called it a slum.

My cab drew up finally opposite a small whitewashed entry. There was a distinct odour of fried fish and old clothes. As I stepped out I saw the name I wanted, 'Friar's Entry,' above an archway leading to a narrow passage.

Inside, a many-gabled house stood back in a cobbled court. I looked up, and saw dark, diamond-paned windows, and a long wooden gallery supported by grotesque carved corbels—a gem certainly, but shining from a dirty finger.

A man, whom I took to be a gardener, was ready to carry my luggage down the court. In the hall my uncle James came to meet me. He had aged very much since I had seen him last, four years before. He was my mother's eldest brother, and had stayed with us frequently, in an unannounced, spasmodic manner, before her death. I had always been supposed to be a crony of his. He used to show me his coins and his engravings, and I took him to see the brasses in our Norfolk churches in return. When I was left parentless, in the first year of the war, he had written most kindly offering me a home. I was twenty-two then, and had lived all my life in the deepest country, so I refused his offer 'for the duration,' and took my first chance of seeing a wider world. After nearly two years in hospital in London, I was sent abroad at five days' notice. My uncle still took sufficient interest in me to send me books from time to time, and I had promised to come to him when I returned to England. The prospect of spending leave in a gem of a house in Lostminster was decidedly more attractive to me than a fortnight at a club or a hotel in London.

My uncle James was good company, in spite of the fact that he had a disconcerting habit of appearing to reflect deeply before he uttered a word or even performed such simple acts as ringing a bell or opening a letter. I believe he was generally reported to say less in a week than any other man did in twenty-four hours. He was delighted with the house—the latest addition to his collection—blind to the slum in which it stood, and apparently gratified to find in me a sincere admirer of his black oak walls, his linenfold panelling, and his overmantels.

My bedroom looked on the courtyard. The bed, I felt sure, was a genuine antique. (It was vain to look for the artificial worm-hole.) There it loomed—vast, canopied, and curtained—horrible to my official hygienic mind. Even at midday I could hear the wind blowing tunes in the chimney and singing up the passage. The walls

 [*All Rights Reserved.*]

were panelled, but painted yellow, and across the ceiling ran one huge black beam.

I unpacked my luggage, and took from it several objects to show my uncle down in the library. A little Battersea enamel patch-box, inscribed 'A Present from Lostminster,' I had picked up in a shop in Calais.

The library was literally covered with books. Books lined the walls, stood in piles on the floor, and, worst of all, they sat on all the chairs. I moved a roll of maps and a mass of papers before I could find a seat on the edge of the writing-table.

'Those are the papers,' said my uncle, without any preface. 'I'm making a book from letters belonging to some of the people of this house. Dull stuff mostly, though—very dull; and there's a pack of cipher ones will give me a lot of trouble.'

'Duller than the Pastons?'

My uncle, with a glass screwed into his eye, was at the congenial task of unframing a miniature to hunt for a signature, but after a few minutes he laid it aside and devoted himself punctiliously to his guest.

Behind the door I was a little surprised to see a map of Northern France and Belgium. I had forgotten that he was an amateur strategist of some distinction, and for an hour after tea-time we stood in front of it—he questioning and informing. I found myself hopelessly inferior as he touched on place after place, dates flew from my confused mind, and the only thing I was able to affirm was that my present hospital at Rouen had been a monastery and had served for the wounded before—in the Franco-Prussian War.

II.

When I went upstairs before dinner I noticed for the first time how starkly inappropriate my uniform glared from the old walls. My room did not look welcoming, although some one had lit the fire and drawn the curtains across the windows. It was warm—close even. In some sinister fashion it seemed to have shrunk in the firelight. I thought I caught a glimpse of a man making up the fire as I came in, and got the impression that some one had just left it. They had tried to do their best for me—a few waxen town flowers stood in an ale-glass on the dressing-table—but I did not feel inclined to linger. I found my unaccustomed place laid opposite my uncle at the gate-leg table in the dining-room.

'Who looks after you here, Uncle James?' I said. 'Is Bland still with you? I haven't seen him yet. At least, he had just left my room as I went up.'

'Oh, not Bland, poor fellow! I lost him just before I moved in here,' said my uncle. 'A woman comes in by the day, and Goodyear works in the garden, and sleeps in the little room over the entry.'

'Yes, I saw him as I arrived. He stared as if I was a monster, and seemed deeply interested in my luggage,' I said.

'Oh, decidedly a character, Goodyear. Fond of the old house too.' He laughed gently, and the slender port-glasses on the table tinkled louder than I should have expected in the shuttered silence of the black room.

'I can understand that. I like the plaster lady on the ceiling. "Ceres," is she? Are there many houses left in Lostminster to be picked up by chance like this?'

'I told you in my letter, didn't I?' he asked. 'It was a stroke of Providence, aided by a little acute observation. I was passing through Lostminster on my way to London, saw the picture of the house and a notice of the sale on an advertisement-board in the station, and ran between trains to take a look at it. I wired an offer, and returned home four days later to discover that Friar's Entry was mine—and for practically a song. "Drains," of course, was my first thought; but no!'

'Just, I suppose, that most people want to live right round the cathedral and don't care for the fried-fish shops?'

'Possibly so, but the shops don't trouble me,' he replied dryly.

I reflected that the hot summer days were yet to come.

'What was it originally? Is there any history?' I asked.

'Plenty, but not very enlightening. You noticed the doorway at the end of the passage—No?—fifteenth century—that's all of the Friars left us. . . . Well, I will take you round and into the garden to-morrow. This house as it now stands was built by a John Wonnacott, and then descended from father to son for four generations. The second fell in the Civil War.'

'On the right side, I hope.'

'Yes, they were noted royalists then; but wait. The third stayed abroad until the Restoration, when he returned in time to settle down, take a wife, and have a son born in this house. He had no luck, though—followed the waning fortunes of James II.; landed with him at Ambleteuse, they say.'

'I was there last week,' I interrupted.

He nodded and went on: 'Died in exile. His son survived the '15, but fell, somewhat tarnished, in a duel on Calais sands. Rather a mysterious affair. There are a lot of letters of his, some in cipher that I haven't come to yet, but there seems no doubt that, although upon the Continent he lived the life of a broken-down Jacobite of good family, he made several surreptitious visits to London as a Hanoverian agent.'

'Spied for both sides perhaps. All the clever ones do that, don't they?' I suggested.

'Possibly. Anyway, he had plenty of enemies, and his death seems to have been remarkably opportune. Nothing definite ever came out. In

one thing I feel a fellow-feeling for him, though. He was apparently devoted to Friar's Entry, and used to ride down into the country and have a look at it when he was over in London at his shady work.'

III.

I was very tired by the time I got up to bed—the change from months of routine to a leisured life, I thought. I had never felt so tired as this in France, although I had often been shaken awake there in the mornings. But to-night a headache oppressed me; the room felt damp, although the flames cast semi-human shapes moving upon the walls. When I came up with my candle I thought there was somebody else in the room, but Mrs Garfitt had gone home hours ago; and when I shut the door, and put my candlestick out of the draught, I saw I was wrong. The room was quite empty. I lay awake, and heard one, two, and three strike; got up and took some aspirin, and fell into a somewhat troubled and confused sleep until morning.

I walked with my uncle in the garden after breakfast, and after lunch went out alone shopping in the town. I came back about four o'clock, and met Goodyear in the entry. I was swinging parcels from my finger, and almost knocked him over in the dark passage. His arms were full of pots, and he stopped to talk with me.

I was about to move on, when he said, 'Miss, there's one thing.' He looked awkward. I waited, expecting to be asked for the fiftieth time to go and discover a missing relative's grave in France. But I was wrong. 'Does Mr James like strangers coming round?'

'Strangers?' I said. 'I shouldn't have thought many found their way in here.'

'There's a gentleman, though,' he said. 'Been here several times; got into the garden once, and was here this evening looking up at the balcony and a-talking to himself.'

'Oh, an archæologist, I expect. Did he look an odd, untidy sort of person? A gentleman, you said.'

'Yes, miss—odd and strange-looking like, but not Mr James's sort. I've went after him twice to speak, but each time he's gone.'

'Shy bird,' I said. 'I'll speak to Mr James, and if the gentleman is interested in the house, I'm sure he'll tell you to bring him in next time you see him.'

'Yes, miss.' Goodyear looked dissatisfied.

I changed into ordinary clothes that night for the first time, and looked with relief in the mirror before I went downstairs to dine.

'I feel less of an alien in your house now,' I said.

'You look younger,' replied my uncle.

'But I am five-and-twenty, and what I know, I know,' I quoted.

He looked surprised. 'As much as that—my youngest sister's child?'

I felt the question of age delicate for both of us, so I changed the subject, and told him about Goodyear's gentleman, who was strange with a strangeness that was not Mr James's sort.

He laughed at that, but moved a little uneasily from further questions.

'I suppose he's keen on old houses, like us,' I said. 'Have you ever seen him, Uncle James? I think I shall ask him to lunch if I find him staring up at me on the balcony some fine day—may I?'

'Yes, do. Speak to him, certainly,' he replied, with a shade of embarrassment in his air.

I went to bed early that night. Aspirin had taken away my headache, but it had also apparently produced another effect on me. I was painfully alive, vibrant to every sound and touch. A barrier was gone with my uniform, and I moved in 'worlds half-realised.' I felt as if some one was in the room with me. Well, that was not extraordinary, I told myself. I had been accustomed to share a room with fellow-nurses for months past. But that was different—smoke, talk, laughter, food—sleep. To-night I felt watched. I sat down with my back to the looking-glass to brush out my hair, and twice caught myself looking up at the mantelpiece, expecting to see somebody standing there looking down at me.

'You're getting nervy,' I said half-aloud to myself, and then wished I had not.

I fell to thinking about France. I thought furiously, keeping my attention fixed. I saw the stars through the open window—they seemed very near. I fell asleep, and dreamt of John Wonnacott being born in this room, and woke with a struggle.

IV.

The next day my summons came. I went out with my uncle in the morning to see the cathedral and the museum. In the close we met the dean and his daughter. They were cordial and pleasant, and although they seemed to know my uncle but slightly, they accepted his invitation to tea with us that afternoon. They talked of the local happenings, kindly questioned me a little about my experiences abroad, and some general comments were made on the news from France—it was March 1918.

After tea Miss Vane and I went out on to the balcony, while my uncle carried the dean off to see the garden wall.

Miss Vane's voice changed. 'How nice for Mr James to have you coming to look after him!' she said.

I felt suddenly selfish. 'It is lonely for him alone, I suppose.'

'Yes, and not only that. Well, you know, don't you, why he got the house—why it was sold?'

I looked at her, but just as she was going to speak a shout from the courtyard interrupted us. It was Goodyear below the balcony.

'Miss—miss—a telegram for you.'

I had been heavy and exhausted all day, as if some responsibility had come upon me.

'Leave cancelled,' I said to Isabel Vane.

'Oh! I was afraid it might be bad news. That means a push of some sort, I suppose?'

'It means the first boat from Folkestone to-morrow morning certainly.'

As I changed back into uniform I felt years away from Friar's Entry. I sang at the thought of work again.

I said good-bye to Uncle James in the hall. 'Six months and I'll be upon you again.' To Goodyear in the court, 'Look after Mr James.'

'I passed the gentleman in the court just as I brought your telegram, miss,' he said. 'I called out to him, but he vanished.'

'I'm vanishing too, now,' I said.

I got the eight o'clock train to London. That night, before I went to bed, I scribbled a line from my club to Isabel Vane at Lostminster deanery, giving her my address in France. I liked her. She might have something to tell me.

v.

It was not until after the Armistice that my thoughts turned seriously towards Friar's Entry again. I had heard from my uncle that his book on the Wonnacotts was progressing, and Isabel Vane had written to me three or four times. My uncle had been to tea with them twice at the deanery, but apparently she had never visited Friar's Entry again. She said nothing of our interrupted conversation, and I answered her letters in the same vein, but we both knew that there was a great deal more to be said.

To tell the truth, I had begun to wonder if I should ever see the place again, and had banished all unanswered inquiries about it from my mind, as one banishes the memory of a past illness.

The post-Armistice depression which was attacking so many touched me for the first time one afternoon in December. My hospital had been one of the first to break up, and I had arrived the day before to fill in a few remaining weeks of contract attached to a hospital in Calais. I looked out from my billet window—I occupied a second-floor back—I saw the grime on the bare trees and the fog closing on endless roofs. Below, a maid sang and clanked plates in the sink.

Nothing could have been more commonplace and unworthy of profound emotion. Yet I began to feel a very real tragedy impending. I went out for a walk alone—down narrow streets crowded with Englishmen, past the docks, where the sunset was tangled in masts and rigging, to the sands—the long sands—Calais sands. My thoughts were all with John Wonnacott, though I resented it. Somewhere about here he had fallen in early morning, I suppose. Was it a duel, after all? Was it from this spot that he had made his weary visits to Friar's Entry? I thought I would rather die anywhere than on these barren flats, to be left lying on the cold ribbed sand as the sea crept nearer. The fog closed down, and I reached home late, to find a batch of English letters waiting for me.

My uncle James had died of influenza, and had left Friar's Entry and all it contained to me. Two other letters were from Isabel Vane, the first telling me of my uncle's illness, the second of his sudden death. The remaining letter was from headquarters. I answered them all the same night, and signed a four months' contract for work in Cologne.

I must have time to reflect on my heritage. But I knew what I should do.

TREASURE-TROVE.

By the Rev. W. C. Mitchell, M.A.

I.

WHEN old Edie Ochiltree, the gaberlunzie, in the search operations at Misticot's grave in St Ruth's ruined chancel, brought to pass the pretended prognostications of Dousterswivel—to that mountebank's no small amazement—by discovering the chest of silver, the pawky bedesman added to the zest of the occasion, and incidentally, as the novelist hints, to the trepidation of the impecunious baronet, Sir Arthur Wardour, by exclaiming, like a Scottish schoolboy when he finds anything, 'Nae halvers and quarters—hale o' mine ain and nane o' my neighbour's.' 'Monkbarns's' assurance, however, that as lord of the manor the treasure was Sir Arthur's, but that he should write about the business to the Exchequer and get a deed of gift, should the Crown make any claim, preserved the rights and the self-respect of the baronet, as the issue showed; while Sir Arthur's rewards and hospitalities to the labourers, at the 'Four Horse-Shoes' tavern, liquidated indebtedness in that direction, though, as the antiquary sagely remarked, it could not secure the silence of a dozen of people. But the old bedesman's (pretended) claim, assumed as part of his design to unmask the German charlatan, reflects the attitude generally adopted by finders of hid treasure, due largely to the autocratic ways of Dogberry and Verges, the official depositaries, which, indeed, have been responsible for sending more treasure to the place that tells no tales—the melting-pot—than all other causes put together. Nothing would secure so well the reporting and the preservation of treasure-trove as the wide publication of the law of finds, as has been done, for example, in the wisely directed propaganda of a

scientific union in the south of England. There, by means of literature and placards, the law of first-finding, and the law of treasure-trove, an exception to the other, are clearly set forth, with examples. Whether a fossil, a crock, a prehistoric boat, an ancient weapon, or other article belongs to the finder depends on a variety of circumstances. The general principle is that where a person has possession of a house or land, with a manifest intention to exercise control over it and the things on it or in it, then if any article is found therein by employee or stranger, the possession of it is, nevertheless, in the owner of the *locus in quo*. Thus a 'dug-out' or prehistoric boat, excavated during operations by a gas-company, was held to belong to the owner of the estate, since their licence to remove and dispose of the excavated earth extended only to the said soil, and not to what was unknown and uncontemplated in it. On the other hand, it was decided, and is good law, that a bundle of notes found on the floor of a shop belonged to the finder and not to the shopkeeper, neither of whom was the actual loser of the money, on the ground that the bundle, having been dropped in the public part of the shop, was never 'within the protection of the house.' At the same time, for the future security of finds made in the earth which do not come within the scope of treasure-trove 'escheit to the Crown,' owners would be well advised to deal as liberally, in the way of reward, as the Treasury does with finders of treasure.

The subject of hid treasure has a perennial interest, alike in tales of Eastern djinns and genii, the romances of a Stevenson or a Henty, and the lurid and gory columns of the *Police Gazette*. And the persistence of legends regarding hoards is in itself an element of proved worth. There is always a grain of truth in every tradition; the proportion may be but an ounce of fact to a pound of fable; the pertinent thing is that there is a deposit of truth. Severe literalists may frown on those pleasing histories, resolving them into the insubstantial pageant of a myth. But as the Fairy said to Silvestre Bonnard in Anatole France's charming tale, 'To know is nothing at all; to imagine is everything. You even doubt whether I exist. Silvestre Bonnard, your warm coat covers the hide of an ass!'

II.

According to the definition enunciated by the union above mentioned, treasure-trove 'consists of gold or silver deposited advertently anywhere without abandonment, the owner being unknown.' This succinct statement of the law leaves little to be desired, being based upon the oft-quoted reference in Coke's *Institutes*: 'Treasure Trove is when any gold or silver in Coin or Plate or Bullyon hath been of ancient time hidden wheresoever it be found whereof no person can prove any property. It doth belong to the King or to some Lord or other by the King's grant or prescription.' The four essential elements of treasure-trove are, therefore, the material, the place, the advertent intention, and untraceable ownership. The law itself, which makes the Treasury the rightful owner of all ownerless and obsolete gold and silver, is really a survival, if not an anachronism, conceived in days when bullion was needed for the coinage. To-day the bullion value even of a discovery like the Traprain hoard is negligible. But from the point of view of antiquarian research—the sifting of evidence, secured (in England) by a coroner's inquest and testimony taken on oath, and the safe but insatiable maw of the British Museum, suspiciously like the swallowing apparatus of certain of the viperine world, *vestigia nulla retrorsum*—the law may well be allowed to stand.

Years ago, as I came through the great glens of Strath Farrar and Strath Glass, the clan-country of those Chisholms and Frasers who, in the ''Forty-five,' gave of their best for Death's dolorous harvest on dark Culloden Moor, I met an aged man. Conversation revealed him to be a person of culture and education, imbued to the finger-tips with the folk-lore and the history of the glen, and willing to impart it to a receptive ear; and under his hospitable roof-tree I heard the following romantic history. In Strath Farrar there is a fine stretch of sporting-ground, known in the Gaelic as 'Corrie Eachaibh,' or 'the Horses' Corrie,' in a dry season springy moss, in wet weather a treacherous bog of unknown depth. Here in the shooting-season sportsmen often come on bones and skulls of horses, with sometimes a stirrup, sometimes the wooden frame of a saddle, extruded from the ground in wet weather. On one occasion a saddle-bag full of hammered seventeenth-century silver coins came to the surface. No one in the glen could explain the mystery of the bones, and the place-name added but little light. Some time before, however, in the south of England, a package of manuscripts had been discovered, which proved to be military despatches relating to Cromwell's operations in Scotland in 1651. In one of these the writer, an officer whom Cromwell had sent with mounted troops to sweep the glen from Loch Maree to Beauly, reported that they had seen only three people in the whole strath, two old men and a woman; 'but,' he added, 'we lost three hundred of our best horse in a morass.' Here was the solution of the mystery; in this case the silver, having been left inadvertently, was not treasure-trove, but simply a find.

A second instance came to my knowledge in a Highland strath, where the tired traveller finds one of those comfortable houses of call so desiderated by the Great Lexicographer. As I took my ease at my inn, mine host, in an expansive mood, related a discovery that had been

made in the neighbourhood. Ploughing some fallow ground, the plough turned up a great leather wallet full of silver coins of the reigns of Elizabeth, James, and Charles I. From a damp-stained manuscript with the treasure, it transpired that the bag had been hidden by one of Montrose's officers, till he could return and retrieve it. Mayhap he met his fate among the claymores at Inverlochy; at all events he never returned to claim the coins, for there they were (as in all likelihood they still are), Elizabeth's haughty face, James's squat countenance, and Charles's peaked beard. This was undoubtedly treasure-trove 'escheit to the Crown.' But there! there are some glens in Scotland where the King's writ runs with difficulty, and where they believe that the King—God bless him—has more to do than to be bothered about a lot of 'old ancient coins!' On another occasion I saw in a house in Strathpeffer a very fine ancient Celtic silver brooch. It had been found in the wall of an old 'clay biggin' on Culloden Moor which was being pulled down. Had the brooch been secreted there by some former inhabitant, or had it been cast away by some berserker fugitive, fleeing for dear life? Who can tell?

III.

In the London Museum at Lancaster House, which is 'something like a museum,' and more entertaining in some ways than the finest cinema show, there is perhaps the most appealing collection, coming under the head of treasure-trove, discovered in modern times. The discovery was made during some internal alterations in a house at the clanging centre of London City, in that Wood Street, Cheapside, where, a century before, Leigh Hunt noted in his 'Town' that there grew a real live tree! At a depth of sixteen feet below the surface there was unearthed a wooden chest containing a hoard of Elizabethan or Jacobean jewellery which must have made the eyes of its twelve discoverers glisten. How those twelve men were able to preserve the secret, absolutely, for the space of two years is incomprehensible except for one obvious *à priori* factor which need not be laboured! At length tidings filtered through to the Treasury, which acted with caution and despatch, for ultimately Mr L. Harcourt secured the collection for the city—probably the valued stock of a city goldsmith of three centuries before. The sum which was handed over in solatium was never divulged, nor were any details given. The city coroner, however, took exception, rightly, to the transaction, so far as it constituted an evasion of his authority and opened the door to abuses. The matter for congratulation, however, is that the collection is intact and unique—rings and tie-pins, necklaces and pendants, to the number of a hundred and fifty, set with emeralds, sapphires, rubies, pearls, and other precious stones in profusion.

A beautifully chased cup and paten of the thirteenth century were unearthed in 1892 near Dolgelly by three miners, and were subsequently sold at Christie's to the late Baron Schröder for seven hundred pounds. After the baron had bought them, however, the Treasury intervened, and claimed them as treasure-trove, with the result that an arrangement was come to, giving him the possession of them for life, their ultimate destination to be the Medieval Art Department in the British Museum. The precious relics, which are said to be worth at least ten thousand pounds, have thus been prevented from being taken out of the country.

An authentic case of similar character occurred at Uckfield, in Sussex, in March 1914, when in 'mudding' an old pond near the parish church the labourers found some ancient silver plate, which, however, they did not recognise as valuable. As it was quite black when discovered, the collection was thrown out in a field, where it lay for some weeks. Eventually a labouring-man picked up one piece and took it home, where a local collector purchased the 'old pot' for a trifle. He sent it to an expert in London, who pronounced it a very valuable specimen of the time of Queen Anne. Local tradition associated the find with a tragedy of a century before, when a butler was murdered by burglars at Downfield Place. A hoard of Elizabethan and early Stuart coins was found in a garden at the Manor Farm, Itchen Abbas, Hants, in May 1914, where a lad of eighteen was digging for the purpose of making a 'water-garden' beside the Itchen. In the operations his pick struck a small earthenware jar, some three feet below the surface, which contained two hundred and thirty-four coins. An inquest was held on them in the following month, when their value was estimated at twenty pounds; they were adjudged to be treasure-trove, and the finder was suitably rewarded. It was surmised that the treasure had been deposited by a Royalist who fought for Charles I. at Cheriton Down in 1644, and was killed in the rout.

An exceptionally high tide on the Suffolk coast in April 1911 resulted in the exposure, at Thorpe, of over a hundred old coins and tokens, on which a coroner's inquest was held. The decision was that, not being treasure-trove, the 'galoonas' should be handed over to the local representative of the Board of Trade, with powers to decide whether they came under the category of wreckage and should go to the finders, or to the lord of the manor, as rightful owner. While two labourers were digging a drain at Fakenham, Norfolk, in January 1911, they discovered two hundred gold nobles. These having been reported and rendered up to the Treasury as treasure-trove, each of the men, Wake and Graver, received a cheque for one hundred and five pounds, with an intimation that when the rest of the coins were sold a

further sum would be paid to them. It is questionable if the navvies who melted down the eight-and-twenty Celtic gold brooches, coeval with the Cadboll specimen in the British Museum, found by them in the course of the construction of the Highland Railway through Sutherlandshire, did half so well by their nefarious and vandalistic deal.

Without reference to the thorny question of the rival claims of Scottish Museum *versus* British Museum, the general merits of the case for the proper protection and exhibition of precious relics have been well put in a letter to the London *Times* of 22nd May 1914, relating to a disputed collection: 'The moral is, that a collector who wishes his labours to yield posthumous harvests should place his collection in an establishment, first, of guaranteed permanence; secondly, one with funds and staff to keep it in order; and last, but not least, where it will be accessible to the greatest number of people seriously interested in the subject.'

MAN'S WORK.

By Alan Sullivan,
Author of *The Passing of Oulibut*, *Blantyre-Alien*, *The Inner Door*, &c.

CHAPTER IX.

I.

THE journey west meant for Claudia four days of unreality, tinged with a sense of irreparable loss. The similarity between Hunt and the man she loved was remarkable, because not only his features but his manner and temperament were constant reminders of what she had lost. Her fortunes turned on this man's report, and her husband could have no influence here. With Hunt beside her in the observation-car, she watched the painted desert flicker past, and realised that for the very first time her future depended on the decision of a supremely honest man.

Hunt himself was very happy. He had wired Edith that at the most he could have but a few minutes with her—but this was better than nothing. He wanted a glimpse of California. He re-read his girl's letter, noting that she had only said that she wanted his advice, and it was no use writing more till he got out there. Had he known it, she was, at the time of writing, conscious that her mother had made a foolish move, one of which he could not approve. The proposed investment was in oil—but he did not know where. Reading the letter, he had wired out urging no action till he could express an opinion, and to this Edith instantly agreed. Then had come her trip to Catalina.

In Claudia's wistfulness Hunt found something that matched his mood. Sitwell, it appeared, had little to say that did not concern the oil industry, and Hunt, for the time being, was putting oil out of his mind. He was confident in his love, happy in his heart, ambitious in his work, and the world looked very good. When the train swung down the long grade from San Bernardino, through gleaming orange-groves, and pulled into the great white station of Los Angeles, he jumped out over a pile of luggage and raced to the barrier. In another minute Edith was in his arms.

'I've only a minute or two, blessed one—the car is waiting to take me out. I'll meet you here ten minutes before the afternoon train. That's the best I can do.'

Her eyes filled with tears of disappointment. 'Jimmy, it won't do. Let me go with you. I've so much to say. Oh!'

Claudia and Sitwell had come up—Claudia with a pink flush in her temples; Sitwell's hat off, his face expressionless. Edith's brows went up in surprise.

'Oh! Is Mr Sitwell with you? I didn't know. Are you going out with him?' She extended a small palm, mustering a smile for Claudia. 'I'm afraid I'm rather excited, with so much happening all at once.'

'I wish we could take you both with us,' put in Sitwell, 'but'—he glanced at Hunt—'this is strictly business.'

Hunt nodded. 'I've a property to inspect and eighty miles to drive before four o'clock.' He turned to Sitwell. 'We go south from here?'

'On the San Diego highway.'

'Look here, Edith, I'm desperately sorry, but we'll make it up some day.' Hunt hooked his arm in hers and started for the street. 'Tell me about yourself quickly. Where's your mother?'

'In Catalina. I rushed over to meet you. Oh, Jimmy, this is too tantalising. Is it Mr Sitwell's property you're going to inspect?'

'Yes—for Mr Spencer Martin.'

'That's funny,' she said reflectively.

'Sitwell doesn't happen to be the man who asked your mother to invest?'

'But he is.'

'Good Lord! And I can't tell you a word about it.'

'What do you mean, Jimmy?'

'Don't you see? I'm reporting on this confidentially for my principal. My mouth is sealed even to you.'

She looked straight into his face, a twinkle in

her gray eyes. 'You can frown or smile, Jimmy, when you get back. That 's all I 'll ask.'

'Temptress! Here 's my car.' He beckoned to Sitwell, and the two sped off.

Edith stared after them, a breathless thought springing in her brain. It was wild—probably ridiculous—but it was worth trying. Claudia was signalling a taxi when the girl touched her arm.

'I 'll see you again before I go back; till then, good-bye.'

The taxi moved off, and Edith ran to a big car waiting for hire across the street. 'The San Diego highway—as fast as you can.'

The driver scented business, nodded, and in another moment was dodging southward through the crowded traffic. Edith huddled herself into a corner of the back-seat, a queer smile on her lips. 'If Jim is acting for his principal, I 'm acting for mine,' she murmured.

II.

The car, clearing the city, increased in speed, the engine-note rising to a rhythmical drone. Marking the pace at which they travelled, the girl nodded contentedly, her eyes fixed on the road. At a turn she saw, a mile ahead, the black body of another motor, moving very fast. She leaned forward and touched the driver's shoulder. 'Do you know that car?'

'Was he waiting for the Sunset Limited?'

'Yes.'

The driver grunted. 'It 's my brother—thinks he has a better bus than this. Want to pass him?'

'No; stay half a mile behind. Stop when he does. I don't want those men to see me—understand?'

'You bet I do. He 's letting her out a bit now. How far do we go?'

'About forty miles.'

The only answer was an additional burst of speed. Farmhouses, orange and lemon trees, bungalows and cattle swam past in a blur. The speedometer crept up to sixty, and stayed there. Edith's heart was in her mouth, but she enjoyed the rapid movement.

Half-an-hour later the Enterprise sign fled by, and, looking westward, she saw the line of derricks crowning the great anticline. So it wasn't the Enterprise, after all. Remembering Claudia's letter, she wasn't surprised, but her imagination was sharply piqued. A moment later the brakes were rammed on and the big car pulled up close to the ditch. A little farther on Sitwell and Hunt climbed over a fence.

'Go on now,' she commanded, 'and drive very slowly.' She huddled down, the brim of her hat tilted over her face. It was prudent—but unnecessary. She saw Hunt at a little distance in conversation with two men, near by a cluster of shanties around a derrick. Sitwell she did not see at all. Presently the three sat down; after which Hunt got up and seemed busy with something in his hand. Edith stopped the car and watched intently. Came another long conversation, and Hunt walked slowly over the width of the ranch north and south, then east and west, and, with a word of farewell, came back to his car. Sitwell got up from where he had been lying in the shade and joined him. Then the car moved up a side-road and climbed the slope of the anticline.

She saw all this, glancing constantly at her watch, for the shadows were beginning to lengthen. At a quarter to three they were still on the anticline, and she grew desperate. At five minutes to three the car nosed downhill, heading for the highway.

'Now,' she panted, 'back to the station. Get there before them, whatever you do.'

The driver grunted, 'Our turn come—eh?' and opened his throttle.

At ten minutes to four she dashed into the dressing-room at the Southern Pacific station. Emerging, it seemed a few seconds later, with hastily tidied hair and a dab of powder on a small nose which felt uncomfortably hot, she placed herself at the barrier. The last hour had been a whirl in which there had been little opportunity to think, but one thing was clear. It was not the Enterprise, after all. She had no guide as to what lay behind this sudden development, but, remembering Claudia's letter, concluded that the Enterprise was to be left to take care of itself, Sitwell having transferred his energies to something more promising. Then she realised that Hunt knew nothing of the Enterprise. But they were both Sitwell's undertakings. Finally the way seemed clear. It was now three minutes to four.

In another sixty seconds Hunt raced up, and slipped his arm round her. 'Engine trouble—lost eight minutes! What rotten luck, girlie! I 'm so disappointed.'

She clung to him. 'Jimmy, don't worry. It can't be helped. When will you be out again?'

'I don't know; it depends on this thing. Edith, you look adorable.'

'Never mind me. I 'm dreadfully in earnest; and in a minute and a half you 'll be gone. You saw Mr Sitwell's property?'

'Yes.'

'Well?'

He looked hard into the gray eyes.

'Are you smiling or frowning?' she demanded.

He did not speak, but slowly a wide grin wreathed his face, revealing the strong white teeth, puckering in little wrinkles, a grin that was whole-hearted, spontaneous, and eloquent.

'Oh, Jimmy, I 'm so glad.'

'Glad of what?' he said teasingly, one eye on the clock.

'If you 're taking this train,' remarked the official at the barrier, 'I 'd take it.'

The girl felt herself enveloped in a pair of muscular young arms, and the next moment Hunt sped up the platform. From the car-step he waved his hand. The grin was still on his face when it lessened in the distance. She stood for a moment deep in thought; then, walking slowly to the street, she signalled her driver, paid him, and waited irresolute.

'Anything else I can do, miss?' He had enjoyed that trip.

'I want to go out there to-morrow morning, but it 's rather expensive.'

'It don't cost so much when I 'm not chasing my brother,' he laughed, attracted by her dainty personality, and therefore naming a moderate price.

She smiled back, and gave the name of her hotel. 'Pick me up there at nine o'clock.'

He touched his hat, and she walked off, tense with a situation on which, she was assured, hung so much of the future. It was now a case of her wits against those of Sitwell, who had at last got hold of something good. She was proud that her fiancé should be sent on an important mission by a man like Spencer Martin, and thrilled with the fragmentary knowledge she had herself acquired. It was a matter of forcing Sitwell to take her money and put it into this new property, instead of the Enterprise. Then she would have the support of Hunt and Spencer Martin. But before she did that she would have a look at the property herself. She smiled at the idea. What did she know about it? And were visitors welcome?

(*Continued on page 229.*)

AN ECHO OF THE MONS RETREAT.

I.

EARLY in November 1918 we received orders to move our headquarters to the town of Le Quesnoy, which had been taken only a few days previously after a miniature siege of about forty-eight hours, resulting in the capture of about eight hundred Germans, including the local commandant.

Without delay I set off to arrange billets, and found the town one of the queerest old places we had seen in that part of France. Though now in France, when built Le Quesnoy was an important town of the Spanish Netherlands, and the two enormous brick and earth walls, and a broad moat surrounding the town, bore testimony to the troublous times of that period.

Even during their final retreat the Germans found time and men enough to leave behind them every kind of booby-trap and delay-action mine, from a bomb in a piano in Cambrai, which blew the hands off a British officer as soon as he started to play, to a huge delay-action mine, which blew up the railway bridge at Caudry, twenty-nine days after the Germans had evacuated the place. Another pleasant little surprise-packet which they left for us in one village took the form of bombs in spring-beds, set to explode as soon as a man lay down.

On learning in Le Quesnoy that the late German commandant was still detained there, I sent for him, in order to find out, if possible, where the delay-action mines had been set in the town: visions of the general's billet going up sky-high any night made me distinctly uneasy.

Very soon the late commandant, a typical Prussian major, in Jäger uniform, his face heavily cut from student duels, and wearing an eyeglass, was marched into the room. I don't think I have ever seen a finer veneered savage, and, to show his complete contempt for me, he spat vigorously on the floor, and stood glaring at me through his eyeglass.

The Prussian denied all knowledge of any mines in Le Quesnoy; so, after my telling him that I would shoot him myself directly the first mine exploded, he was marched off to cool his heels. Within an hour he sent word that he would like to see me. This time he gave me the necessary information, and, with the aid of three 'Pioneer' prisoners, we were able to locate and put out of action five delay-action mines in different parts of the town.

When billeting a French town in the reconquered territory, we usually found that during the German occupation one man had become the leader of the inhabitants, and that if you could get in touch with this man billeting became at once a comparatively easy job. After a few inquiries in Le Quesnoy, the interpreter and I directed our steps to the house of a man called Bécourt, and I don't think that during the whole war I ever met a more interesting or more patriotic Frenchman.

Le Quesnoy was a town of narrow, mean streets, and in one of these we knocked at a small plain door set in a large blank wall, and on being admitted found ourselves inside a palace. Bécourt readily consented to come with us, and in about two hours we had finished our billeting, afterwards returning to Bécourt's house to drink a bottle of wine, which had escaped Fritz's well-known nose for that beverage.

II.

Bécourt told us that when the Germans swept over northern France in 1914 he decided to stick to his home, thinking that by so doing he would be of more use to his town than if he fled to Paris, which he could have done quite easily. Finding that Bécourt could speak their language,

the Germans at once made him responsible for the carrying out of their orders in Le Quesnoy, and at the same time his house was used at frequent intervals by the general commanding the group of armies of that part of the line.

Previous to the war Bécourt had rented the shooting of the Mormal Forest, which lay a few kilometres to the south of the town, and shortly after the German occupation had started one of the forest-keepers brought him word one night that two large parties of British soldiers, one hundred and sixty in all, who had lost their way and been cut off during the Mons retreat, were hiding in the forest, and that they were starving. Bécourt, who appears to have been allowed to go about much as he liked, returned with the keepers to the forest, and told the fugitives that he would arrange to feed them, that the food would be left at a certain place every second or third night, and that on no account were they to show themselves during the day-time.

It was difficult enough to hide such a large number of men, but to feed them for any length of time must have been a Herculean task. However, Bécourt got in touch with the parish priest of Engelfontaine, a village lying on the outskirts of the forest, and between them the two managed not only to hide but to feed these one hundred and sixty British soldiers for over two years.

Of course, they were greatly helped by the French peasants for miles round, who, as time went on, must have nearly starved themselves in order to provide food for the British fugitives; but it was Bécourt and this grand old priest who organised the whole thing, and carried out the transport details themselves. It required an iron nerve to carry on work of this kind for over two years, knowing all the time that detection meant a speedy death.

By great good luck the forest appears to have been famous for good shooting—though when we went there with Bécourt we saw only two hen-pheasants—and, as a result, was put out of bounds to the German troops, and the shooting reserved for the general, who used to stay with Bécourt. Owing to his knowledge of the forest, Bécourt always accompanied the general on his shooting expeditions, and managed to keep him away from the hiding-places of the British, one being in the north and the other in the south half of the forest.

III.

During the second winter this general, who, on the whole, behaved decently to Bécourt, settled to shoot the forest on a certain day for woodcock, during a heavy fall of snow. The evening before the shoot Bécourt happened to be late for dinner, whereupon the general flew into a rage, and, instead of taking him shooting the next day, ordered Bécourt to sweep the snow off the footpaths in the town for ten hours.

On his return the general told Bécourt that he had seen French peasants in the forest, but his men had failed to catch them, and that if any more were seen there they would be shot at sight. Bécourt realised that the general must have seen some of the British fugitives, and that if they were seen again the forest would be searched by troops.

Soon afterwards Bécourt learned that the Germans had strong suspicions that British soldiers were hiding in the neighbourhood, and that several divisions in reserve were shortly to carry out attack manœuvres near Le Quesnoy. He at once guessed that in reality these divisions were going to search the forest, and that the sooner he got his fugitives away the better.

This task seemed to Bécourt an impossibility, but the priest suggested that they should appeal to a certain Belgian princess, notorious as an ardent supporter of the Allies, and this Bécourt managed to do. The princess at once promised her help, and in a short time evolved a successful plan of escape.

At this time some patriotic Belgians, in order to supply the much-needed reinforcements for their army from the occupied part of Belgium, had established a complete system of scout agents throughout the whole country; these agents collected all the young Belgians they could, passed them gradually, and generally at night, towards the Dutch frontier, until they eventually got into Holland, and then by sea to the base of the Belgian Army at Le Havre.

By means of these agents the princess quickly passed the whole of the one hundred and sixty British fugitives from the Mormal Forest by twos and threes, dressed as Belgian peasants, to Edith Cavell in Brussels. From there they passed into Holland in the same way as the young Belgians.

Of the one hundred and sixty only sixteen fell into the hands of the Germans, most of them near the Dutch frontier, where the Huns had special guards to try to prevent any communication between Belgium and Holland. Once in Holland, the fugitives quickly made their way over to England, with the exception of two.

As Bécourt said, the British soldier is a queer fellow. One would have thought that, after having lived for over two years like badgers in the Mormal Forest, they would have been only too thankful to reach home. But no. These two men had grown fond of two French girls in Engelfontaine, and managed to make their way back there from Holland. Of course, they were taken prisoners in a very short time.

IV.

After we had been in Le Quesnoy for some time, Bécourt invited us to shoot in the forest, and though I knew that there would be no game,

I went in order to see the places where our men had hidden for such a long time in the middle of the German Army.

In both cases the hiding-places were cleverly concealed in the midst of thick patches of undergrowth, and the men had made quite good dug-outs with their entrenching-tools, scattering the excavated earth over a large area, so that there was no sign of the usual tell-tale mound. Inside they had made bunks, with mattresses woven out of willow-rods, while there were rough tables and chairs made from the forest wood.

Bécourt told us that towards the middle of the war the food of the German troops on the lines of communication consisted chiefly of turnip marmalade, potato-skin soup, and beech-nut coffee; and though the French peasants were not so badly off, yet it gives one some idea of the tremendous self-denial they must have exercised to be able to put aside enough food to keep one hundred and sixty British soldiers alive for such a length of time.

One can hardly find the right words to express one's admiration for Bécourt and the priest of Engelfontaine, who, during that long time, knew that detection meant instant death. Edith Cavell was an Englishwoman, but these two were Frenchmen, who risked their lives for over two long years to save Englishmen from falling into the hands of the Germans.

We learned from Bécourt that on several occasions both French and British spies were dropped from aeroplanes in the neighbourhood of Le Quesnoy. One very interesting incident of the kind is worth mentioning.

About September 1915, as well as Bécourt could remember (most probably when the French were attacking at Arras), a French officer in uniform was landed close to Le Quesnoy from an aeroplane at dawn one morning with two baskets of pigeons. The main railway to that part of the German front ran past Le Quesnoy, and in some bushes at the top of a cutting this officer took up his position with his pigeons.

Here he remained for forty-eight hours, sending off a pigeon every two hours of the day with a message stating the size and the number of troop-trains for the front which passed during that time; and by this means the French General Staff learned what reinforcements the Germans were bringing up to the Arras front. At the end of the forty-eight hours, just as it was beginning to grow light, the aeroplane took this gallant French officer away safely, not even the empty pigeon-baskets being left behind to tell the tale.

SOME CENTRAL AFRICAN CUSTOMS.

By B. Johnson.

I.

SOME years ago—about fifteen, to be a little more precise—I was crossing from Feira on the Zambesi to Broken Hill in North Rhodesia. On the way I called at a native village, named, as is usual, after the induna. His name, in this instance, was Machado. I needed meat and fat badly, and when the old induna told me that there were a couple of hippo in a pool on the Lunsenfwa River close at hand, I was very pleased to hear it.

I went down to the river early next morning, and (by way of parenthesis) in pushing my way through the scrub on the bank became acquainted for the first time with a creeping plant that grows a bean, some two or three inches in length. These beans are covered with a fine, hairy down, which causes an intolerable irritation to the skin for an hour or so after contact. I was dressed in my usual bush garb—shorts, shirt with sleeves cut off well up the arm, and chest well open—so that all the beans had to give they gave me, 'good and plenty,' as the old sailor would say. I have since heard it called buffalo-bean. The proper botanical name I have never discovered, and the name that I gave it would certainly not bear repetition.

However, I reached the pool, found it walled in on two sides with rock, with an open approach at both ends. I sat there the whole day, but never saw a sign of hippo. The whole surface of the pool was easily visible; had a hippo broken water I could hardly have failed to see it. I was disappointed, and so was the old native. He told me that he would try to make things better for the next day or so. On my inquiring how he proposed to do so, he told me that he knew some evil spirit was angry with him, and that on the morrow he would go and speak to the old chief about it.

This old chief was long since dead, and was buried close at hand. Without actually intruding on the ceremony, I saw and heard what happened. The old chap knelt at the grave-side, placed a little honey and a little meat near the grave, bowed his head, and, as though he was talking to a living person, implored the departed to help them, pointing out that they were hungry; asking also that he would not be angry with them, and that he would overcome the anger of whoever wished them ill. This happened about nine o'clock in the morning; at about four o'clock in the afternoon I went down to the same pool again, and had not waited longer than five minutes, when a bull hippo broke water. He gave an easy shot, as

his head was well out, and was killed instantaneously.

The old native was immensely pleased. I could have pointed out to him that there was an overnight's hippo-spoor leading into the pool, but at the same time thought it would be rather mean to damp the old chap's faith in his gods. I might here remark that one 'success' such as this repays them for a score of disappointments, as when their prayers go unanswered it is always put down to the evil spirits (and native spirits are nearly all evil) being temporarily too strong; also, that the custom of propitiating the 'manes' of the departed is still as strong to-day in Africa as it was two thousand years ago—or ten thousand, for that matter—in ancient Rome and elsewhere. I have found the practice to be common to the scores of different tribes I have met.

While in the same district news was brought to me that a boy had been killed by a lion. It seemed that a lion (or lions) had cleared some villages out of dogs and goats, and had now turned man-eater. I judged the offender to be an old lion, as—this being a tsetse-fly country, there were no cattle—game was by no means scarce. I was not too keen on man-eating lions; however, a decent skin in those days was worth up to ten pounds at the African Lakes stores, or possibly a bit more from an individual who particularly wanted one, and a 'tenner' to me in those days (as it does to-day) meant 'beer and baccy,' not to mention other necessaries. The lion was known to hang out in a thorn-scrub patch of a square mile or so in extent. I asked the induna of the village to give me guides, and I would try to shoot it. He smiled at me, saying that the lion had only taken the young boy to 'grease his throat,' and that if he gave me guides some of them might possibly be killed, or that even I might get hurt, and in that case he might be called to account by the *bwana* at the Government camp, some eighty miles distant. However, I reassured him by pointing out that unless the marauder was finished he would certainly come again, and might possibly get him too, and that if a white man insisted on looking for lions and got killed or hurt, only the white man himself was to blame, and that this was a well-understood white man's custom. I eventually got a shot at the brute in thick scrub—a good shot, too. Unfortunately, I had previously broken the extractor of my old sliding or falling block express, and was forced to use a cleaning-rod to eject the empty case. Before I could get another shot home he bolted into some very thick scrub, and I left him 'to get cold.' I returned the next morning, and found him dead, but still warm—a mangy brute, with broken and worn-out teeth and a hide not worth taking off. As showing (what I have since proved) that the porcupine is not despised as lions' meat, quills of this animal were firmly embedded, but broken off, in the flesh of the chest.

II.

However, customs was what I started to write about, not lions, so here goes. Natives came from all around to have a look at the carcass, and the manner in which they abused it was amusing. It seems to me that a fitting proverb to accompany the saying 'A living dog is better than a dead lion' would be 'A live louse is more to be feared than a dead lion.' The natives held an indaba. The headman came to me and said that it was well known that the lion in question was a malignant human being (a common belief), and that they wished to burn it, but that they were aware that the skin was a great trophy to the white man, and they wished to burn hide and all. If this were not done, they were afraid that some evil-disposed person might become possessed of even a part of it, or some hair, and with that in his possession might bewitch others, or perhaps acquire the power of being able to turn himself into a lion. As a recompense for the loss of the skin, they were quite willing to give me a girl or a boy, as a slave, should I be good enough to agree. Labour was cheap in those days. I pooh-poohed the idea of receiving anything in return (as already mentioned, the skin was worthless), and with a lordly gesture and a few words presented the lion to them, lock, stock, and barrel, thereby cheaply acquiring a reputation for unusual generosity. They promptly burned the carcass to ashes, absolutely believing that they were destroying all trace of a most malignant man-witch.

There is living close to me an old, nearly blind native, Matotela tribe, named Kaliangula, famed far and near as a lion-doctor. He is scarred on the forehead. It is most firmly believed that he has the power of becoming a lion at will, and the scar is pointed out as evidence that he was found (in lion guise) eating a buck. The native who found him threw his spear and wounded him, &c., &c. He is not charged with being a man or cattle killer, and as his medicine is credited with being a protection for man and beast against lions, he has escaped the usual fate of the 'witch,' and, on the contrary, is honoured accordingly. The 'honour' consists of an occasional present of a goat, a piece of calico, or the like. To attempt to laugh the natives out of the above belief is time wasted. Their faith in Kaliangula is great, and obviously sincere.

In 1911 I made a canoe journey up the Kabompo River. The Kabompo is a tributary of the Zambesi, and runs in a southerly direction, to join the Zambesi at the upper end of what is known as the Barotse Valley. There was a well-known rogue hippo on the lower reaches of this river. It was credited (or debited) with having smashed up quite a number of canoes, and with having caused the death of some of the occupants by biting them, and others by drown-

ing. (The river is not more than one hundred yards or so wide, but crocodiles are plentiful.) I was taken to the stretch of river the beast usually frequented, and found a good part of it to run between reed-beds, thus making approach difficult, and affording a fairly safe retreat for the hippo. He had already been shot at many times, and was wary enough to give no great chance of a brain shot. I tried for several days, but with no success. I saw him give an occasional puff, with his snout on a level with the water, but was afraid to risk a shot, always hoping for a better chance.

There was a native in the vicinity with a reputation as a 'shooting-doctor.' I was urged by my natives to give his *muliana* (medicine) a trial. I could not stay much longer on the off-chance of getting the hippo, and the natives were scared of paddling through his 'water right.' It therefore meant a porterage of some five miles or more, which I was anxious to avoid. I thought that I might give the 'boys' confidence by having the 'doctor' brought. I had meanwhile got a 'brain-wave'—one of those simple plans that always leave one thinking, 'What an ass I was not to think of that before!' It was simply to procure an old canoe and let it float empty down-stream. If the hippo acted up to his reputation, he would attack the canoe on sight; and, therefore, I had only to keep pace with the slow current as it carried the canoe down-stream, and wait for him to show.

Before my putting this plan into execution the 'doctor' arrived. I let him doctor me for a start, which doctoring consisted of slightly scratching the skin between trigger-finger and thumb and rubbing in some grease (of what sort I have not the least idea, and, of course, the 'doctor' was not giving away his trade secrets). He also rubbed the natives and the guns with the same stuff. The next morning I sent 'boys' to a village up-river to get an old boat. They sent down to me, some hours later, to say that they had procured what I wanted. In the early afternoon I also went up-river, and launched the old canoe. The scheme worked without a hitch. I walked abreast of the canoe. It sometimes hung up near the banks for a minute or two, but always eventually drifted down. The hippo put his head well out to look at what was coming, and was shot dead at easy range. 'There you are,' was the cry on all hands; 'did we not say so? A great doctor, truly' (referring to the 'gun-doctor'). 'His medicine is real medicine,' &c., &c. That I had anything to do with the business never seemed to enter their heads.*

I called up my 'boss boy' (a native who had been schooled at the mission-school since childhood), as I was curious to hear what he thought on the matter. He was absolutely convinced that I took only a second-rate part in the affair; that whatever credit there was was due to the 'doctor,' and that I was only his 'agent' (which word I use for want of a better). That a simple plan, combined with a dash of luck, had rid the river of a pest never occurred to him. And I wisely left it at that, well knowing how hard superstition dies.

I could quote many more instances of the peculiar (and sometimes terrible) customs which I have come across in Africa, but in doing so might bore the readers of the *Journal*. I will, therefore, conclude by remarking that within a radius of ten miles of where this is written can be found a native gun 'doctor,' a crocodile 'doctor,' a snake 'doctor,' and a 'doctor' who is very often called up to dance the devil and the disease (any disease whatsoever) out of the bodies of the afflicted. There is also a woman with her right hand burnt completely off at the wrist. It was burnt off by her own mother some years ago for a petty theft committed by the unfortunate creature. There is also a woman who threw her own child into the river and drowned it because it cut its top teeth first, and was therefore bewitched. The saying that 'African natives are only children' is very much of a half-truth, and an exceedingly dangerous half-truth to boot.

* I have also remarked, on making a well-aimed or fortunate long-distance shot, that 'the man behind the gun' does not by any means rank with the gun itself; such remarks as, 'Of a truth, a gun, a fine gun,' 'Surely the white man is a god [*mulimo*] to make such things,' being common.

VALE.

HUSHED are the chapel bells—all hushed
The myriad sounds that fill our day;
The 'Last Post's' throbbing, lingering note
Faint o'er the river dies away:
Soft, kindly night, with lulling hands,
Spreads wide her dream-brocaded pall,
And wraps our little world in sleep,
As darkness closes over all.

Framed in my lattice, widely flung
To lure each vagrant summer breeze,
Wafting the garden frankincense,
Whispering blessings on the trees,
Pensive I muse, all unaware
How swiftly flies each quartered hour,
Throbbing upon the drowsy air
In deep-voiced chimes from Lupton's tow'r.

A tardy bee drones slowly by,
Leaving a waning trail of sound;
The crescent moon ascends on high,
Fantastic shadows etch the ground;
All ghostly in the silver light
The dear, familiar buildings rise,
Like gracious spirits beckoning
A pilgrim into Paradise.

Alas! they beckon but in vain,
For dawn shall ring my passing bell:
A swallow flown comes not again;
Old days—old ways—farewell! farewell!

GUY COLIN CAMPBELL.

A FEW NOTES ON SOUTHERN CALIFORNIA.

By P. Roualeyn Gordon.

I.

A STORY is told of a California small boy, who, on being asked if he could tell where it was that Noah landed with his Ark, promptly and confidently replied that 'It was California, of course, because everybody comes to California; besides, there are so many things in California that other places ain't got—big trees and Indians and strange animals and——' Somewhat hazy in his biblical knowledge, this young man, nevertheless, was an enthusiastic Californian—a trifle over-enthusiastic perhaps, although California does possess, in a large degree, many things that other places 'ain't got.'

From the time when Spain, in the height of its glory and in its desire for the choicest lands of the world, first claimed it, California—especially southern California—has always had a wealth of romance attached to it. The famous missions (a line of which skirt the coast from San Diego to San Francisco) founded in the eighteenth century by the Franciscan Fathers still stand in majestic splendour—fitting monuments to the state's earliest pioneers—surrounded by beautiful vineyards and fragrant orange-trees.

It was the discovery of gold that caused the eyes of the world to turn toward this land so richly endowed by Nature; people flocked into the country from all quarters; many rich strikes were made, and the treasure wrung from the mountains and the deserts played a wonderful part in the development of the 'Golden State.' It forged ahead in a remarkable manner, and at the present time occupies a foremost position as one of the wealthiest and most important of the states forming the Union.

One of the chief assets of this highly favoured land—particularly the southern portion—is unquestionably the climate. Within its boundaries one has choice of a wide diversity of climates—a fact many people do not realise. The idea held by a large number of people who have never lived in the state that the whole of California during the summer is a counterpart of the nethermost region is entirely erroneous. In San Francisco, for instance, it is invariably so cool in August that household fires are necessary; while at Indio, in the Coachella Valley, in the same month the thinnest of clothes are too warm for comfort. Los Angeles, on the other hand, occupies a happy position between these two extremes, and this is shared, with slight variations, by the smaller towns for twenty miles around, the climate becoming moister and cooler toward the ocean, and drier and warmer toward the mountains.

The climate in the northern part of the state—taking the average the year round—is much cooler and moister, but more bracing, than it is in the southern portion. In San Francisco, even on the hottest day, the air is tempered by a cool breeze from the ocean, and hardly a day passes but there is some fog, either in the early morning or at night. In the southland the climate verges on the semi-tropical; this becomes more pronounced farther inland. In certain of the small interior valleys are localities where the mercury in the middle of a hot summer day will range up to or above a hundred degrees in the shade.

A recent 'climate bulletin' issued by the Los Angeles Chamber of Commerce gives the average number of days in that city (since 1877) when the mercury climbed above ninety degrees as thirteen days a year, with an average of one day a year when the thermometer registered over a hundred degrees. During the year an average of three hundred and nine days will be found with cloudless skies or when the sun is partly obscured.

The period from November to April—the winter months—is the rainy season. The rainstorms are intermittent in character, seldom lasting for more than two or three days at a time, with frequent spells of fine weather. Thunderstorms are rarely experienced, and tornadoes are unknown. Snow and hard frost are also rare in the city, although one morning early in January 1913—a winter of exceptional severity—large icicles were found hanging from buildings in Los Angeles. Such an unusual sight caused a great deal of discussion; the leading newspapers contained editorials on the phenomenon, and enterprising photographers made the most of the occasion; while many of the younger people, who probably had never before seen either snow or ice, went into raptures over the occurrence!

The bulletin also states that on only fifteen days since 1877 has the winter temperature in the city been below thirty-two degrees, the lowest on record in that time being twenty-eight degrees above zero on 6th February 1883 and 7th January 1913.

II.

With such an 'all-the-year-round' climate it is not surprising that southern California attracts to its hospitable shores people from all parts of the world. Many go there for health reasons; some go on a visit to friends, and become so enamoured of the country that their return home is postponed to a date which in many cases is always in the future. Others, again, are drawn there by the strong attraction the state has for many people as an all-round vacation land; still others by the opportunities for advancement California offers to all who can recognise Opportunity when it comes knocking at the door.

The principal city in this land of 'eternal

sunshine' is Los Angeles—'The City of the Angels.' With a cosmopolitan population of over five hundred thousand people, this city is rapidly becoming one of the leading cities in the United States—a surprising fact when one considers that, apart from the production of moving-picture films, a few small shipbuilding-yards at Long Beach and Port Los Angeles (San Pedro), some fish-canneries, packing-houses, and other minor industries, the city is not, strictly speaking, an important industrial centre. Its prosperity depends largely on tourist traffic, though a true Angelenos will hardly ever admit the fact!

During the winter months tourists, globe-trotters, prospective settlers, 'hoboes'—gentlemen of the road who travel from place to place without paying railway fares, and who work only as long as it suits them to—pour into Los Angeles from all quarters, by trains, steamships, automobiles, and aeroplanes, and settle down to enjoy themselves until spring arrives. Then many of them 'fold their tents like the Arabs and as silently steal away'—the 'hoboes' especially!—but the greater number take up permanent residence, either in the city itself or in one of the smaller surrounding towns, and then write to their friends and acquaintances to 'hurry up and come to southern California, where the sun is always shining and where life is always worth living.'

The cost of living on the Pacific coast is, if anything, a trifle lower than in other sections of the continent, and, generally speaking, lower in Los Angeles than in the majority of the coast towns. But, on the other hand, there is tremendous competition in the labour market at all periods of the year—but more especially during the winter months—in all large towns on the Pacific coast, and wages, in consequence, vary in different places, according to the law of supply and demand. This is particularly the case in Los Angeles. There one finds many people willing to work at a lower figure than conditions warrant, simply because they desire to live in that city in preference to all others. This undercutting of wages affects the labour market accordingly; competition for work is very keen, and employment agencies—with high fees—are rife in all parts of the city. Somewhat higher remuneration than is obtainable in the city can be secured by workers who are willing to go to distant points in the county and the state, but especially to certain parts of Arizona, where one is cut off, in a large degree, from the many attractions and opportunities for amusement offered to dwellers in large cities.

Japanese labour is another factor which affects the labour market, particularly in agricultural pursuits. The little brown men are everywhere and in everything. They have their own colonies, churches, restaurants, employment bureaus, schools, film companies, and cinema theatres; they are actively interested in a great many major and minor industries in the entire state, and are lessees and owners of some of the choicest agricultural land in all parts of California. In some of the smaller counties in northern California the major portion of the cultivated acreage is owned, leased, or controlled by the Japanese.

During the summer of 1919—to quote from a copy of the *Los Angeles Times*—the price of vegetables and potatoes in that city was fixed arbitrarily by Japanese combines; while a strike of the Japanese fishermen not only cut off the fish-supply from the city, but threatened to close the canneries.

In the Imperial Valley—a rich agricultural section of southern California—the Japanese, it is stated, are purchasing the best farming-land in the district, in spite of California laws forbidding Japanese to own land in the state, or to lease it for a term of more than three years. But these laws are totally ineffective to prevent the wily Asiatic from making deals in land, for the simple reason that every male child of Japanese descent born in the state of California is entitled not only to lease land, but to own it outright. The shrewd fathers therefore buy land for their sons, and the childless for their wards. At the present time there is a regular boom in Japanese marriages in California, the reason being, no doubt, that it is only through the children born in that country that the Japanese can become landowners there.

The Japanese do not limit their working-day to eight hours; they are quite willing to double that number of hours during certain seasons of the year in order to increase their output and their earnings. They consume about one-third less food than does the average American workman, and instead of improving the communities they belong to, they invest their savings in more land, or send them to Japan. So grave has the Japanese menace become in California that strong efforts are being made at the present time by prominent people and state societies to induce the legislature there to pass an anti-Japanese law, and so call a halt to further invasion of the state by the Asiatics.

III.

Los Angeles—like other large American cities—is a city where people live at high pressure. Everybody is on the rush from early morning till late at night, and all, more or less, strenuously engaged in the fascinating business of trying to capture the almighty dollar—the national idol which the majority of the American people worship from the cradle to the grave!

In this melting-pot of nations—as Los Angeles is in a minor degree—the acquisition of money is comparatively easy in certain spheres of activity. For instance, in the real estate business many large sums change hands in the course of an ordinary day's work. Farms, acreage, vacant plots of land, houses, business

chances, sky-scrapers—no matter what it is, if negotiable at all, it can be disposed of here, either by sale or exchange. Some of the shrewdest business minds in the city are engaged in this lucrative profession, and many fortunes are made. While there are a large number of firms of high standing handling real estate here, there are also many concerns of which the same cannot be said. These, strange to say, find much business in the crowds of prospective settlers constantly arriving in the city, many of whom possess a few hundred dollars and a large faith in human nature!

In this city the selling of property—especially subdivisions—is a fine science, and those engaged in the business have not, as a rule, much to learn about it. New ideas are always being tried out, and fierce competition—to increase sales—is the rule. One method, generally successful, adopted by many concerns engaged in this business is to purchase from the owner or owners a large tract of land situated within easy travelling distance of the city. The land is divided into lots of various sizes and given an alluring title. Next an extensive advertising campaign is carried out, and free trips to view the property are offered to secure possible investors. In many cases an appetising lunch is also provided, free of charge, on the property. Certain days of each week are set aside for these excursions, and many people—mostly tourists—avail themselves of the opportunity thus afforded to view sections of the surrounding country. There is no obligation to purchase, although he is a poor salesman who allows a likely investor to slip through his fingers.

Though the people of Los Angeles lead a strenuous life endeavouring to increase their bank-account, they still find considerable time and energy to devote to amusement of all kinds. During the summer months thousands of the inhabitants betake themselves to the various 'beach towns'—Long Beach, Venice, Ocean Park, Santa Monica, &c.—and splash the golden hours away in surf-bathing, or loll on the sands and take sun-baths. Sun-bathing in a climate like that of southern California is probably the finest tonic work-weary toilers can obtain—provided the baths are taken properly. In the bath-houses at some of these beach towns are enclosures known as sun-parlours. These are simply a part of the beach fenced off by high walls—usually boards—with no roof of any kind to the enclosure. Inside, men—women and children are excluded—squat and loll, naked and unadorned (the baths are useless unless the whole body is exposed at one time). Short exposures are necessary to begin with; to start off with too long treatment is to incur a severe case of sunburn, which the bather will not forget in a hurry. A towel or two to recline on is necessary, as the bare boards are too hot to the touch. After lying in one position for about fifteen minutes the sun-bather changes to another—that is, unless he should fall asleep, which sometimes is unavoidable when being toasted. Every half-hour or so a cold shower is taken, to wash off the sweat and dirt; then the sun-bather resumes his recumbent position on the towels. After a week one can lie out in the sun for about two hours at a stretch with no injurious effect. After about a month of this treatment the skin will be a rich copper-colour and the whole body will radiate health. Sun-bathing invigorates and revitalises the system if carried out properly and not to excess; then it is very enervating.

Sunday is largely devoted to motoring trips. Automobiles in southern California are almost as common as potatoes in Ireland, and the majority of them seem to be in Los Angeles. On the day supposed to be given to rest the roads in all directions from the city, from daylight until well after midnight, are alive with cars of all sorts, sizes, and conditions, crammed full with merry parties of 'joy-riders.'

Southern California is famed for its excellent roads, and leads all states in the Union in this direction, especially in its provision for improvement and extension of its highways. From Los Angeles as a centre, one hundred miles a day may be covered for a month on asphalt boulevards sweeping through orange-groves, past magnificent fields of poppies, missions crumbling with age, through cañons fragrant with wild flowers, and past the mighty ocean. Over eleven thousand miles of paved, oiled, macadamised, and improved roads—of which over three thousand seven hundred miles are of recent construction—are available for the use of motorists.

The Automobile Club of Southern California—with headquarters at Los Angeles—is one of the most active of all such organisations in the world. Mainly through its instrumentality the National Old Trails transcontinental route—open to easy travel all the year round—for two thousand miles into Los Angeles is posted with signs for the guidance of motorists. Incidentally there are thirty thousand miles of roads thus posted, over sixty-eight thousand signs having been used in this connection. The club maintains an insurance department, a legal branch, a map and route service, a theft bureau, and a magazine devoted to the interests of its thousands of members and visiting motorists. In the course of a single year it has distributed over nine hundred thousand touring-maps, and has answered approximately one hundred and sixty-three thousand requests for touring information within a like period.

Much interesting matter might be written on the many peculiar industries and the great number of natural attractions of this sunny land, but space does not permit. It is hoped, however, that the little information now given may prove of interest to all, and especially to any who may contemplate a visit to the 'Golden State.'

SEVENTH SERIES

CLOUD-SPOTS AMONG THE STARS.

By Professor GEORGE FORBES, M.A., F.R.S.

I.

AFTER we have made friends of the stars and the planets they become real companions to us in a night walk. And still we are not satisfied. An irrepressible wondering, as to what there is beyond our vision, seizes each of us. We long to see deeper into the heavens, and to pick out any new things that a telescope can show. Giant telescopes may be beyond us, but the smallest spy-glass or binocular would be welcome at this stage.

With the help of such a plaything we can detect the phases of Venus, the moons of Jupiter, perhaps the ring of Saturn. The features of the moon, under different conditions of illumination during the month, are, by its aid, changed from a flat picture to a solid mountainous globe. The first glance with a small glass at the star-clouds of *Sagittarius*, the Archer, or *Cygnus*, the Swan, converts the plain white surface of the Milky Way into a new and crowded universe of small stars. Between the head of Perseus and Cassiopeia two lovely clusters of stars surprise us with their beauty. Here and there we pick up a double star, of double colour, like a pair of sparkling jewels. The first taste thus acquired of the pleasures of exploring whets the appetite, and from such a beginning the birth of many an astronomer may be reckoned.

And so our exploration may go on. With the help of a telescope we may add to the *number* of our friends: more stars, more planets, more satellites, more comets—and more detail in most of these. But there is only one class of objects revealed by the telescope entirely different from anything we see with the naked eye. These are certain minute, shining, cloud-like spots among the stars, called 'nebulæ.' It is perhaps too much to say that they can be seen only with a telescope. One or two are just visible to the naked eye. They have always been a puzzle to astronomers. And, with the increase of power given by newer and larger telescopes, an immense number of facts have been accumulated as to their numbers and distribution, their shapes, sizes, and constitution, their internal motions, and their paths among the stars. At the same time, with this increase of knowledge, they are, perhaps, more puzzling than ever, and far-reaching speculation has been brought to bear upon their relationship to the rest of the universe.

There are few discoveries revealed by the telescope more surprising than this: that the increased power of vision not only adds to the number of stars, but introduces to us a totally new class of objects not incomparable in number to the stars, exhibiting structural details such as stars cannot show, and forms suggestive of internal commotions like the whirlwind or the volcanic cloud.

When first discovered, these wonderful cloud-spots seemed all to belong to a single class, and to be nothing more than minute shining clouds, from which their name 'nebulæ' was derived. And so few were then known that they were treated as curiosities. In 1771 Messier observed and numbered one hundred and three of the most prominent nebulæ. His catalogue is still used for their identification. Thus Messier 13, or M. 13, is a remarkable cloud-spot in Hercules. Sir William Herschel's large telescope increased the number to over two thousand five hundred, and more powerful telescopes have added to the list. Finally, the prolonged exposure of a photographic plate is found to disclose a multitude of these minute cloud-spots all over the sky; and the latest estimate of their number is nearly a million. In one small piece of the sky, not much larger than the surface of the moon, no fewer than two hundred and forty-nine minute nebulæ have been photographed by the great telescope of the Lick Observatory.

But the increase in size of telescopes has brought to us news about these nebulæ far more exciting than their mere numbers. In 1848 Lord Rosse eclipsed all previous efforts by making, erecting, and using in Ireland his great 72-inch reflecting telescope, at a cost of twelve thousand pounds. He then set to work on the nebulæ. He added to their number, but his greatest contribution to astronomy was in the careful drawings he made of their shapes.

In the case of very many, he was able to resolve the shining cloud into aggregations of minute stars, sometimes into globular clusters, but more often into star-groups or strings of various shapes, many of these demanding a still

 [*All Rights Reserved.*]

greater telescopic power for entirely resolving the mass of light into discrete stars. His greatest discovery was that a very large number of these nebulæ show a spiral form in the strings of stars and wisps of glowing unresolved light. Later researches with even more powerful telescopes, assisted by photography, have resolved more and more of the nebulæ into spirals, until to-day that form is generally attributed to the great majority of nebulæ, even when the form cannot be detected in the feeble or minute delineation.

Let us pass now from globular clusters and spiral nebulæ, in all of which there is evidence that, by the use of higher and higher optical powers, their glowing masses will be the more completely resolved into their thousands of constituent stars. The next class of cloud-spots that excite our interest are very different. These are generally round, like the globular clusters, but differ from them in three respects. They cannot be resolved into stars. Their light is not concentrated at the centre, as when we look at a globe full of points of light, and in colour they differ from the clusters, being of a bluish-green, milky tint. These pale glowing discs are called 'planetary nebulæ,' because they resemble a planet more than a star. They can never be resolved into star-clusters. But there is a remarkable feature possessed by nearly all of them. In the centre of each planetary nebula there is a faint star. Moreover, this faint star always has a peculiar spectrum, which is very significant, and to which attention must be paid.

Besides all these nebulæ that have been named, there are irregular patches of brightness; and, again, vast regions of the sky, covering a whole constellation or more, where the stars are found to be bedded in a sea of nebulous gas. There are also dark nebulæ, not hot enough to shine, hiding the stars that lie behind them.

The numbers, the diversity, and the structure of the nebulæ call for the exercise of the keenest eyesight and intellect to discover all about them, and the place they occupy in the architecture of the heavens, and in the slow but sure development of events during billions of years.

II.

After this general survey of what he is to expect, the star-lover is not likely to delay much before going out at night to get a naked-eye glimpse of one or two of these objects, and then resorting, it may be, to a binocular. Any night when our old friend Vega is high in the sky is a good occasion to look for one of the finest globular clusters—Messier 13, in Hercules. This is close to the ring of stars called Corona Borealis [the plough-shaft, or the tail of the Great Bear, nearly points to Corona]. The cluster, M. 13, is about the same distance from the Pole-star as Vega, and close to Corona. It is the finest object of its class that is visible in our latitudes. It is visible as a mere cloud-point without a telescope, and remains structureless even in a 4- or 5-inch telescope with a high power. But when seen through a really large telescope it looks like a swarm of bees, or one of the globular clusters of gnats or midges to be seen of a summer evening on the banks of any Scottish river.

The autumn or early winter evenings are suitable for a good look at the constellation Andromeda. It is easily recognised by the line of three stars (Alpha, Beta, Gamma of Andromeda) that starts from the left top corner of the great square of Pegasus, and runs to the left towards Perseus. Here may be easily seen, without the help of a telescope, a faint object, which is really the largest and brightest of these wonderful nebulæ that assume the spiral form. To find it, look at Gamma, the left star of the three, and Beta, the middle one. Notice the length of the line joining them. At half this distance from Beta, in a direction at right angles to the line of three stars, a careful search will soon find a small, hazy, comet-like spot. This is the great Andromeda nebula, M. 31. A small telescope fails to show the details of structure, but there are not many objects in the heavens more surprising or more suggestive than this spiral nebula when seen through a powerful telescope.

Let us now turn to Orion, who reaches his highest altitude in the sky five or six hours later than Andromeda, or at the same hour two or three months later. Everybody knows this splendid constellation, the most brilliant of all. Orion's sword-scabbard points to the Pole, and, in the middle of the sword, a close scrutiny seems to suggest a luminous haze without form. A very small telescope shows it as a clear, bright patch. This is the great Orion nebula, which is in many ways the greatest and most wonderful of all the nebulæ in the sky. Whether the nebula itself can ever be recognised with the naked eye is very doubtful; though there is something to be seen, rather like the glow we sometimes get from a group of stars too small to be visible. But the astronomer who knows what wonders exist in this nebula is glad in his midnight walks to be able to recognise that slight indication of its presence.

With a small telescope, other nebulæ of the same kind may be seen beside the three stars of Orion's belt. They are all part of one great extended nebula that is known to cover the whole constellation, and beyond.

III.

Having now learned of the most conspicuous nebulæ that are within our reach in the absence of a very large telescope, the next thing for us to do is to examine the wonderful shapes of the nebulæ through a very large telescope. But if every

reader were to make this demand upon the six or eight very large telescopes of the world, the progress of discovery would receive a severe check. Fortunately there is a remedy arising out of the modern method of using these large telescopes.

The largest telescope in the Empire, whose performances equal, if they do not excel, in many particulars, all others, is the great reflector of 73 inches diameter in the splendid climate of Victoria, British Columbia. The only others comparable with it for certain purposes are the 60-inch and 100-inch reflectors at Mount Wilson, in California. The largest *refractors* are at the Lick Observatory in California and the Yerkes Observatory at Chicago.

Now the value of all these huge telescopes has been greatly enhanced by the art of photography. We are able, by prolonged exposure of a photographic plate in the focus of a telescope—not only from hour to hour, but again, with the same plate, from night to night—to record the existence and position of objects invisible to the human eye with the most powerful optical aid.

There is no department in astronomy in which the application of photography appeals to the human mind more than in the marvellous pictures that have thus been produced of the shape and structure of the nebulæ. And this is the principal reason why, in these days, those who are interested in the heavens can follow the discoveries about these marvellous cloud-spots far better than in the days of Herschel or Lord Rosse. It is not every star-lover who can, like those great men, build for himself his own large telescope; but he possesses one advantage. The huge telescope, denied to him, may have cost altogether a hundred thousand pounds before it could do its work. And yet, for a shilling or two, he can become the possessor of a print or a lantern-slide of any of these nebulæ, containing nearly all the details that can be detected by the astronomer himself who controls that priceless observatory. It is impossible by mere words to describe the surprise, wonder, and awe which fill the mind of any one when first brought face to face with these marvellous photographs.

Herschel's telescope showed the finest spiral nebula as a single ring, one half of its contour surrounding a very bright globular nebula at its centre; and beyond the ring another very small round nebula. Lord Rosse's great reflector disclosed a spiral structure in this nebula whose wisps of countless suns and nebulous stuff start from a central nucleus in spiral curves outwards. In the latest photographs details hitherto unseen are portrayed; and we can, in imagination, almost trace the course of events. Two great clusters of innumerable suns would seem to have collided indirectly and not centrally. And so they may have been sent spinning and drawing out their trains of stars into two united spirals. This is the most striking example of all the spiral nebulæ. It is in the Hunting Dogs, below the tail of the Great Bear. Others of a similar shape, and nearly as wonderful, are in the Virgin and the Great Bear. In shape they are like the strings of a mop when twirled round its handle. Or they look like the Catherine-wheels of a firework display.

All of them suggest motion, rotation, a force of attraction, and myriads of years as having combined to develop these marvellous structures. All this is at a distance from us so great that each one of them may be of enormous size, and may well comprise a duplicate of our own complete stellar system and Milky Way.

The nebulæ are not uniformly scattered over the sky. They are localised in many ways. The constellation Virgo contains hosts of these telescopic objects, while the opposite region of the celestial sphere is comparatively bare of them. All spiral nebulæ are not so placed as to be seen by us 'full-face.' The great Andromeda nebula presents a three-quarter face portrait, and many are seen side-face or edge-on. In the photographs of these last we may see a luminous, bun-shaped, central glowing mass, probably made up of stars, and its spiral ring is seen as a long band of light cutting through the central nucleus. Often along the middle of this band there is a black central line, showing up well against the bright nucleus. This suggests that the outer regions of the spiral ring are neither luminous nor transparent, but made of cold, dust-like matter that is opaque.

Then, again, we see queer things happening. The spirals are supposed to be the milky way of each nebula. Now, in the milky way of the Andromeda nebula a great many 'new stars' have been seen to burst forth, to shine for a time, and disappear, just as they do in our own Milky Way. Of course, they are hundreds of thousands of times feebler, owing to their great distance from us.

No one can doubt, after inspecting the photographs of the spiral nebulæ, that these enormous masses, or independent universes, are in rotation, even before any confirmation is forthcoming. So we are not surprised to learn that, in the last few years, actual measurements have been made of rotation in one or two of them.

And, when passing from spirals to the globular clusters, if we reflect that the force of attraction between all particles of matter probably extends over all space, then the globular clusters do also suggest rotation to prevent their collapse by attraction to the centre of the cluster. We may hope some day to have these motions made visible by a comparison of photographs taken at intervals of many years.

IV.

The photographs of nebulæ, whether of the cluster or the spiral form, open out to us new visions of infinity and eternity, developing under

the same all-governing laws of force under which our everyday life is controlled. The photographs of 'planetary' nebulæ now demand our attention. They add still more to our wonderment, for their variety of shape, their constitution, their movements, their position in space, and their evident relationships to certain stars all seem to supply a basis for speculation of far-reaching character, although little can be claimed as being positive knowledge.

Most of them are nearly uniformly illuminated compact patches of light, generally round or oval. Some show a certain amount of structural detail. Some of them are ring-shaped, and the most famous of these is one in the Lyre, not far from Vega, about the apparent size of Jupiter. It is not black inside the ring, but faintly luminous, and, as in nearly every planetary nebula, its centre is occupied by a star. And the colour of the planetary nebulæ, pale greenish-blue, is quite different from that of the white nebulæ, which include clusters and spirals.

The reason for this fundamental difference in colour between planetaries and white nebulæ is the great discovery made by Sir William Huggins on the 29th August 1864. On that date, a few years only after the invention of the spectroscope, he pointed one of these instruments at a planetary nebula near the Pole, in Draco. He was astonished! For the first time in the world's history, he knew that he was looking upon one of the lights of heaven that consisted of a glowing gas.

A prism is a wedge of glass. On our looking at the sun through such a wedge it seems to be shifted to another place, and no longer appears like a round sun, but like a band of colour, the shift being different for each of the many colours of which white light is composed. So it is with a candle whose light comes from glowing carbon, not hot enough to be in the gaseous state. But light coming from a glowing gas is different. A spirit-lamp is hot, but not bright. When you put a pinch of salt into the flame, the sodium, one of the elements of which salt is made, is vaporised, and it shines, a bright, yellow candle-flame. Seen through the glass wedge, or prism, this flame is certainly displaced, but only a single bright, yellow image of the flame is seen.

When Huggins looked through his prism at the planetary nebula in Draco he saw at first only a single image. It certainly was not drawn out into a band of colours; and he knew, for certain, that planetary nebulæ are made of gas, whereas the spiral nebulæ are composed of condensed material, like the sun.

Now, in the last few years, the distances of some of the planetaries have actually been measured. This enables us to learn their diameters. These are enormous. If we take as our unit the distance from the earth to the sun, the diameter of the smallest planetary that has been measured is thirteen hundred and fifty times the length of that unit, and the largest yet measured is ten thousand times the length of our unit. A sphere that would envelop the whole solar system would be only a small fraction of the smallest planetary nebula in size.

Planetaries are not the only nebulæ that are made of gas. The brightest, and in many ways the most wonderful, nebula in the sky is the great Orion nebula, and, like all those classed as irregular, it is made of gas. In form it looks like a sun-lit thunder-cloud, torn by conflicting internal forces.

There are many other gaseous nebulæ easily found in Orion and the neighbouring constellations. And the whole of that region of the sky, when photographed with a wide-angle lens in a camera, is, after many hours' exposure, found to be aglow with nebulous light. The gases or vapours which we find to exist in these nebulæ are, in all cases, the same; they are the lightest gases known upon the earth, hydrogen and helium. But, in addition, the spectrum declares still more emphatically the existence of a new chemical element, unknown upon this globe; and to it has been appropriately given the name 'nebulium.'

Among the stars themselves helium is characteristic only of stars that are in limited groups in certain constellations in the Milky Way. Orion and the Ship are full of them. And it has been found that the gas in the great nebula of Orion, and in the cloud of gas which is spread over that constellation, and the more solid stars containing helium in that constellation, are all travelling together in space, in the same direction, and at the same velocity. They form a detached system.

Irregular nebulæ made of gas are found in other parts of the Milky Way; and wide-spreading clouds of gas, like the one covering the constellation of Orion, have been discovered in the Bull, the Scorpion, and Ophiuchus. But all gaseous nebulæ are strictly localised. They group themselves most decidedly in and close to the star-clouds of the Milky Way. The total number of visible planetary nebulæ that have been discovered does not reach the modest figure of two hundred. But we have plenty of evidence of the existence of large numbers of invisible nebulæ, not hot enough to shine with their own light, and hiding all the stars that may be behind them, so as to look like black patches on the luminous background.

One great generalisation does stand out. The gaseous nebulæ are part of the Milky Way. The 'white nebulæ'—that is, globular clusters and spirals—are not found in that region of the sky. The gaseous nebulæ ought to be looked upon as an important part of our own stellar universe, if we are to regard the spiral nebulæ as being independent isolated universes like our own, separated from us and from each other by immeasurable volumes of blank, empty

space. This is a hypothesis which is supported already by some significant facts; and, so long as we bear in mind that it is only a hypothesis, which can be discarded if necessary, it helps us to collect many astronomical facts into a consistent scheme.

Thus we fit into such a hypothesis the new facts that come to our knowledge. It is something to know, what we are told by the spectroscope, that gaseous nebulæ in the Milky Way often travel with a velocity of forty or fifty miles a second, such as is reached by the stars. But from the same source of information we also learn that the spiral nebulæ attain velocities of nearly one thousand miles a second.

Then, again, as to their size or mass. In some of the planetary nebulæ whose distance is known, the two opposite sides of the ball are found to have opposite velocities, one side coming towards us, the other going from us. If, as seems right, we attribute this to rotation of the body of gas, the theory of gravitation tells us the actual weight, or rather mass, of the nebula compared with the sun. Already, in this way, preliminary estimates have been made of the masses of three planetary nebulæ. One is one hundred and sixty-two times as massive as the sun; another is nineteen times. And the ring nebula in Lyra is nearly four times as massive as the sun.

Regarding the great spiral universes, we have not the same kind of exact measurement. All that may be said is that astronomers have, in the last few years, been much helped towards fruitful speculation and hypothesis by some of the ablest mathematical investigators of dynamical problems. Often these searchers after truth are able to tell what would be true if certain assumptions could be accepted. Now, one of the 'probable truths' which have been reached in this way is that the mass of a spiral nebula is many thousand times that of the sun. In fact, the Andromeda nebula would be of the same order of magnitude as the whole of our stellar universe, including all the occupants of the Milky Way. This, if true, gives strong support to the 'island-universe' theory of spiral nebulæ.

In conclusion, the important truth remains, that the great and wonderful new class of objects revealed to us by the telescope, the white globular clusters and spiral nebulæ, along with the gaseous, planetary, irregular, and diffuse nebulæ, constitute a very important link, possibly even the key to our final understanding and interpretation of the structure of the universe.

MAN'S WORK.

CHAPTER IX.—*continued.*

III.

AS a matter of fact, visitors were not particularly welcome. Shanklin decided, after a few days of attempted exclusion, that to keep people out only attracted attention. The derrick was but a few hundred yards from the highway, and every few hours some stranger stopped his car, strolled over between the orange-trees, and peered inquisitively about. Harrison was too used to it to be affected, and by-and-by Shanklin became equally indifferent. Their venture had received no publicity. It was regarded by competent oil-men as a wild-cat well.

The thing that taxed them both was money—or the lack of it. Ten thousand dollars had not gone far. Applying to sources which he thought promising, Shanklin found that it was impossible for a discharged clerk to borrow. They had their secret, but both felt it was too precious to reveal, and disclosing it would only prejudice their chances of retaining control. There was the ultimate resort of selling Harrison's tiny ranch.

'We go on as we are till the last tick of the clock; then we'll have to let the thing out. You can imagine what will happen. We'll have to play one of the big fellows against another, and take what he's willing to give us.'

'Our option runs to 1st September — three months from to-day. We've got eighteen hundred feet to go,' mused Harrison. 'I've done a bigger footage in less time, and I wasn't working for myself either. That end of it's all right. As to the money, perhaps we've bitten off more than we can chew.'

Shanklin shrugged his shoulders. 'If I were a promoter, I'd say that was a prospective investor.' He pointed to a figure stepping briskly towards them.

Harrison swore softly. 'You're the ladies' man.' Then he disappeared.

The figure drew nearer, and Shanklin recognised it as that of the girl with the gray eyes. There was something mysterious in her appearance so close at hand.

'Good-morning,' she said brightly; then, with another glance, 'Oh—it's you!'

'It unquestionably is.' Something prompted him suddenly to mirth. 'I hope you've made your fortune.'

The gray eyes met his own in utter frankness. 'How did you know?'

Shanklin chuckled. 'Oh, a little bird.' He noted her changing expression. 'I hadn't been introduced—but I hope you're not angry with me.'

'No, not exactly angry; but—I know now.'

He laughed outright. 'I can only compliment you on I know not what.'

'Your photograph,' she said quite seriously.

'Now you 're complimenting me.'

'Please, don't; I found it in *Marcus Aurelius*.'

He pulled down his brows at that. 'Will you please tell me who you are?'

'But you 're not what I was told you were.' She shook her head decisively. 'I 'm sure of that.'

'I don't know whether to be glad or sorry.' Shanklin was utterly at sea.

'My name is Edith Winter.'

'It wouldn't take many of you to make a summer. Mine is John Shanklin.' He lifted his hat. 'Now, will you tell me about my photograph?'

'Only that I saw it in the house of some people, where I was staying, and I remembered, because it was so very like a man I know—very well indeed.'

'Thank you, for both of us.'

It was her turn to laugh. 'Do you know why I 'm out here?'

'No; but I 'm glad you are.'

She surveyed him quite gravely, then seemed visibly to make up her mind. 'I want to see Mr Sitwell about this property.'

Shanklin lit a cigarette with the utmost deliberation. 'Would you mind telling me why you want to see him, because I 'm—well—interested myself?'

'Oh!' The idea obviously pleased her. 'I want Mr Sitwell to let me in on it. He controls it, doesn't he?'

'Well, not yet; in fact, I wasn't aware that he had any interest whatever. Indeed, for your personal information, I may say he hasn't.'

'You 're making fun of me. He must have, because he 's offered it for sale in New York.'

Shanklin forgot about the cigarette. 'Really? To whom?'

'I can't tell you. Perhaps I shouldn't have said anything about it. Don't look at me like that.' She stamped a small foot.

'Quite so; but now that you have said it, you mustn't mind if I 'm interested to hear that Mr Sitwell has offered my property for sale.'

'Then he hasn't anything to do with it?'

'If I may put it that way—not a darn thing.'

The girl sat down suddenly. 'Don't mind me. I 'm only a little dizzy.'

'I begin to feel that way myself.'

'But he must have something to do with it, or he wouldn't have dared. Do you own this property?'

'My partner and I have an option—and——' He broke off with a low whistle. 'Do you mind waiting till I walk down to the ranch-house and back? It will take ten minutes. That 's my partner on the other side of the derrick, pretending not to see you. He doesn't like ladies.'

Shanklin strode off, his brain working like a dynamo. Ten minutes later he came back, his lips pressed tight. 'I 'm very much obliged to you—very much indeed. That explains everything about the carpenter.'

'This isn't Alice in Wonderland. What do you mean?'

'If I were in a jocular mood, I 'd say it was Edith in Blunderland—but I 'm not. The carpenter—well, he doesn't really matter. What does matter is that Mr Sitwell expects to secure this property on 1st September.'

'But your option?'

'Sitwell expects that it will not be exercised.'

'Why?'

'Because he 'll do all he can to prevent it.' He looked at her sharply. 'Since you know so much, perhaps you can tell me if he sent an engineer here yesterday?'

'Yes, he did.'

'Can you tell me who it was?'

'Yes—the man I 'm going to marry.'

Shanklin gulped. 'Thank you—it 's a little sudden—but thank you all the same. I 'm sure you 'll both be very happy.'

'Didn't you like him?' she queried.

'I must confess that I took to him at once—even without knowing what you 've just told me.'

'Mr Shanklin,' she said, with a long, straight look, 'may I tell you something?'

'Yes, if you think I can stand any more. You 've told me a good deal already.'

'Do you know Mr Sitwell well?'

'I 'd hate to tell you how well I know him. But that 's not telling one anything.'

'And do you like him?'

'Do you like snakes?' he parried.

'When they 're in cages I don't mind them,' she said significantly. 'When I came out here I honestly thought he owned this property.'

'Who—the snake?'

She nodded. 'Now I begin to see things. You know, you 're very like your photograph.'

'He was a daisy photographer,' countered Shanklin. 'What do you see? I've been seeing things ever since you arrived.'

'Why Mr Sitwell is forgetting the Enterprise; why I got a letter about it from—well—a friend; why you whispered to me a month ago; why Jim smiled so when he went off yesterday.'

'I saw Jim smile myself, and it was a rip-snorter. Please go on.'

'Mr Shanklin, is there any chance of my investing in this property—now—with you?'

His jaw dropped. 'Invest! Good Lord!' he breathed. 'Could you finish the sentence?'

IV.

Shanklin stared at her, dumb with this incredible thing. Then, noting the sheer delicacy of her features and the brightness of her eyes, he remembered the excited face of her mother when she spoke of putting the girl's

money into oil, instead of letting it languish in Government bonds.

'Just how much money do you mean?'

'Twenty thousand dollars.'

He winced a little. 'That's all you have?'

She nodded. 'Yes; and I have the farm. It's my inheritance from my father.'

'And you want to slam the whole twenty thousand in here?' His voice had a touch of awe.

'I certainly do. To-morrow, if you like.'

He winced again, wondering how much of this sort of thing he could stand. Then, slowly, 'I can't take it.'

Her eyes clouded. 'You mean you won't—won't let me in?'

'If I said to you that I objected to your gambling your inheritance on a well that might strike no oil, would you believe me?'

'I think I'd believe anything you said. But——'

'Thank you; but what?'

'This isn't that kind of a well.'

'I'm mighty glad to hear it. Where did you get the information?'

'From Jim.'

'Oh! And what did Jim say?'

'He didn't say anything; he just smiled. I knew what that meant.'

Something amusing, and in a queer way infinitely tender, plucked at Shanklin's heart.

'You evidently understand each other remarkably well—but—I'm sorry. How would you feel if this turned out a dry well? I don't think it will myself—but it may.'

'If it weren't a big thing, Spencer Martin wouldn't be interested,' she answered quickly. 'Oh, what have I said?' She seemed suddenly overwhelmed; then with an assumption of calmness, 'Do you see what I'm banking on?'

'Jim is my first guess. So he's for Spencer Martin?'

'Yes. Now will you take that money?'

Shanklin felt a little weak. 'I've got a partner. I've told you how I feel; let's see what he says.'

'The one who doesn't like ladies?'

'He may have got over that by now.' Shanklin strode round the derrick. 'Harrison, come here!'

'Can't. I'm busy.'

'He hasn't got over it, but I'll fetch him.' Presently he reappeared, with Harrison at his heels like a sulky pup. 'This is Miss Winter. She has been telling me a few things you'll find interesting.' He glanced at the girl. 'Shall I repeat them?'

She nodded, and he went over the story point by point. Harrison listened, his head a little on one side. When it came to Sitwell, his face turned a dusky purple. The shade remained while he heard about Hunt and Spencer Martin. Then Shanklin outlined the girl's proposal, omitting nothing about the farm and her inheritance.

'It sounds almost as though I had advised her to leave the Enterprise alone, hoping she'd drift along to us later,' he concluded gravely.

Harrison sat for several minutes quite motionless. His partner knew what thoughts were moving within him. This was manna from the skies, and, even less expected, the solution of all their trials. Presently Harrison looked up.

'You'd better keep your money. We'd sooner have it from them that might miss it less. It would come mighty handy; but I reckon you're wiser to stay out.'

'I told you,' said Shanklin softly.

'What did you tell her?' demanded his partner.

'Just what you have.'

The girl sprang to her feet. 'If I needed anything more, I've got it. You splendid men!'

Shanklin stared at her. 'The lady's talking to you, Harrison.'

'I'm talking to both of you,' she flashed. 'You've got to take this money—every cent of it. I can do with the farm—if it is lost. But it won't be. Jim must not know anything about it. It would be too awkward for him. And as to Mr Sitwell, he won't know either. Is it enough to finish the well?'

'It would be, if we took it.' Harrison spoke gravely.

'And I'd be a partner?'

'If you were anything at all.' Shanklin shook his head. 'Don't you see how we both feel about this thing?'

The girl stood very straight. 'If you don't take it,' she said with absolute sincerity, 'I'll give it to Mr Sitwell to invest for me. I know the risk, and I know what it would mean to have partners like you. I won't worry you by hanging about, and I won't ask silly questions. If you think I can help in any other way, you'll let me know. I'm not a fool or a sluggard. Now, is it going to be you, or Mr Sitwell? I told you I don't like snakes, but sometimes even they win out.'

Shanklin drew a long breath and glanced at his partner. There was a moment's silence.

'I'd hate to see Sitwell with the lady's money,' rumbled Harrison gruffly. 'Perhaps we need another partner.'

Shanklin chuckled. 'I thought he was getting over his dislike for your sex. Shake hands, partner.'

'What strong fingers you have!' she said. 'Gracious! I forgot all about that car. I'll be back in a day or two with the money.'

'Going into the city now?' Shanklin asked with a grin. 'Take me with you?'

'Nothing could be more appropriate. Come along.'

THE SAND-EEL.

By A. MACDONALD.

I.

ONE may study the menu of our best restaurants for long enough and seldom, if ever, find the fish course described as 'Fish of the launce,' otherwise the humble sand-eel; yet this beautiful, silvery little fish is one of the most palatable morsels that can come out of the sea. Unlike its bigger relative, the slimy black eel, this delicate creature makes its home in the crisp, loose sand of the banks of the sea-pools along our shores and fords. Preyed upon relentlessly by other voracious fishes, nature has provided it with only one means of protection—namely, its capacity for burrowing into the soft sand, completely hiding itself from its pursuers. The similarity of its silvery colouring to its environment also gets it out of many a tight corner. On the slightest approach of danger it quickly buries itself snugly in the soft sand. The salmon, epicurean in its tastes, is one of the sand-eel's bitterest enemies, often putting such zest into the chase as to throw itself completely on to the dry bank or into shallows from which it cannot escape—a position which endangers its own existence, unless the rising tide mercifully releases it. Even gasping for life for a period on a dry sand-bank will not teach it a lesson, for after being released, and lying moodily for a while against a rock or a bank, the angler's hook, baited with a sand-eel, will lure it to its death as sure as hooks are hooks. The delicious eel seems to be a resistless temptation. Because of this constant persecution by its rapacious enemies, the sand-eel, however prolific it may be, is not abundant; hence its absence from the markets and the tables of the city.

In the islands of Uist—sometimes described as the 'angler's paradise'—are many fords in which are numerous sea-water pools. Here, when the tide recedes and the water is shallow over the loose sand-banks, the silvery sand-eel is found. Its best season is autumn. When the Uist housewife takes a notion for a plate of sand-eels, she chooses a moonlight night and the low ebb of a neap-tide to catch them. The night is chosen because the phosphorescent glow of the silvery eel betrays its presence should it show itself the least bit in its snug sand-bed, and the low ebb enables the fisher—usually a woman—to reach the farthest out banks. Now, the sand-eel is neither fished nor netted, and the labour of getting it is locally called 'lifting.' The only apparatus used is a 'hook' like a reaping-hook, except that its inner curve is blunt and notched like a saw, so that, when it comes in contact with a fish, the latter is not cut through, but slightly impaled. Armed with this and with a large pouch slung from her waist, the housewife sallies forth when a favourable night comes. She discards boots and stockings, and, with her skirts kirtled well over the knees, she wades softly and quietly along the sand-bank. The hook is brought into use by drawing it vertically through the loose sand towards her from all directions; the moment an impact with a fish occurs she draws it smartly upwards. The quick motion through the sand and water keeps the slippery eel impaled on the notches, but if there is a second's hesitation the fisher will have the disappointment of seeing it wriggle gracefully away in the clear water.

'Sand-eel lifting' has its own peculiar excitement and pleasures. The unexpected bite of an aggressive crab is sometimes an effective encouragement to lose one's balance in the water, and if at the next moment a big flounder rushes madly along and strikes the other foot in its blind rush, the fisher hasn't a leg to stand on. There is only one result to such a situation, and that is to flop into the water. Perhaps the fisher doesn't mind this; what with falling into holes and launching out right and left with her hook after escaping eels, she is soaking wet from top to toe soon after she has started. The pleasure comes, after a change of clothes, from the exhilarating effect of the salt-water bath. Indeed, this effect is greatly enhanced through the exercise, the walk home, and the wet clothing keeping the heat in and the cold air from the body, so that the cheerful, invigorating feeling lasts much longer than it does after an ordinary sea-bath. Such form of sport ought to be specially recommended to anæmic young ladies or run-down young blades who jump at the sound of a motor-hooter behind them.

'Sand-eel lifting' has also an element of danger attached to it, for patches of quicksands are frequent. The unwary, walking into one of these, might easily get swallowed up or held firmly until the rising tide put an end to his struggles. Happily such accidents are few and far between, possibly because the sport is not popular with strangers, and the native, conversant with the risks, only indulges in it because of the necessity of having eels for bait or for breakfast.

The eeriness of miles of wet sand glistening in the moonlight brings upon one a feeling of awe, and more than one timid person, seeing the shadow of a cloud moving slowly across the surface, has run home 'with the wind up,' certain that he had seen the spectre of a funeral wending its way slowly along the sand.

This was a sure premonition of a local disaster at sea, and some of the more superstitious natives still so far believe in such spectres that they do not like to allow their children to visit the pools until the incident is forgotten.

II.

The havoc caused among the sand-eels in these pools during the salmon's migration to the spawning-ground of the streams and lochs of the moors must be enormous. When the tide recedes and leaves dry—except for shallow channels and pools—stretches of sand miles in extent, the salmon, whose natural and instinctive bent for the time being is to ascend, will not recede with it, but will remain in what water it can find until the tide flows again. During this interval shoals of salmon remain almost motionless in the deepest pools, and so thickly do they assemble that a smart boy can spear half-a-dozen of them with a hay-fork or a stable graip in very little time, providing he escapes the vigilance of the water-bailiff. Before the days of salmon protection laws, the writer's father and two brothers drew a large-meshed trawl once along one of these pools, and though the mesh was large enough to allow medium-sized fish to get through, the catch was sufficient to fill a cart. The local doctor, with two or three friends, trawled the same pool the following night with a smaller-meshed net, and the result was two cartloads of fish. This particular pool has, within recent years, 'filled up' with the shifting sand. While the salmon remain in the pool the little sand-eel has little chance of indulging in its wriggling; hence the fisher finds it more abundant in the sand, and learns that the best 'season' is during the salmon's migration to fresh water. After the ascent, the sand-eel, freed from its presence, is more on the swim and less in the sand, and the season for lifting may be said to be over.

In the sea, as elsewhere, it is a case of the survival of the fittest, and the rapacious salmon is frequently caught at its own game of plunder. Occasionally a marauding seal will steal its way quietly up the ford, and its advent in the pool is the signal for a general scramble to get out of the way. The consternation among the salmon and the hastiness of their retreat along the shallow channels cause, it is said, many of them to cast their burden of roe in their rush to safety.

The naturalist who would record the speed at which a seal or a salmon travels at high pressure may do so at one of these fords, provided he is possessed of a full share of that unlimited patience usually attributed to observers of the habits of fishes. This patience is necessary, not because a race between a seal and a salmon is of uncommon occurrence, but because it is not always held under spectacular conditions, for these conditions are only provided in the straight, narrow channels at the mouths of rivers or in fords. Properly speaking, the race takes the nature of a chase—the seal racing for its prey and the salmon for its life—and top speed is assured. A Uist ford known to the writer is peculiarly adapted—a regular Epsom course—for this kind of race. It is a narrow indentation of the land some two miles in length, spreading out at its landward end at either side in the form of a capital T to over five miles in breadth. Its sea end opens into the Atlantic, and the shore on both sides is of the whitest sand. Haskeir rock, some four miles to the north, is a basking and reposing place for hundreds of seals; while the ford, which is deep at high water, is an avenue through which shoals of salmon pass in their migration to fresh water. This close proximity of the habitat of the seal to the highway of the salmon tends to bring seal and salmon into frequent contests of speed, and as the latter's natural direction is towards higher ground, the ford lends itself as venue for the struggle. An interesting and exciting incident of this kind was related to the writer by a friend some time ago. Standing on the north shore of the ford one day, at a point where it narrows down to about ninety yards, he noticed a salmon leap out of the water with a long forward motion. This seemed peculiar, as the playful salmon usually leaps upward, dropping side-on; but at the same moment the snout of a seal appeared with a rush some twenty yards behind. With a flick of its hind-feet it as quickly disappeared, leaving a slight ripple behind it on the placid waters. The salmon was swimming for his life. Both seemed to be travelling near the surface, for a slight commotion on the glass-like water in their trail showed clearly the course they were taking. Once or twice the salmon leaped, trying to baffle his pursuer, but almost simultaneously with the leap the shining head and snout of the seal appeared on the surface. The race was under observation for well over a quarter of a mile, and though the observer did not see the finish, he saw that the seal had gained fast in the distance they had travelled. It may safely be assumed that the seal caught its quarry, which is somewhat to its credit, considering that the salmon is one of the swiftest fishes in the sea; but it is more than likely that the seal's strength and endurance enabled it to do so, rather than its supposed superior speed.

Of recent years the salmon in these fords are decidedly less numerous. This is due, no doubt, to the presence of poaching trawlers near the coast, for the black hull of one of these is occasionally seen slinking away in the gray dawn of the autumn morning. The inhabitants are too indifferent to report the matter, and His Majesty's policeman of these northern seas is too busy to peer into the nooks and corners of the sea that cut in between the sand-dunes of Uist.

THE VISITOR.

PART II.

VI.

IT was a little later in the year—the middle of April—that I came to Friar's Entry again. I had decided to live there and make it my home. I spent a fortnight in London, saw many friends, and did much necessary business and shopping. Nothing could have afforded a greater contrast to the life I was going back to. At times I could scarcely believe that Friar's Entry and its problem were waiting for me. But I was not prepared to give it up without a struggle. I took commonplace measures. I bought bright curtains, chintzes, and some furniture sufficiently comfortable without being obviously modern, with which to fill the drawing-room. With these, with open windows, and the flowers and the sunlight of the coming summer, I was going to see what I could do.

Isabel Vane wrote that she had engaged a woman to cook. Mrs Garfitt had left Lostminster, and in some ways I was glad. Neither of my new servants would have heard any stories. The second was a war-widow from my old home in Norfolk. There was a third addition to our party, a smooth-haired fox-terrier, a present from Isabel Vane.

I arrived in the evening. The hall bore a depressing aspect—packing-cases, letters, and accumulations of every sort.

I dined alone. I had my own reasons for being in an unsettled state of mind at that time, but, apart from that, I could not help noting, the moment I entered, that the shadow on the house had deepened.

The next morning Isabel Vane called in to see me, and found me in the library, deep in my uncle's papers. We walked out together to visit his grave.

'You know that Goodyear is gone too?' she said.

'Yes; you wrote to me that he had died last winter. That's the last channel closed.'

'Let me know if I can be of any use to you,' she replied.

'You can. Keep everybody away from Friar's Entry. I want to be alone absolutely, to devote myself to the investigation without a hand to hold me back to ordinary life. If I am to receive a strange visitor, I must myself go halfway to meet him.'

She did not reply, but I thought I saw that in her opinion I was a little insane. I did not really care. I prepared elaborately to cut myself off from the companionship of the outside world.

I spent a week unpacking, buying, refitting. Electricians and workmen passed through the house like a pageant. I wrote letters, catalogued, and cleared all business from my conscience. As I watched the new hangings and furniture coming in—perilously dear in those days of inflated prices—I realised that I had given myself some trouble to prepare for victory.

I received only one set-back.

I had wanted to fulfil my last duty to Uncle James by completing his book. But nowhere, not even on application to his publishers, could I discover a word about it.

At last peace settled upon the house, and two evenings after the workmen had departed I sat after dinner sewing in the drawing-room. It is poor work sewing alone. The world was very quiet. The loudest sound was my thread drawing through the stuff I was sewing, the next the shifting of the fire. In the chair opposite me the fox-terrier lay asleep. I heard all the bells of the town tell ten o'clock. Downstairs a door slammed and I heard the maids pass up to bed. Then utter silence again.

I finished my seam, folded it on my knee, and sat staring into the drowsy fire. Presently I started and felt a burning wave of heat, followed by stiffening cold, pass over me. I looked up. Nothing but the dog growling softly. He had waked from hunting in dreams, and was staring fixedly at the wall by the writing-table and growling to himself. I rose and let him out into the dark empty passage, took a book at random, and started to read. It was too early to go up to bed yet. It was a treatise on English prosody. I opened at a page of specimen passages and read:

> I am fire and air; my other elements
> I give to baser life.

A little base *earth* still clung to me, and I fixed my attention to the book, and read on:

> And there is nothing left remarkable
> Beneath the visiting moon.

A very cold wind blew in the room and chilled my hands. The windows were shuttered and the door was shut, but I sat over the fire rubbing my chilled hands without effect. From the chair opposite me the dog sighed heavily.

Then I remembered that I had let the dog out of the room.

What followed I do not attempt to extenuate. I rose quite quietly but firmly, flicked out the lights, and walked straight upstairs to bed, looking neither to the right hand nor to the left.

VII.

The next two days were devoid of any event. I sat in the garden, in the library, in my bedroom, and not until I woke to a wet morning on

the third day did I realise that the shadow was drawing near again.

By night I felt sure I should know more. The rooms looked spectral in the waning light of a wet afternoon. As I came into the drawing-room at dusk to ring for lights and tea, I thought the hour of realisation had come. I heard furtive footsteps as I turned the handle of the door, and could have sworn that some one left the room by the opposite door as I came in.

My maid came up with tea, and lit the candles on the mantelpiece. 'There 's two cups on the tray, miss. I put them out, thinking the gentleman might be staying to tea.'

I had told her that I was not at home to anybody except two—Isabel Vane, whom I could not well refuse, and another who might come to Lostminster, but had not.

I sat down to tea, the empty cup opposite me. It looked rather sorrowful in the mixed candle-light and fading daylight.

'Did the gentleman let himself out?'

'He must have, miss. I stood by on the stairs to let him pass, and he passed down quiet like, as if he didn't see me.'

'That 's all right, then. No doubt he let himself out. He knows the house,' I said.

But I was not feeling composed. Among other feelings I recognised a real annoyance. I had taken some trouble that these new servants should hear no tales. Goodyear, I felt sure now, had known what it was he saw. If these women knew, they would go. My bad temper steeled me against all fear that night. The dog came in to offer to sit with me, looked round, dropped his tail, and asked to be let out.

I let him out, and came back into the stunned silence of the room. It was not pleasant sitting there alone. But although I sat reading over the fire until after twelve, I was not disturbed. By twelve-thirty I felt that further waiting was vain. The shadow—the feeling of anxious expectation, of future hours of bitter struggle—hung over the house like a pall. If it had been set in lonely meadows it could not have seemed more remote from time. Old sorrows, old unforgiven sins—that was what haunted it. There was nothing that I could see. I put away my book, and as I reached the door I heard footsteps—too heavy for a dog, but too light for a man—moving away from the door down the dark passage and staircase. It seemed to me as if some one had been standing outside the door waiting and watching, and had gone away in disappointment.

VIII.

May came to Lostminster. The damp, rich country round the river and up beyond the canal began to show flowers, and the chestnut-trees lit their hundreds of white candles. I walked out alone miles into the country, and turned home every night to find the shadow still awaiting me. A couple of invitations from friends in the outside world affected me oddly for a moment or two. In their letters I read a growing curiosity over my long silence. One of them even threatened to descend upon Lostminster to stay with me and see my house. I wrote rather a hostile note in return, and settled back to my silence.

I had begun to wonder how much longer it was to last, when the end came suddenly. I came back from a long walk in the country after tea-time.

'Miss Vane called this afternoon, but I told her you were out, miss,' said the maid when she came upstairs to close the shutters. 'The gentleman who called before was standing just behind her when I opened the door, but he heard what I said, and went away too, without leaving any message or asking for you.'

'I am sorry to have missed them,' I said.

The girl looked at me, hesitating a little, and then said, 'It seems queer, miss, but when I came in just now I didn't speak, for I thought I saw the gentleman in here with you, standing just behind you, too.'

I turned round rather quickly. I was sitting at the writing-desk addressing an envelope, and I must confess that it shook me a little to think that some one had been behind me looking over my shoulder in silence until the girl entered. 'No, I didn't meet him,' I said. 'Let me know if he comes again; and if I 'm out, let him come in and wait for me.'

It was a beautiful night. I fell asleep thinking of the old trees and the sleepy meadows by which I had been walking that evening, and I dreamt that I came home to find John Wonnacott sitting in front of the empty fireplace in the drawing-room. I saw him—a gray figure turned away from me—get up as I entered the room and turn his head slowly until his eyes met mine. There he stood, spare, rather shrunken, and looking very ill, his black eyes profound with knowledge of old sorrows and wrongs. I spoke to him, and he answered the same word over and over again. All mortality seemed to drop from me, and I could almost hear what he was saying. 'Speak louder,' I said. 'What is the word you are saying?' But he shook his head, walked past me suddenly, and I did not see him pass down the staircase or find him on the balcony.

. . . . . .

I woke up, lit a candle, and went downstairs to the drawing-room.

It was almost dawn. I drew the curtains and opened the windows on to the balcony. From the court below there came no sound. I looked into the darkness, but saw no face and no straining eyes.

Then I searched the writing-desk, flinging papers in heaps on the floor until I came to what I was looking for. In the large drawer,

full of stamped note-paper and envelopes, was a parcel the same size as the rest. In it was the manuscript of the book my uncle had completed just before his death—the Wonnacott letters.

I sat reading until the bright sunlight of a May morning stole into the room and lay in pools on the untidy floor.

As I neared the end some words leapt at me out of the page, as one's own name leaps at one out of a column of type.

'Reputation—reputation,' wrote John Wonnacott. That was what he had been saying, then. 'Reputation.' My uncle's labours had given back to John Wonnacott his name untarnished. You may read the details of it for yourself in his book, in the deciphered letters.

I took a morning train up to London and saw my uncle's publishers. I stayed two nights in London, and then returned home again.

Home—it was that now. The hall was full of flowers, and the evening sun burned on the strong colour of the blue curtains.

I gathered up my letters and went up to tea on the balcony.

'Has anybody called?'

'Miss Vane this morning. She said she would call again after tea, miss.'

'No one else?'

'No, miss—not since you went.'

. . . . . .

I do not know what I had expected to find awaiting me that evening, but certainly not what I found in one of the letters I was idly tearing open—one that closed the doors of Friar's Entry suddenly behind me.

I was married five weeks later, and accompanied my husband out to South Africa. It was a question of leave, but I had no relations to consult, and I had never cared for clothes, so I was ready. Friar's Entry we managed to let the week before we sailed.

The new organist of Lostminster has lived there two years now.

I hear no complaints.

THE END.

THE ROMANCE OF THE REDWOODS.

WE are all familiar with the advertisement poster of 'Big Tree' wines, picturing a wagonette full of sight-seers passing out of a square archway cut through the living bole of a mighty tree. How many among those who see this advertisement are able to name this tree, or the country in which it is found?

What they see is a very small part of a *Sequoia gigantea*, one of the largest growths that have ever sprung from virgin soil. The *Sequoia gigantea* is a relation of the *Semper virgens* or the giant redwood of California. This tree is the largest of the conifers, forming one of several surviving links between the firs and the cypresses.

The *Semper virgens* grows to an enormous size. Picture to yourself a graceful, tapering tree as tall as the London Monument; that is the height of an average Californian redwood. The tree that you have imagined would have a diameter at its base so great that you would have to take four strides in order to pass it.

Imagine another tree of the same kind, but half as high again as the first; then you have some idea of the height of a large redwood. Its length would be three hundred feet, and to pass the trunk would require at least six walking-paces.

The bole of the redwood is gracefully fluted, reminding one of the columns supporting the roof of a cathedral. At its base the great roots rear like buttresses, and about them grow the huge ferns without which these trees are rarely found. Under foot is a carpet of cones and needles that was woven in the loom of centuries.

Once the redwood covered nearly half the continental surface of the earth, but now it is to be found in its primitive growth only in California and Oregon, whither it has been driven by the advancing ages.

It is almost impossible to realise the antiquity of such trees without the aid of comparison. Many people have at some time in their lives seen the ruins of Hastings Castle, yet a tree similar to those I have described would have been old when Hastings Castle was built. That castle, now a ruin, dates back to the Norman Conquest, but the tree would be living still. There are acres of such trees in California.

Think of a forest, hundreds of miles in length, composed of tapering giants as high as the London Monument, beneath them the great ferns, growing in the dim, twilit aisles, silent as night in a deserted cathedral. To walk among such trees is to learn a lesson in humility not easily to be forgotten.

Nor have you yet seen the greatest of the redwoods.

If you would look upon the *Sequoia gigantea*, it is to be found in Sierra Nevada, between four and five thousand feet above the level of the sea. Here are at once the largest trees in the world, and the oldest living things in existence.

Picture to yourself a tree as high as St Paul's Cathedral. That is the *Sequoia gigantea*; to pass it would require ten walking-paces.

There is a famous group of these trees in California known as the Mammoth Grove of Galaveras, which contains nearly a hundred of these monsters. One of the prostrate trunks here was found to measure ninety feet in girth

at a point *one hundred yards* from its base. This colossal tree was in all probability over a thousand years old at the beginning of the Christian Era; at the time of its fall it had lived through nearly thirty centuries

There are living trees in Sierra Nevada and Oregon to-day the age of which varies between five hundred and two thousand years, some of them even more. These monsters have outlived empires, and have centuries yet to live.

'PASTE.'

I.

MERRIMAN was strolling down Wardour Street in that amiable frame of mind which on a sunny afternoon in spring-time not infrequently envelops elderly gentlemen who are well fed, well clothed, and live well within a comfortable income. To such individuals Wardour Street is a place of bargains—the hunting for which may profitably occupy any spare hour of the day. It is not an environment of lost hopes and desperate resolves. Its stuffed and glittering windows are not eloquent of tragedy, privation, and vanished dreams. It is only a quiet corner in the roar of London, where the shrewd eye may detect an alluring bit of jade or enamel, a Tanagra figure, or some other trinket of beauty or worth. Wardour Street has nothing to say of the future, but it is eloquent of the past.

Merriman walked slowly, a portly, blue-eyed, red-cheeked man of about sixty, the sort of man whose cheque would be accepted instantly—and anywhere. He did not need anything, but was rather curiously conscious just at this moment that others did. The thought was in his mind when his eye fell on a bloodstone ring in a strangely carved setting. He loved semi-precious stones, and stared at it with sudden interest. Simultaneously he became aware of a young man who walked slowly past, glanced at him quickly, went on a few yards, halted, pivoted on his heel in military fashion and came slowly back. Indecision was written on his lean, tanned face. Merriman looked at him impersonally and went into the shop.

It was small and rather dark. The pawnbroker recognised a probable customer. 'Can I show you anything, sir?' Then, with an appraising scrutiny, 'I've got a nice bit of Sèvres at a very low price.'

Merriman shook his head. 'I'd like to see that bloodstone ring in the window.'

It was dropped into his palm. He was peering at the two tiny gold dragons that formed the mounting, when the doorway was darkened. A moment later sounded a voice. 'What can you let me have on this?' The words came out jerkily, as though forced: a tense, uneven, young voice—distinct even in its stress.

'What is your name and address?'

Merriman stole a look out of the corner of his eye. The young man was close beside him, and held out a brooch—Victorian in its design—with five rather large diamonds in the centre and radiating spikes tipped with small pearls. It suggested memories of embroidered fire-screens and grandfather clocks. The man murmured his name and address—which Merriman did not catch—and waited, moving restlessly, with a tightening of the lips and a rising colour under his tan. The pawnbroker screwed a magnifying-glass under an untrimmed brow.

'H'm,' he said presently—'I don't know that I can do anything.'

A pair of brown eyes opened wider. 'Why?'

'This may be paste. I——'

'But it isn't. It can't be!'

'Anything can be nowadays—and in Wardour Street. If it is, it's good paste—they made great stuff fifty years ago.'

'But it's been in the family for nearly that. In fact'—here the voice grew rather desperate—'I know it's all right. It—it was a present.'

The pawnbroker pushed the trinket across the counter. 'What you know and what I think are two different things. Give it the benefit of the doubt and call it genuine—but I don't want it—at that.' He turned to Merriman. 'Now this ring is all right; no paste about it. You can have it for five pounds—and I'll give you four pounds ten for it any day.'

Came a short exclamation and the doorway darkened. Merriman counted out five pounds and slipped the ring into his pocket. The pawnbroker nodded.

'We get a good deal of that sort of thing,' he said, jerking his chin towards the street. 'Surprising how little some people know about their own stuff. If it were genuine, that brooch would be worth two hundred pounds.'

II.

Merriman went out. Twenty yards away stood the young man, staring aimlessly towards Leicester Square. His shoulders were hunched up, his hands thrust deep in his pockets. Merriman noted that his clothes were much worn but well cut. The head was rather small and held erect, the back was straight, and about the whole figure was something that suggested a racehorse of good strain. This youth was not a spendthrift or a waster—but how did he get that brooch? Presently the young man turned, and saw Merriman. His face was pale; his brown eyes were very bright.

Merriman felt a throb of pity. If he had had a son himself, he would have liked one who was

built after this fashion. He gave way to an unaccustomed impulse and stepped forward. 'I'm afraid you were disappointed?' he ventured.

The young man stared and nodded. Quite obviously he was wondering what business it might be of this stranger, but, equally, the stranger's eyes were so honest, his appearance so satisfying, and his manner so sincere that there was nothing to which he could take exception. 'Yes, I was,' he admitted.

Merriman liked his eyes, brown and clear as forest pools in autumn. But now they were restless with apprehension. 'Then it was very important?'

'For me—yes, certainly.'

Merriman paused, feeling that he was on the edge of an action quite unpremeditated, but nevertheless, under the circumstances, entirely natural. 'Will you come and have tea with me?'

The young man smiled, as only youth can smile, and nodded. Ten minutes later they settled down in a favourite warren of Merriman's off Shaftesbury Avenue. Conscious of the thinness of his guest's cheeks, he ordered lavishly, and presently surveyed him across a mountain of toast, muffins, and cake.

'Tea is my great meal of the day,' he said amiably. 'By the way, here is my card.'

The stranger took it. 'I—I haven't a card with me. My name is Forbes.'

'Any connection of the Sussex family?'

'Distant only. My father is dead—years ago. My mother and I live together—off Old Compton Street.'

Merriman nodded. 'Would you care to tell me anything about—well—this afternoon? I'd like to assure you that I'm really interested, and not merely curious. I might be of use.'

The young man flushed. 'I'm a perfect stranger, sir.'

'Just so. That makes it all the more interesting. As a matter of fact, my friend, I'm beginning at my advanced age to realise that the things of this world are rather unevenly divided. Has that never occurred to you?'

Forbes made a little gesture. 'It did—in France—several times a day. Now that I've got back, I pinch myself, and ask if this is the England I'm supposed to have fought for.'

Merriman leaned forward, a softened light in his blue eyes. 'There are others among you who ask that.'

'Several hundred thousand, and there's no answer yet.'

'I'm afraid that's true. Now will you tell me about this afternoon?'

Forbes gulped at his tea and burned his throat. 'That is, tell me as much or as little as you feel inclined.'

There was a little pause; then the young man began, untinged with resentment or revolt, but burdened with a sort of wonder that such things could really be. 'I got back six months ago, and found my job filled. It had been filled for four years. It was the old story of army life unfitting one for civilian duties—that's the way they always put it. I wore out my boots to no purpose. Always the same thing: very sorry, but—— Then last month I ran into some of my own crowd—London Scottish; they were buying army lorries at two hundred each, and forming a syndicate—a transport syndicate. There's lots of work in sight. I had some of my gratuity left, and needed a hundred pounds more to join. It looked well to me, for, you see, our crowd had been through—that is, we'd all been on the same job in France.' He broke off in sudden gloom. To Merriman it seemed as though he wanted to be back on the old job again, with the old crowd.

'Yes?' said Merriman interrogatively.

'So I talked it over with my mother. I was a bit desperate, and suggested pawning the brooch. It's the only thing of any value we have left. She wanted to help if she could, but the idea of going to a pawnbroker seemed to frighten and horrify her. I didn't say anything more, but put the thing in my pocket this morning. You know the rest; but what she will do if she hears it's paste puts my wind up. She mustn't know. That's all there is to it.'

'And what about you?'

'I'm not thinking of that, sir, at the moment.'

Merriman pushed out his lips. He had really felt so little for the last few years since he retired from business that it was difficult for him at first completely to visualise the situation. It had meant nothing particular to him that other people felt, and felt deeply. He had almost prided himself—at one time—on his immunity from any sentimental reaction, and complacently regarded his forty years of adult life as a period which had been safely traversed without incurring any entangling responsibilities. But now, as he looked thoughtfully at young Forbes, it began to appear that he who steers clear of responsibility also sails past a lot of delightful promontories and bays and harbours, the intimate knowledge of which—even though it be attained at some cost—adds notably to the pride and privilege of life. He wondered mutely what it would be like to have such a son as this—to experience the communicable thrill of his hopes and emotions. He nibbled a cake and spoke thoughtfully: 'You would be quite right to keep your unpleasant discovery from your mother. Tell me more of this business venture.'

Forbes told him how the men were experts in transport; how the lorries had been bought at low prices—all except the one he was to buy; how they could do their own repairs; how contracts already offered; how, with the cars, they had secured a supply of spare parts—till Merriman, listening shrewdly, perceived that it was good business, and, backed by youth and enthusiasm, should win out if wisely managed.

'But I suppose I'm out of it now.' His guest made a grimace. 'Do you happen to know, sir, of any one who wants a good clerk?'

'Yourself?'

'Yes.'

Merriman shook his head. 'I can't quite see you at a desk. Might I—is it possible I could have the pleasure of a chat with your mother?'

Forbes smiled wistfully. 'She's a very proud old lady, and while you're awfully kind, I——'

'I wouldn't think of suggesting anything that would hurt her pride. Can you keep your secret? I mean about the brooch.'

'Of course I can.'

'Then I can keep it too. I may be able to put something in your way more suitable than a clerkship. And, please don't misunderstand me, but I've never liked any kind of acknowledgment. It has recently become quite clear that if one can do a good turn, one is doing as much for one's self as for the other fellow, so why any acknowledgments?'

Forbes put down his cup rather shakily. 'I'm quite answered. Shall we go along now?'

III.

Twenty minutes later Merriman was admitted to a tiny room at the top of two pairs of narrow stairs off Old Compton Street. Forbes had run up ahead to prepare the way. In one corner sat a little old lady with snowy hair. She had a small, delicate face, and her skin had taken on a certain smooth transparency that gave it a tinge of old ivory. Her eyes were of a faded china blue, the curve of her lips still beautiful when she smiled. Merriman, as he was introduced, thought he had never before seen age presented in such charming and self-possessed fragility. The room was furnished in the cheapest manner possible, but the contrast between her and her surroundings held only for an instant. No material thing could flout the grace of her dainty presence. She received him without a trace of surprise and all the dignity of bygone days. Merriman was reminded of powder-rooms, crinolines, and minuets. Forbes presented him and vanished.

'My son tells me that he has had tea with you,' she began in a silvery voice.

Merriman nodded. 'I had that pleasure.'

'One of the great differences between his day and mine is that friendships are now very quickly formed. I trust, however, that he did not speak to you first.'

'Not at all,' Merriman assured her. 'I was much taken with him'—he hesitated a moment—'and asked him on sheer impulse.'

She nodded contentedly. 'Do you happen to be in the business which Rupert contemplates? He told me you discussed it with him.' A suspicion of colour had bloomed in the faded cheek.

'No. I retired from business some years ago, but what he told me sounded quite promising.'

She looked at him gravely, as though deliberating how much or how little to say, then smoothed an imaginary wrinkle from across her knees. The movement of the waxen fingers suggested that in her mind was another wrinkle she was mutely trying to obliterate. She looked up with a quick, bird-like glance. 'Are you married, sir?'

'No,' said Merriman; then, quite without volition, he added 'unfortunately.'

'Rupert's father was killed ten years after my son was born—in Afghanistan. Since then Rupert and I have been everything to each other. Not being married yourself, it would be hard for you to realise just what a responsibility it has all been. There is much that a boy can share with his mother, and much that he cannot share. But what I have known has kept me from worrying about the rest.'

Her visitor nodded. 'He struck me as being a very fine chap.'

Her eyes grew soft. 'You think this business venture should do well?'

'I do.'

The aged face became suddenly agitated. Merriman, waiting quietly, perceived that a storm of feeling was mounting in her withered breast. Presently she sent him a long, questioning look and made a little helpless gesture that moved him profoundly.

'Rupert is intent on joining his friends. It is natural; they know each other. As he puts it, they have paid to know. I never ask him about those four years, because he only said—the first time—that it wasn't pretty, and I couldn't understand. But he came through safely, and I was very thankful.'

Merriman did not speak. Presently she went on: 'When he got back he was full of enthusiasm at seeing England again. Now'—here her thin voice trembled—'I think he hates England, and that's a dreadful thing. Then, at last, came this chance of which you know. We talked it over, and, being desperate—and having less than a hundred pounds when he needed two hundred—he suggested pawning my brooch. It shocked me that he should even have——'

She broke off, a deep appeal in her tired eyes. 'You will tell me, sir, if I am making a mistake in speaking of these things.'

Merriman leaned forward, and, daring greatly, touched the waxen hands. 'I think you are doing the very best thing. I want to know.'

'Well,' she resumed after a tense moment, 'he said nothing more about it; but to-day I missed it—and knew what had happened. Oh—do you know whether he tried to dispose of it?' Her eyes were dark with inward pain.

Merriman did not answer at once, but knew that he could not look into that face and lie. Mrs Forbes was on the edge of her chair, pulling weakly at her handkerchief. It struck him that she was using up her reserve of vitality at an

appalling rate. Then, with a sense of hopelessness, he told her the truth; hopeless, not because he did not know what his part in all this would be, but because of the blow he was inflicting in shattering what he conceived to be a dream of happier days. She stared at him, her lips moving soundlessly. He had not imagined it could be as hard as this.

'Of course, the man may have been mistaken,' he concluded.

'You told me that you had never married, sir,' she said slowly, 'so perhaps it will be difficult for you to understand. It was pride that took my son to France—pride, I think, that kept him safe and straight—pride that helped him through these last six months. You see, that's all I could do for him—encourage his pride. But now——'

Merriman shook his head. 'Pride is not so easily broken if it's the real thing. It's not your fault that the brooch was paste.'

'I knew it was paste,' she whispered.

'Then who sold the original—if there was one?' he asked, astonished.

'I did. To help with Rupert's education. I was alone then.'

Merriman got up as though lifted out of his chair. He stood looking down at her. Two small glittering drops—which were not paste—had appeared on the waxen cheeks, and her eyes met his with a soft appeal, as though beseeching him not to blame her. For a moment he could not speak.

'You dear lady—you dear, brave lady,' he said under his breath.

'You see,' she went on, dabbing at her cheek, 'I couldn't tell Rupert—it would have hurt his pride. It seems to me that that is one of the penalties of love, when we have to do things that hurt us for the sake of those we love, and at the same time screen our dear ones from any knowledge of what is going on—lest it cloud their sky. I suppose that later on they do such things themselves, and then, perhaps, their thoughts travel back—and that must be our reward—a remembrance that is possibly a little more tender. Do you not think, sir, that it must be so?'

Merriman got rather red. This was unfamiliar ground. He could not recollect having done anything for the sake of memories—tender or otherwise. Then, much to his surprise, he heard his own voice. 'If I were your son, madam, and learned all this, it would make me feel that—that I couldn't do enough in return. It would give me more pride than ever.'

She sank back in her chair, her lips parted. 'You think so?'

'I know it,' he said with utter conviction.

They looked at each other silently for a moment, he with the dawning knowledge that her life had been one of what he once would have called altruism, but now recognised as sacrifice and love and a high beneficence; she at this stranger who, treading paths so different from her own, had suddenly lifted a cloud of apprehension beneath whose shadow she had lived for twenty years. They were revealers—each for the other. Merriman smiled. 'You can keep a secret, madam?'

She lifted her head in a movement amazingly like that of her son. 'I have kept one for twenty years.'

Merriman's smile broadened. 'Then I would beg that you display no surprise at anything that may take place within the next twenty-four hours. Your son tells me he has that period within which he may join his friends.'

She searched his face, but found there only an honest goodwill. She was about to speak, then seemed to recognise the futility of thanks. Thanks for what? She was terribly afraid of taking anything for granted. Merriman got up. 'May I come and see you again?'

She pulled herself together in an instant. He got a glimpse of what she must have been fifty years before. Now she was a dainty reminder of that past in which he seemed to see her move—admired, sparkling, a thing of beauty, delicacy, and charm. And he was somehow assured that all these attributes had survived, rarefied by the cold winds of age, ennobled by the unyielding strength of her love.

'I shall be very pleased,' she said with a glance that was almost coquettish. 'It is nice to meet new people—especially a new man.' She extended a small hand.

Merriman bowed over it, and, in sudden impulse, touched it with his lips. The pink spots reappeared in the waxen cheeks.

'It is many years since that happened last,' she murmured.

. . . . . .

At breakfast next morning young Forbes tore open a letter. He scrutinised it dully—taking it to be a final notice that the day of opportunity was about to expire—then stared with quick interest. His mother put down her cup—untasted.

'What is it, Rupert?' She was conscious of a fluttering in her pulse.

'What an extraordinary thing! Listen.'

'"Wardour Street, London.

'"Dear Sir,—With reference to your visit yesterday, I would like to say that shortly after you left a brooch was brought in much like yours. At first I took it to be paste, but, examining it with care, found it to be genuine. It is quite likely that I was mistaken in yours as well, and I write to say that if you will bring it in again, we can probably do business. In this case I would advance, say, two hundred pounds on yours.—Faithfully yours, J. Blanton.

'"Mr R. Forbes."'

CHARLES DICKENS ON LAW AND LAWYERS.

By an EDINBURGH LAWYER.

I.

THERE is, I am afraid, abundant evidence throughout Dickens's books that he detested the law and disliked lawyers. Why he did so is not, perhaps, so clear. One may surmise that his broad mind and generous heart rebelled against the precision and inelastic rigidity of law; that he would scorn to accept the maxim 'Hard cases make bad law,' and was only alive to the apparent injustice of those hard cases which must needs occur sometimes in the best-ordered system of legal administration. We know that the methods of the 'Circumlocution Office' and others were not to his mind, and that he rode full tilt against the Bumbledom and squalid cruelty of the Poor Law, as it was worked in his day. Again, there was the law of imprisonment for debt when Dickens wrote; we find graphic pictures of Mr Pickwick in the Fleet, and of the Dorrits in the Marshalsea, to say nothing of the minor tribulations of Mr Micawber. These things cut Charles Dickens to the soul, and he wrote vehemently, and not without effect, in their denunciation.

But it was the English Court of Chancery that he regarded with a particular and undying hatred. His brief preface to *Bleak House* contains a withering indictment against it. There the author deliberately states that 'everything set forth in these pages concerning the Court of Chancery is substantially true, and within the truth. The case of Gridley is in no essential altered from one of actual occurrence, made public by a disinterested person, who was professionally acquainted with the whole of the monstrous wrong from beginning to end. At the present moment' (August 1853) 'there is a suit before the Court which was commenced nearly twenty years ago, in which from thirty to forty counsel have been known to appear at one time; in which costs have been incurred to the amount of seventy thousand pounds; which is *a friendly suit*; and which is (I am assured) no nearer to its termination now than when it was begun. There is another well-known suit in Chancery, not yet decided, which was commenced before the close of the last century, and in which more than double the amount of seventy thousand pounds has been swallowed up in costs. If I wanted other authorities for *Jarndyce and Jarndyce*, I could rain them on these pages. . . .'

What I have quoted is dismal reading. I do not believe that legal proceedings of such disastrous character as those referred to were ever possible in Scotland. I do not suppose they are possible in England to-day. But we have Dickens's word for it that they did occur there, not so very long ago. We may hope that the great writer was misinformed; but it is small wonder that, believing what he did believe about the Court of Chancery, his righteous indignation should have bred in him a detestation of the law in general, and all its works and ways. His own personal experience in Chancery, in connection with attempts to pirate some of his writings, was such that, in a letter to Forster, he says: 'It is much better to suffer a great wrong than to have recourse to the much greater wrong of the law,' and complains that 'in asserting the plainest right on earth, I was really treated as if I were the robber, instead of the robbed!' All these may have been contributory elements. Certain it is that Dickens lost no opportunity—and he created many in his various books—of denouncing the law as a cruel, tricky, tortuous, and dishonest affair.

The individual lawyers, too, whom he portrays—and there are many of them—form, with hardly an exception, an unlovely company. Dickens is hard upon lawyers. Perhaps he had known too few of them, possibly too many; but I think that those whom he met must have been the wrong sort—that there is a right sort among lawyers, as among any other class of men, can hardly be disputed. Yet one would scarcely suppose so, if the lawyers of Dickens were the only available field for contemplation or selection. Let us glance awhile at some of his types of legal character and personality.

II.

At the top of the legal tree sits the Lord Chancellor. In the opening chapter of *Bleak House*, on a raw day of 'implacable November weather' and densest fog—a 'London particular,' as Mr Guppy called it—we find a Lord Chancellor 'hard by Temple Bar in Lincoln's Inn Hall, at the very heart of the fog, sitting in his High Court of Chancery, with a foggy glory

 [*All Rights Reserved.*]

round his head, softly fenced in with crimson cloth and curtains, addressed by a large advocate with great whiskers, a little voice, and an interminable brief, and outwardly directing his contemplation to the lantern in the roof, where he can see nothing but fog.' The picture is gloomy and unpromising. It is pleasanter to find that his lordship, on leaving the court, and coming to interview 'the wards in Jarndyce' in his anteroom, appears as an English gentleman, shrewd, courtly, affable, and kind; and that his manner, in talking to young Richard Carstone, seemed 'as if he still knew, though he *was* Lord Chancellor, how to go straight to the candour of a boy.' Yet it is the portrayal of his lordship in the bewildering fog, and not in his disrobed moments of courtesy, that abides, and was meant to abide, with the reader. For, as was pithily observed by the immortal Short (*alias* Trotters), who, in partnership with gloomy Codlin, conducted Mr Punch and his associates through the west of England, 'Would you care a ha'penny for the Lord Chancellor, if you know'd him in private and without his wig? Certainly not.'

This sound observation forbids us to do more than just refer to the faint aura of another, a 'deceased,' Lord Chancellor, whom we are only permitted to know by the hearsay evidence, so to speak, of Mr Solomon Pell, that shady practitioner in the Insolvent Court, in whom the elder Weller and his comrades, including 'the mottle-faced gentlemen,' placed their confidence —subject, however, to the undoubted right and capacity of the 'umpires' to 'be wery soon down upon him if he comes anythin' irreg'lar.' The *dicta* reported by Mr Pell are not without interest. For example: 'I 'm completely sewn up, as my friend the late Lord Chancellor many a time used to say to me, gentlemen, when he came out from hearing appeals in the House of Lords. Poor fellow! he was very susceptible of fatigue; he used to feel these appeals uncommonly. I actually thought more than once that he 'd have succumbed under 'em; I did indeed.' And again, '"Pell," he used to say to me many a time, "how the blazes you can stand the head-work you do, is a mystery to me." "Well," I used to answer, "I hardly know how I do it, upon my life." "Pell," he 'd add, sighing, and looking at me with a little envy—friendly envy, you know, gentlemen, mere friendly envy, I never minded it—"Pell, you 're a wonder, a wonder." Ah! you 'd have liked him very much if you had known him, gentlemen.' But these glimpses into the inner life and sentiments of a departed luminary are, alas! but hearsay—and the totally unveracious hearsay of Mr Solomon Pell at that —and may, therefore, be discarded as a serious contribution to the matter in hand.

There is one judge—not, indeed, a Lord Chancellor—who should not be passed by in silence, before we leave the topic of the Bench for that of the Bar—the 'little judge' whom every one remembers as presiding at the trial of *Bardell* v. *Pickwick*. His sapient injunctions, 'You had better be careful, sir;' 'You must not tell us what the soldier, or any other man, said, sir; it is not evidence;' his somnolence at times; his strictly impartial, if not illuminating, charge to the jury; his two little turned legs, little three-cornered hat, two queer little eyes, one broad pink face, and big and very comical-looking wig—all these things we remember and delight in; but they are not directly relevant, though perhaps they are so indirectly, to the inquiry as to Dickens's views upon law and lawyers.

III.

Let us descend, without further parley, from Bench to Bar. I suppose that most people, if suddenly called upon to name a barrister from Dickens, would almost instinctively say, 'Oh, Serjeant Buzfuz.' Who, indeed, that has ever read that inimitable trial scene in *Bardell* v. *Pickwick*—a caricature be it, but drawn with what a pen!—can forget the serjeant? A big, burly, red-faced brute of a man, but past-master in the sorry art of fudging a common jury. I have always entertained a doubt whether his 'brother' Snubbin was really the equal of Buzfuz for the particular job in hand. True, the enthusiastic Perker declared him to be 'at the very top of his profession. Gets treble the work of any man in Court—engaged in every case. You needn't mention it abroad, but we say—we of the profession—that Serjeant Snubbin leads the Court by the nose.' Oh glorious and enviable Snubbin! Yet his lineaments, according to 'Phiz,' and the description of him, lantern-faced and sallow-complexioned, with thin weak hair, and a 'dull-looking, boiled eye'—I do not like that eye—fail to inspire confidence; and the summary of his address to the jury is not impressive or convincing; although 'he did the best he could for Mr Pickwick; and the best, as everybody knows, on the infallible authority of the old adage, can do no more.' But I dare say that, under the circumstances, poor Snubbin had not much chance for effective display of his talents; and, after all, he did have the astuteness to 'wink' (however fruitlessly) at his unfortunate junior, Mr Phunky (or Monkey, as the little judge preferred it), with hope of stopping his colleague's irregular cross-examination of Mr Winkle, before it culminated so disastrously both for the witness and for the cause of Mr Pickwick.

The *Tale of Two Cities* shows us Mr Stryver, an objectionable bully of the Buzfuz type, only this time at the Old Bailey, as he 'shoulders' himself into prominence and promotion by the sheer force of callous egotism, supplemented by the brains of his jackal, Sydney Carton, whose talents were worthy of a better use. None of

these men—unless Carton, who can scarcely be counted among effective barristers—is of a likeable type.

In *Little Dorrit* there is a masterly sketch—it is little more than a sketch *—of another sort of barrister, but it, too, is drawn in no amiable spirit. The man has no name in the book; he is alluded to simply, or rather generically, as 'Bar'; but his 'little insinuating jury droop,' his 'persuasive double eye-glass,' and his methods of weaving webs for the confounding of jurymen are bright touches in the narrative. One feels that one knows that man, all nameless as he is; but he is not a man whom one would care to know very well. I like better to think of Traddles, dear Tommy Traddles of the upstanding hair; but then, though he is, by way of exception, lovable as a man, it is difficult to believe that he was much use as a barrister; still more, though we have the author's word for it, that there was really talk latterly of his being made a judge. Other barristers pose in, or flit through, the pages of Dickens. Of 'Mr Prosee, the eminent counsel,' we know no more than that, on one occasion, he dined with Mr Perker, at what is said to have been 'an agreeable little dinner-party.' But I do not believe he contributed to its gaiety; his name forbids the supposition; I fancy him a dryasdust, Chancery sort of man. *Paulo minora canamus.* Let us turn from Dickens's barristers—we can leave them without a pang—to his presentations of the other branch of the profession. We shall not fare much better.

IV.

Dickens's solicitors make a fairly numerous crowd, varying in position and qualifications, but many of them are disagreeable, if not repellent, personages. At the top of the list it is but meet to place Mr Tulkinghorn of 'the Fields.' A strange personality his, with a special flavour, and something of a fascination of his own. One hears much, in these days, of supermen; Tulkinghorn is, in his way, a super-solicitor. Not, we may suppose, one in what is called large general practice, for it seems that he has but one clerk, who occupies a sort of 'pew in the hall' of his employer's premises; yet 'he is reputed to have made good thrift out of aristocratic marriage-settlements and aristocratic wills, and to be very rich.' The rusty old man's strong point is the 'mysterious halo of family confidences' which surrounds him; confidences, moreover, of families among the highest in the land, in whose houses he has an intimate footing, as, for example, in Sir Leicester Dedlock's mansion in town, and at Chesney Wold, the 'place in Lincolnshire' of that heaven-born baronet. The great Sir Leicester 'is always happy to see Mr Tulkinghorn. There is an air of prescription about him which is agreeable to Sir Leicester; he receives it as a kind of tribute. He likes Mr Tulkinghorn's dress; there is a kind of tribute in that too. It is eminently respectable, and likewise, in a general way, retainer-like. It expresses, as it were, the steward of the legal mysteries, the butler of the legal cellars, of the Dedlocks.' A man like this is plainly out of the ruck of solicitors; he must have a shelf, or a pinnacle, for himself, and rest there solitary. Trustworthy, respected, feared, but not a man you could ever get to know, still less to like, or love—you might as well try to know the Monument, or the North Pole. No reader of *Bleak House* has ever, I imagine, grieved over the murder of the inscrutable old man—he is not human enough for that; but there is real tragedy in the sudden ending, by one tiny leaden bullet, of this man of knowledge, pride, and mystery.

From Mr Tulkinghorn of 'the Fields' to Perker of Gray's Inn is rather a drop; but in the latter we find at least something more akin to human nature and to the solicitor of real life. The description of him, on our first introduction, in the inn yard of the 'White Hart,' Southwark, might, allowance being made for the altered fashion of dress, be that of some solicitor of to-day. 'He was a little high-dried man, with a dark, squeezed-up face, and small, restless black eyes, that kept winking and twinkling on each side of his little inquisitive nose, as if they were playing bo-peep with that feature. He was dressed all in black, with boots as shiny as his eyes, a low white neckcloth, and a clean shirt with a frill to it. A gold watch-chain and seals depended from his fob. He carried his black kid gloves *in* his hands, not *on* them; and, as he spoke, thrust his wrists beneath his coat-tails, with the air of a man who was in the habit of propounding some regular posers.' Rather an uninteresting little personality though, Mr Perker, when all is said; yet, within his limits, competent and a man of probity, for the laxity of his views in regard, for instance, to electioneering methods belongs to the time rather than to the man; and he had some honest and reputable clients—for who shall say that Pickwick and Wardle were not reputable and honest?—but uninteresting and unattractive, to my thinking, he remains.

If you want some one stimulating, forceful, magnetic, mysterious, you had better call up Mr Jaggers. A great man, Mr Jaggers, in his way and in his sphere; the Napoleon of Little Britain and its neighbourhood. A strong picture he makes; his large head, dark complexion, deep-set eyes, bushy black eyebrows, and strong black dots of beard and whisker; his large watch-chain and shining boots; the smell of scented soap on his great hand, and on that hand the great forefinger which he would

* Apparently drawn from life. See Forster's *Life*, vol. iii. p. 136.

alternately bite and 'throw' at his antagonist of the moment. That forefinger—it figures in his talk and in his whist-playing—reminds one of Mr Bucket's; but, then, Bucket was not a lawyer, but a detective, and belongs to another class and another story. No wonder that Mr Jaggers was regarded by those about him with profound admiration and respect, not untempered with fear. 'Jaggers is for him, Melia, and what more *could* you have?' says one woman to another. Could higher testimonial be written for any man in his position? And do not forget the 'little red-eyed Jew' whom Pip observed 'performing a jig of anxiety under a lamp-post, and accompanying himself, in a kind of frenzy, with the words, "Oh Jaggerth, Jaggerth, Jaggerth! All otherth ith Cag-Maggerth! Give me Jaggerth!"' I do not know exactly what a 'Cag-Magger'* may be; but the episode has always made on my mind, as it did on the observing Pip at the time, 'a deep impression.' Yes, Jaggers is a great fellow, but he is not lovable.

Breathless from Jaggers, and by way of change and contrast, I invoke the pale, unwholesome, simulacrum of Mr Vholes of Symond's Inn, 'a most respectable man.' Of all Dickens's lawyers, I think Vholes is perhaps the most repulsive; and that is saying a good deal. His black gloves, tight black hat, and lanky black-clad figure, his pimples, and his piety, parental and filial—for has he not three young daughters to provide for, and an aged father in the Vale of Taunton?—do their utmost, one and all, to repel one. As he sits, like a ghoul, in the stale, close atmosphere of his tiny office, his 'shoulder always at the wheel,' one comes near hating Mr Vholes; and yet he is 'a most respectable man,' a fact which Dickens takes a fearsome delight in emphasising. It is held, he points out, that the abolition of certain cumbrous, antiquated, vexatious, and expensive forms of procedure would ruin the respectable and pious Vholes and his class, and therefore cannot be contemplated, still less carried out; 'as though Mr Vholes and his relations being minor cannibal chiefs, and it being proposed to abolish cannibalism, indignant champions were to put the case thus: make man-eating unlawful, and you starve the Vholeses!' Through the medium and with the aid of Vholes, Dickens runs riotous tilt against the English law, 'the one great principle of which,' he declaims, 'is to make business for itself. There is no other principle distinctly, certainly, and consistently maintained through all its narrow turnings. Viewed by this light it becomes a coherent scheme, and not the monstrous maze the laity are apt to think it. Let them but once clearly perceive that its grand principle is to make business for itself at their expense, and surely they will cease to grumble.' I do not know how far Dickens's indictment against 'the Vholeses' may have been well founded when he wrote it; to whatever extent it was so, I hope it has been successful. In any case, let us leave the abominable, though 'most respectable,' Vholes.

It is not complete relief, but the atmosphere is less unwholesome, if we pause for a moment in the society of 'Conversation' Kenge—but he, too, has the taint of *Jarndyce* in him—or of Mr Witherden, a notary whom we meet in *The Old Curiosity Shop*; a rather pedantic, colourless person, but apparently an honest man, which is something to say for one of Dickens's lawyers. 'Honesty' is hardly the catchword which should suggest Messrs Dodson & Fogg. But let it serve; and we shall grant an interview—the briefer the better—to those two precious rascals. Unfortunately, there is less of caricature and more of reality about them than about some of the others. I am afraid that the ways and manners of their office in Freeman's Court, Cornhill, are not unknown in London and elsewhere to-day. Smart men these, but shady—very shady—and worthy of all, and more than all, the vituperative terms which Mr Pickwick would have showered upon them but for the timely intervention of his trusty body-servant. It is comfortable to reflect that the Dodsons and the Foggs go, now and again, a step too far in their nefarious ways, and are liable to be pounced upon and ignominiously struck off the rolls, to the benefit of their clients and of the world in general.

But Dickens delights to introduce his readers to types of even lower solicitors—lower, that is, in the social scale, though not much, perhaps, in moral standing—than the firm in Freeman's Court, Cornhill. We have already had a glimpse—and it is sufficient—of Mr Solomon Pell, the Insolvent Court practitioner, who was content to receive his fees subject to their taxation by Sam Weller and his friends, merely protesting that they were 'really too hard upon him'; yet we are assured that this professional job was, by very many degrees, the best he had ever had, and one on which he boarded, lodged, and washed for six months afterwards. Deeper down still in Dickens's pit lurks the egregious Sampson Brass, who, with the efficient aid of his sister Sally, carried on his dirty business in Bevis Marks. One likes to see the wretch tormented by his terrible client, Quilp the dwarf; and his final fate is fitting and satisfactory.

I have chosen, more or less at random, from Dickens's novels a number of samples—ranging from a Lord Chancellor downwards—of his men of the law. The pictures are not drawn by a loving hand. The lawyers are a poor lot. There are clever men among them, mediocre men, downright blackguards, men of doubtful probity, and a few honest men. Not many of them would one care to have as acquaintances—some, one would obviously eschew as such;

*Farmer and Henley's *Dictionary of Slang, &c.*, has 'Cag-mag: 1, a tough old goose; 2, refuse, rubbish, scraps and ends (1769).' Perhaps this may give the idea.

scarce one—unless perhaps Traddles—could one call a friend; not one among them, assuredly, is there to admire with whole heart, to love and wish to imitate. What wonder? For they are lawyers, as Dickens chose to see lawyers; servants and ministers of the law, as he saw, or thought he saw, the law—a system cruel, antiquated, dishonest, tortuous, and self-seeking. What I have written is, I think, sufficient to demonstrate the proposition with which I started—that the great author detested the law and disliked lawyers. We may wish that the fact had been otherwise; but there it is, and there we must leave it.

MAN'S WORK.

CHAPTER X.

I.

SITWELL stretched his thin legs in the Enterprise office and stared at the outline of his own feet. He was well content. It was only twenty-four hours since his return, but already there lay in front of him the draft of a circular letter to Enterprise shareholders. It stated that, while subscriptions were being received steadily, the directors thought it wise to defer active operations till the entire amount they deemed necessary was in sight. This was a matter of a few weeks.

From this he turned to comfortable reflections on Hunt's visit. He had not thought it advisable actually to examine Shanklin's property himself, and had hinted that it would be the policy of prudence if Hunt poked about unaccompanied by another visitor. To this the engineer readily agreed. On the way back Hunt had gone so far as to say that he would recommend Spencer Martin to acquire the property if possible. And this was all that Sitwell wanted. He saw himself now the accredited colleague of one of the biggest men in the industry.

His thoughts turned to Shanklin, and, pondering, it seemed to him that there was no further need for concealment. He had already got Shanklin's girl, and he expected to get Shanklin's property, for there would be no extension of the original option. Shanklin might squirm, but he could do nothing. Presently the sight of his squirming became inviting, and Sitwell got up and paced his office, smiling as he paced. The more he reflected, the more inviting it appeared. If it shook Shanklin's nerve, so much the better. At that he laughed softly, put on his hat, and started for home.

Claudia was sitting by the window. He came behind her and put his hand on her shoulder.

'Not worrying, are you?'

'No—not that. I'm wondering. I've been wondering all day.'

Sitwell had Spencer Martin's cheque for a thousand dollars in his pocket. It was marked for 'necessary expenses,' and had been handed to him by Hunt on the way back from the option. It was Martin's order, if the thing looked well.

He patted her arm. 'You needn't wonder any more; matters were never brighter.'

'You stick to what you said, Bertie?'

'Just what do you mean?'

'That whether this last project goes badly or well, you will get out of the oil business.'

He pushed out his lips. 'I hadn't met Spencer Martin then. Look at this.' He put the cheque on her knee.

She hardly glanced at it. 'What difference does this make to your promise?'

'Great Scott! it's quite certain you don't realise at all. Don't you want me to be Martin's partner?'

'I would sooner be dead,' she said bitterly.

He stared at her. 'Then you——'

'I have your word of honour,' she broke in. 'What is it worth?'

That reached him—but only for a moment. He still heard the wisp-wisp of Spencer Martin's tires on the shining avenue. It was eloquent of so much that it was difficult to express, that he put it against honour and faith and all that made life worth living. Honour had no chance. In the back of his head he knew it, but also he knew that this was the hour for temporising.

'I sha'n't be happy unless you are,' he said slowly, and meant it, happiness not being the object of his present pursuit.

She glanced at him strangely, and he went on. 'There's too much on the programme just now to settle anything. Let it stand a while. In the meantime you needn't worry about money.'

'It wasn't money.'

He felt suddenly angered. 'Is it because you married the wrong man?'

'How did you know?' she asked simply.

For a moment there was silence. The gulf stretched wide and impassable. Then Sitwell thought of Shanklin. There was an answer for all this, and he would give it to her to-morrow.

'Then pretend I'm some one else's husband, and come and have a good dinner,' he countered, unruffled. 'You might find me more interesting.'

She nodded listlessly and took out the frock she had bought in New York. She, too, was thinking of John Shanklin.

II.

Shanklin, it happened, had also asked a girl to dinner that night. It was on the way to the

city in the big car. It seemed the only thing he could do, and he frankly admitted he was horribly lonely.

Edith Winter shook her head. 'It's very nice of you, but I've a heap of things to do before I get that money; and,' she added, 'I've a feeling that there's some other girl you'd like to ask to dinner.'

'There is,' he said frankly; 'but I can't.'

'But do. I'm sure she'd come.'

'She can't, and she wouldn't. You see, she doesn't like me any more. And——'

'What a foolish virgin!' the girl broke in.

'I don't blame her. You see, I had to do something she didn't like, and—well, it's a long story.'

The gray eyes surveyed him with a suddenly sharpened interest. That photograph — that remark of Sitwell's—'disloyal and false.' Now she knew what Sitwell was, and light flooded her mind. 'Oh,' she breathed, 'I understand at last.'

She was silent for the next few miles, and when Shanklin got out of the car she gave his hand a quick, vigorous pressure. 'I'm so glad I'm your partner, and so will Jim be; only he mustn't know of it yet. And you two are so like each other that some day I'll think you are Jim, and forget myself—and it will all come right. So don't worry, will you?'

'I'll try,' he said, feeling that new courage had reached him.

'And as for Mr Sitwell—I'm not—— Oh, don't look at me like that.'

'Sorry; I was thinking of Sitwell. What about him?'

'Nothing—now. I believe I can leave that to you.'

She went off with a wave of the hand, and Shanklin, walking to his room, began to dress, experiencing a definite comfort at the touch of clean linen.

An hour later he was ordering dinner at a well-known restaurant. He lit a cigarette and let his eyes wander. There was no one he knew. Tourists on their way up the coast from San Diego; a few tired business men; a party from the Hollywood Studios exhibiting large eyes, red lips, and that particular type which constitutes the matinée idol; and in one corner of the room four young people, where mirth had become something more than audible. There was an excess of perfectly cooked food, and the restaurant cellar was famous, for these were pre-Prohibition days—and nights.

Shanklin ate slowly, preoccupied with many things. He glanced across the table and longed that the chair opposite were tenanted by the girl of his heart, no less of his heart now than formerly. He had lost any desire to forget, though it hurt abominably to remember. The worst time was when evening came, and visions flickered through his brain. Then the man in him revolted.

He was half-way through dinner when his attention was drawn again to the table at the corner, where were two girls and two men. One of the former had been drinking heavily; the other was pushing away a glass that one of the men held to her lips—a tall girl, fair, with blue eyes and masses of yellow hair. To Shanklin she looked frightened.

The other man joined his companion, and there followed a little struggle. Shanklin heard the girl's voice.

'Let me alone. I know when I've had enough—you don't.'

The two glanced at each other significantly. Shanklin leaned forward and listened.

'You haven't had nearly enough; we're only starting.'

Then the other woman laughed. 'Lap it up, you little fool. This is going to be the night of our lives.'

One of the men reached out, caught the girl on the soft of the arm above the elbow, and Shanklin saw his fingers sink into the tender flesh. He raised the glass again. 'Drink!'

For reply came a swift motion that pitched the wine into his face. The girl jumped up, her eyes full of terror, only to be pulled back into her seat. Then she broke away, one of the men shouting with laughter and dragging at her dress. For a fraction of a second her eyes met those of Shanklin, and he caught a swift petition for help.

It happened very quickly. He was in the mood for hitting some one, and he hit hard, with something of the driving force of Harrison's plunging-bit. The little knot of nervous waiters scattered like flies, and he found himself staring down at a man on the floor, while the girl clung to his left arm.

'Get me out—quickly,' she whispered.

There was silence in the room, then a burst of excited voices. The thing was over so rapidly that but few understood it. To all purposes it was a dramatic ending to a brawl.

Shanklin moved towards the revolving doors. Just before he reached them they turned, and Claudia entered, Sitwell close behind.

'Wait a minute,' said Shanklin to his trembling charge. 'It's all right—don't be frightened.' Then he glanced up and looked straight into Claudia's face.

III.

Shanklin never quite knew how he reached the street. Claudia stood, her eyes wide with astonishment that was mingled with a swift pain. The girl clung to his arm, timorous and dishevelled. From the floor a man lifted a bleeding face. To the casual observer there was only one explanation.

Sitwell stared, with a quick apprehension

that luck was definitely with him. He drew Claudia aside as though to protect her from things like this, and, darting one cynical glance at Shanklin, led her to a side-table. She sank into a chair with a feeling of hopelessness and disillusionment.

'It's a pity you married the wrong man,' said her husband, smiling—'but will you have thick soup or consommé?'

She got through the evening somehow. Sitwell made no further references, being actively engaged in thinking the matter out for himself. He argued contentedly that it should settle Claudia's wandering affection. He recalled the girl's looks, the flaxen hair, and the blue eyes, admitting that at least Shanklin had good taste, and played the rôle of righteous indignation to perfection. The pot was boiling now. He would let it simmer till morning. It was not till after breakfast he broached his proposal.

'Let's run out and see that property. I promised Martin I'd keep an eye on things.'

'But the car?' she hazarded.

'It's coming round now. I've bought it back. Our luck has turned.'

She looked at him almost happily. The car meant much to her, and she drove well.

'When you see this thing for yourself, you'll understand just how big it is.'

Claudia nodded. There was that in her mind she wanted to forget, if she could. The instinct of her love was smarting under a wound that ached, and ached. She welcomed anything that might divert her, that offered even the semblance of interest.

'We'll have lunch on the way out, and get there about two,' suggested her husband.

Threading State Street, she caught sight of Edith, and waved a hand. 'Bertie, there's Miss Winter. Wouldn't it be nice to take her out? It strikes me, somehow, as the right thing to do.'

He edged the car into the curb, mindful that this girl was Hunt's fiancée. 'If you like—yes—perhaps it would.'

Claudia signalled, and Edith came up.

'I was hoping that I'd see you to-day. Come and have lunch with me.'

'And I you. We're going into the country to see'—Claudia hesitated a moment—'to see some property, and want you to come.'

The gray eyes narrowed a little. Sitwell was leaning forward over the wheel. 'Do come,' he put in. 'Get you back here about four—only forty miles out. We'll have a bite on the way.' He spoke with a certain sincerity, suggesting that though the girl had kept her twenty thousand dollars, that was nothing between friends.

She experienced a throb of admiration for his nerve. 'Thank you—it sounds delightful.'

Claudia moved to the back-seat beside her. There was talk of Catalina; then Edith smiled into Claudia's eyes.

'That letter of yours—I never thanked you for it, but I acted on it.'

'I know you did, and I'm glad. Bertie doesn't—well—spend much time on the Enterprise now. He's got hold of something much better. We're going to see it to-day. I've never seen it.'

A faint colour climbed into Miss Winter's smooth cheeks. It was difficult to know just what to say, or whether to say nothing. She decided on the latter, with a feeling that shortly she would participate in something vivid enough for one day. Also, she was conscious of an accepted cheque for twenty thousand dollars, pinned inside the breast of her tan-coloured coat. It was strange that she should be aiding the fortunes of the man who, she was assured, was the real love of the girl beside her.

'I did so enjoy meeting Mr Hunt,' said Claudia. 'You must be very proud of him. We talked a lot on the way out. It was a sudden trip for him, and awfully hard on you, I'm afraid.'

'No, not exactly hard. I'm glad he came.'

'But you didn't see anything of him—only a few minutes.'

'It was a lot better than nothing,' murmured Edith reflectively. 'And he may be out again soon. He said that Mr Martin would probably come next time. Did he meet you?'

'Yes, at dinner.'

'Did you like him?'

'I only saw him once.'

'That means you don't. And I'm not surprised. Jim says he's a clever brute.'

'I know he's a brute,' said Claudia with a burst of candour. 'And I suppose he must be clever.'

Sitwell shifted his control and the car slackened pace. 'Talking about Spencer Martin?' he said over his shoulder. 'He's near the top in the oil business. I'm lucky to get him interested out here.' He glanced at Edith. 'I might be able to work you into something better than the Enterprise, Miss Winter.'

'Really. What is it?'

'What we're going to see to-day. Your fiancé inspected it. He knows.'

'He didn't say anything good or bad about it to me,' countered the girl truthfully.

Sitwell laughed. 'He's not working for you—yet. Here's where we have lunch.'

Edith looked up a little later. 'Anything new about the Enterprise?' She was feeling rather devilish.

'No,' he said calmly. 'Do you know what a fault is?'

'Whose fault?'

'No one's. It's a geological curiosity.' Sitwell cut a finger of bread, sliced a section out of the middle, and threw the section to one side. 'That illustrates it. We're going to see a

faulted part of the big anticline you visited some time ago.'

'Is that why it 's so good?' She became intensely interested.

'Yes; it carries all its original oil—unexhausted. The rest of the anticline has been flowing for years. It 's dropping off.'

'And if oil were struck on this property, what should it amount to?'

'One can't tell. It might run twenty thousand barrels.'

'In one day?' Her eyes were very bright.

'Naturally; worth about twenty-five thousand dollars.'

Claudia said nothing, and played with her fork. She saw that Sitwell's word of honour was in serious jeopardy; but the thought of partnership in anything like that filled her with new imaginings—even a fraction of it. And, curiously enough, this was also the thought that moved in Edith's brain.

(*Continued on page 261*).

CULLODEN IN A NEWER LIGHT.

WITHIN recent years fresh material bearing on the Battle of Culloden has been made available, mainly through the patient research of Dr W. B. Blaikie, who, in his *Origins of the Forty-Five*, has shed much new light upon several obscure points in the events of that fateful day. As one reads the concise *Account of the Battle*, by Andrew Lumisden, private secretary to the Prince, or the garrulous and less reliable *True Account of Mr John Daniel's Progress with Prince Charles*, it becomes increasingly clear that dissensions between Prince and peer, chieftain and clan, contributed more than Cumberland's artillery to the swift and utter rout of the clans on Drumossie Moor.

It had long been a source of controversy among Jacobites as to who was responsible for the selection of the moorland waste, five miles from Inverness, as the site where the last tragic act of the Stuart drama was enacted on the stage of history.

It is well known that, in the bitterness of his soul, the Prince afterwards accused Lord George Murray as being responsible for making a stand on the moor of Culloden, in opposition to the Prince's own desire to avoid combat there. The matter has now been placed beyond dispute by Dr Blaikie's publication for the first time of the official report of the Marquis d'Eguilles, the accredited envoy of Louis XV. of France to the migratory Court of Prince Charles Edward. Extracts from this remarkable document, the original of which is in the National Archives of France, make it clear beyond dispute that upon the Prince alone must rest the responsibility for the final decision to give battle on what is now known as the Moor of Culloden. The modern observer, standing on the battlefield, and lifting his eyes to the rising uplands of the barren Mackintosh country, protected by the natural barrier of the Water of Nairn, can see at a glance why the claims of this territory as a base for the operations of the Highland army were insistently urged by Lord George Murray, and supported by the chiefs of the clans, who were well aware of the strategic suitability of these hilly slopes for the mountain warfare in which their followers excelled.

The French annalist gives a vivid account of his own unsuccessful attempt to deflect the mind of the Prince to a saner policy. 'The Prince, who believed himself invincible because he had not yet been beaten, . . . could not bring himself to decline battle even for a single day. I requested a quarter of an hour's private audience. Then I threw myself in vain at his feet. In vain I represented to him that he was still without half his army, that the greater part of those who had returned had no longer targets, that they were all worn out with fatigue by a long march made on the previous night, that it was necessary to fall back to defend Inverness, that if the worst came to the worst we might betake ourselves to the neighbouring mountains—there it was he would be truly invincible, there we would remain masters of that part of the coast at which supplies of arms and money ought to be arriving, and as soon as these reached us, we should march toward England. In the end, finding him invincible in the resolve he had taken to fight at any cost, I made my desire yield to my duty. I left him for the first time. I retired to Inverness. . . . I saw before the end of the day the most striking spectacle of human weakness—the Prince was vanquished in an instant. Never was a defeat more complete than his.'

How can we reconcile these unprejudiced judgments with the violent accusations of the Prince, as narrated in the narrative of Neil Maceachain? Dr Blaikie's own verdict is, perhaps, too charitable. 'One can only surmise that, in his anger against Lord George Murray, the Prince's recollection of what had actually happened had become confused, and, surrounded by flatterers even in his flight, he had brought himself to lay the responsibility on his lieutenant-general.'

Further, it is now clear that on 15th April, the duke's birthday and the day before the battle, the Highland army was actually drawn up in fighting formation on Culloden Moor, in anticipation of an attack by the Royalist forces

as a likely incident in the programme of that festal day. As the day wore on and no enemy appeared, the idea of a surprise night-attack upon Cumberland's forces, lying near Nairn—a proposal, if not originated by Lord George Murray, at least cordially supported by him—was eagerly accepted by the Prince. The abandonment of this scheme, which a military critic describes as 'an attempt to march an army a distance of twelve miles in seven hours of darkness, and then form up for attack in two different directions,' led to fresh accusations by the Prince against Lord George Murray, whose steadfast loyalty to the Jacobite cause can alone explain his unchanging devotion to his royal master.

But if dissensions in the councils of war led to disastrous decisions of policy, jealousies for precedence among the chiefs and their followers corroded the efficiency of the fighting-line itself. The well-known ousting of the historic Macdonalds from their traditional pride of place, in order to make way for the Atholl Highlanders, was a tactical blunder on the part of Lord George Murray, which even the persuasive charms of the Prince himself failed to compose. It will be remembered how the Duke of Perth tried to soothe the ruffled feelings of the clansmen by exclaiming, 'If the Macdonalds behaved with their usual valour, they would make a right of the left, and he would henceforth call himself a Macdonald.' But even this moving appeal to clanship failed, and, with true Highland stoicism, they quailed not before the murderous fire of the English regiments, and their simmering passion found its only outlet in a desperate beating of the heath with their broadswords.

Of all the clans which fought at Culloden, the most numerous and powerful was the confederacy of the Clan Chattan, whose natural leader was The Mackintosh of that ilk. The chief had embraced the Hanoverian cause, while his gallant lady, the famous 'Lady Anne' of Highland romance, strove to make up for this family delinquency by a passionate attachment to the Prince. In the absence of her lord, she called out the clan and nominated Mackintosh of Castle Leathers to lead the Clan Chattan to battle. The night before the battle, however, young MacGillivray of Dunmaglass went to Moy Hall and informed her ladyship that the MacGillivrays would not fight next day unless he were placed in command of the Clan Chattan. Dunmaglass, in turn, had been driven to this bold step by the urgent persuasion of his lover, Elizabeth Campbell of Clunas, in Nairnshire, an adventurous Jacobite, who told him that unless he led the Mackintosh clan for the Prince he need come to see her no more. The distracted Lady Anne sent for her kinsman of Castle Leathers, and begged him, by all the ties of affection and clan kinship, to renounce his claim in favour of Dunmaglass. His reply is historic in northern tradition: 'My lady, I resign my command at your request, but a Mackintosh chief can never serve under a MacGillivray.' He returned to his home, and took no further part in the campaign. It is now known that Mackintosh acted as he did rather than disgrace himself in the eyes of another Jacobite lady of the north—Miss Anne Dallas of Cantray—who would not brook to see her lover serve other than leader of his clan. A gentle Highland lady, descended from Anne Dallas, who died within living memory, used to declare with profound conviction that the Battle of Culloden was lost mainly through the jealousy of these two young ladies, which placed the leadership of the great Clan Chattan in the hands of the gallant, yet inexperienced, MacGillivray of Dunmaglass. From these and similar fireside jealousies, so characteristic of the Celtic temperament, sprang bitter rivalries which cost the Prince's army dear in its day of trial.

When sunset fell on the stricken field, the Prince was already a fugitive in the wilds of the Mackintosh territory, possessed with the one burning desire of escaping to France. A considerable remnant of his stricken forces, among whom were Lord George Murray and the Duke of Perth, assembled at Ruthven, in Badenoch, and, nothing daunted, were eager to continue the struggle, in the hope of securing more advantageous terms from their conquerors, while, there still remained a faint hope of further aid from France. But the Prince was obdurate. He deliberately chose for himself the prospect of a hunted outlaw, desperate for his own safety, and regardless of the many gallant men of noble blood who had forfeited everything but honour for his cause, and into whose soul was to enter the iron of the oppressor, leaving a legacy of blood and tears which only the healing hand of Time has effaced.

SWEET SPRING-TIME.

THERE is a mist of bluebells in the woods,
Where gentle cushats pipe the livelong day;
In daisy-spangled meadows, lush and green,
The snowy lambkins play.

In mossy dell sweet violets shyly hide,
Wafting their fragrance on the balmy air;
In sheltered coombs the yellow primrose spreads
A carpet bright and fair.

O'er breezy downs the radiant gorse has flung
A mantle rich of gorgeous cloth of gold;
Whilst, far below, a sapphire ocean tells
Its tale so often told.

O, beauteous spring, clothed in the royal robes,
Sent from above to cheer the hearts of men,
We bid thee joyous welcome, lovely queen—
Old earth is born again.

B. DUNBAR DEY.

APPLIED PSYCHOLOGY.

By JOHN S. MARGERISON,
Author of *Action! The Hungry Hundred, Petrol Patrols, &c.*

PART I.

I.

IF Wiggie Bennett, able seaman of H.M.S. *Blusterer*, hadn't been in that state of chronic impecuniosity known as 'broke,' he would never have taken any stock in psychics or the occult, and he would most certainly never have received promotion and honour so quickly as he eventually did.

As a rule, he shunned the shore when his pockets were empty. Indeed, it was only a prolonged dose of 'sea-time' and the hope of meeting an 'old ship,' who might be relied upon for a treat, that had brought him ashore this evening. But though he had tentatively looked in at the doors of several sailor-haunted bars, he had found no friendly philanthropist that he knew. Therefore, merely to pass the time, he found himself sauntering past music-halls and cinema-theatres, scanning the lurid posters with some indirect appreciation of their thrill. He exchanged badinage with several members of the opposite sex; but these, on discovering the seaman's bankrupt state, merely flung insults at him, and went to prowl elsewhere.

Wiggie looked after them dubiously. 'Pals, eh?' he asked himself. 'If I had money they 'd be pals all right. But not to-night, thank you! Alone in a great city,' he added; then he chuckled. 'If I was one of them lucky chaps what owns a watch I'd have a loan right away. Not half I wouldn't. Hello! what 's this? Looks like somethin' for nothin' at last.'

His surmise was apparently right, since it was the legend 'Admission Free,' in three-inch block letters, that had caught his eye. This somewhat surprising notice headed a placarded announcement to the effect that 'The Cliché of Occult Clutchers' were, that same evening, to be addressed by a most learned professor—at least, he must have been learned if the alphabetical distinctions displayed astern of his name were any criterion — on 'Psychology and its Application to Everyday Life.' The venue, added the poster, was the hall whereupon it was displayed; the hour, according to the clock over the door, was right on hand; and the non-occult public were cordially invited to attend the séance, or meeting.

'I dunno much about psychology,' muttered Wiggie to himself, as he reached the foot of the placard, ''ceptin' that I was in the old *Psyche* in the Home Fleet once. But I ain't got nowhere else to go, and p'r'aps they 'll hand round coffee and buns. Here goes, Wiggie Bennett, for a night with the perfesser.'

The Occult Clutchers didn't hand round coffee and buns, but, to balance matters, they didn't take up a collection either. Not that the professor's lecture on applied psychology wasn't worth much—as a matter of fact, he afterwards wrote it, and a most important publication gave him good guineas and half a leading article for it.

The Clutchers enjoyed it; so did Wiggie, in spite of its strangeness. The professor was certainly a spell-binder, and his novel doctrines held the sailorman by their weirdness. According to the professor, a man might learn much about the character, the intentions, and the attributes of another person by the way he scratched his ear, or blew his nose, or even lit his cigarette. Dreams were not merely the idle vapourings of an unfettered brain, but messages from another world, which, with the help of applied psychology and a 'guide'—a kind of spirit specially detailed to take charge of one's person throughout life, yet who only started duties after the 'guidee' had made himself acquainted with his guider—might be properly and profitably interpreted.

Applied psychology, Wiggie learned, would lay bare to its applier the innermost soul, the thoughts, the motives of any one and every one with whom he came into contact; one could, with it, detect not only crime, but the desire to commit crime. By its aid one could avoid unpleasantness and punishment, because it would show you the line of action which would mollify your *vis-à-vis*, and, by pursuing this line, you could gain your own object without letting your opponent know you had done so.

All this, and a great deal more about 'occult guides,' Wiggie drank in eagerly. It struck him with great force that applied psychology would be exceedingly useful in his own life aboard H.M.S. *Blusterer*, that the application of its simple rules would give him an advantage over his fellows that wasn't to be despised. He must learn more about this wonderful stuff; surely there were those who would be willing to impart to him the rudiments of the science, and the method of becoming acquainted with one's occult guide, perhaps (this with a rueful grimace) without any charge for the teaching.

Accordingly, when the meeting was over Wiggie hung around, and eventually wangled himself into a conversation with two of the Occult Clutchers, who detailed with enthusiasm to the earnest inquirer all that they knew—and much more that they merely surmised—regarding the occult and the psychic. He promised to attend a further meeting the next Sunday,

and then departed alone for the dockyard to go aboard *Blusterer*. And it never struck him that, if all the professor had said was true, the Clutchers should quite easily have been able to psychologically diagnose his penurious state and relieve him therefrom. They hadn't even offered to buy him a drink!

II.

Wiggie was full of the subject—indeed, he was mentally groping round to get *en rapport* with his 'guide'—when he entered the dockyard gate. A most material marine, who believed only in spirits that are surrounded by bottles, overhauled him, and spoke. "'Lo, Wiggie!' he said; 'going off early to-night, ain't you?'

'I am,' said Wiggie; 'I'm broke. So are you, I expect, else you'd not be roamin' aboard so early as this.'

The marine gestured loftily. 'Not exactly broke,' he said, with a grin. 'A bit bent, of course, seein' what end of the month it is, but still lively, y'know. Fact is, I've promised the girl I'd come straight aboard; she doesn't like me stoppin' ashore all night—'fraid I'll sleep too long in the mornin', I s'pose, and break me leaf.'

'Didn't know you was doughy on any long-haired chum,' remarked Wiggie, his subconscious mind still groping for contact with that elusive 'guide,' and his eyes watching the marine's face in the intermittent glare of the dockyard arc-lamps. 'Who is she? Do I know her?'

'Don't think so,' was the answer. 'Let's see—her name's—er—Maggie—Maggie Elliott; lady's-maid in Southsea. Reg'lar high-stepper, I can tell you; good-lookin', red-headed, and doesn't want a chap to be always weighin' out money for 'er. In fact, whenever we goes to the pickshers she always pays for herself, and sometimes for me too.'

Wiggie grinned; it seemed that something outside of himself was whispering in his ear, that the 'guide' had at last acknowledged the acquaintanceship, and had got to work without delay. Also, Wiggie was applying his new-found psychology to this heaven-sent subject—and, most wonderful of all, it was working. He stopped dead underneath a glaring arc-lamp and faced the marine.

'Jumper Collins,' he said curtly, 'you're a liar, and a rotten liar, too. You ain't got no girl called Maggie Elliott; you made up the name and the wench when I asked you. I could hear your mind workin' at the time. You ain't goin' aboard to-night 'cause you've been sent, but 'cause you're as busted as I am, and can't fish out the necessary tanner for a bed. And if you ain't a liar, then you're just about the meanest skunk afloat to let a hard-workin' girl pay for you to stretch your great, fat, lazy, ugly carcass in a picture-palace!'

'Here, what the blazes you gettin' at?' demanded the marine hotly. 'You've been spyin' on me, or else readin' me letters. How do you know I ain't got no girl, and no money to stop ashore with, eh? Whose private business have you been pokin' your long nose into, eh?'

'Yours, of course,' retorted Wiggie, still acting under what he considered the promptings of his guide. 'But as for spyin' on you, and readin' your correspondence—well, there ain't no need for me to do either so long as you carries "liar" and "mean hound" written on your face for them as has opened eyes to read. Ain't you never heard of applied psychology?'

'I ain't,' snapped back the marine, purple with rage, and shaking his fist in Wiggie's face as he danced round the seaman. 'But I have heard about blighters like you gettin' their heads punched, and things like black eyes and broken noses written on their faces for blind folks to look at. That's just what's goin' to happen to you this minute if you don't apologise.'

Now, this is where Wiggie should have applied the old professor's dicta regarding the avoidance of unpleasantness; should have psychologised the correct answer and turned away the marine's wrath. But the fist shaken so close to his face effectually drove psychics and occultism out of his mind, and the red blood of a fighting Englishman swept exotic notions aside. A marine—and a *red* marine at that—had threatened to hammer him. His psychics might be doubtful, and need an occult guide for their proper application; his physique was a certainty, and he knew how to direct that himself. Therefore, with a snarled word of profanity, he led direct at the marine's out-thrust jaw—and it was quite a pity that a prowling dockyard policeman happened that way ten minutes afterwards, and prevented the battle from becoming really decisive.

III.

The pair walked the remainder of the way to the ship in brooding silence, while the unpsychic exponent of a most physical law shepherded them till they crossed the gangway. And it was the merest stroke of ill-fortune which brought the lieutenant of the watch on to the quarter-deck at the precise minute that the late combatants turned to leave it. The trio came face to face—the marine nearest the officer—and all halted.

'What's the matter with you men?' demanded the officer. 'A pretty fine state to return from leave in, I must say. What have you been doing?'

The marine cleared his throat. 'It's all the fault of them dark places in the dockyard, sir,' he lied fluently. 'We was crossin' one of 'em, and we tripped over some wires and barged clean into a stack of timber, me down first, and

Wiggie here—Able Seaman Bennett, I mean, sir—on top o' me. We rolled over each other, and got knocked about a bit, sir, and that's all.'

Now, at any previous time Wiggie would stoutly have supported this farrago of falsehood, in which case the lieutenant, having no option but to take their word for it, would have been compelled to let them go without punishment, which a confession of fighting might very well have earned for them. But Wiggie's newly awakened 'guide' was hard at work, calling the seaman's attention to the impatience in the officer's eyes, the stern set of his jaw, the clenching of his hand in self-control till the knuckles showed a little white, and the slight sneer on his face at the marine's lame tale. The 'guide' bade Wiggie use his psychological reason, and act accordingly.

'Now I'll have your version, Bennett.' The officer's voice cut in on the guide's promptings. 'I suppose a baulk of timber got up and bit you, or something of the kind, eh? What was it gave you that wonderfully swollen optic, and that cut lip, to say nothing of the bruises not yet visible to the naked eye?'

'I got 'em in a scrap with a fellow who said he'd punch me head, sir,' he replied suddenly, and the marine gasped in astonished horror. 'He did punch it, too, but he got his own punched as well.'

He looked the lieutenant clean in the eyes, and not in the boots, as Collins had done. His own eyes were quite steady, and he could almost feel his 'guide' patting him on the back.

The lieutenant started, then grinned. 'That's frank enough, anyhow,' he said; and Wiggie thrilled to the note of surprised approval in his voice. 'I suppose you'd refuse to tell me the other fellow's name if I asked, so I'll not ask. But I'll tell you this—if you'd backed Collins's tale, I'd have sent you both to spin the same yarn to the commander in the morning, and you'd have got punished. As it is, I'll let the pair of you off with a caution. Off you go and turn in, and don't finish the scrap to-night, lest you disturb all hands. And, Collins, if I were you I'd take a few lessons in the art of lying convincingly, or else get Bennett here to teach you to tell the truth. You lie so damned badly, you know! Carry on!'

They carried on, and strode forward along the deck.

'Strewth!' ejaculated the marine; 'but ain't you a pie-can, tellin' an officer the truth and lettin' me down! I've a good mind to bash you for it.'

'You can, to-morrow night,' returned Wiggie placidly; 'I'll be on the forecastle with the gloves any time after five o'clock if you're strollin' that way. And look here, Mr Bloomin' Leatherneck, keep your fancy names to yourself. If you were to study applied psychology a bit, and get *en rapport* with your occult guide, you'd know when it was policy to tell the truth and when to lie, like I do. It's proof to me that my guide's workin' and my psychic theory's practical—didn't the officer of the watch tell you the same as I did, that you're a liar, and a darned rotten liar to boot?'

IV.

By dint of careful nursing and the application of raw beef and some wonderful unguents Wiggie's countenance had so far recovered by the following Sunday as to allow him to be presentable enough to attend the psychic service of the Cliché of Occult Clutchers, as per previous promise. He was glad he went, because they told him the name and the shape of his guide, the colour of his personal aura, and lots of other things that you and I might think savoured of charlatanry. They lent him books and tracts, and turned him into a most ardently psychic spiritualist, and sent him aboard even more elated than before.

And he repeated the dose whenever he could, so that when *Blusterer* at last crawled to sea on one of her periodical voyages down the Portuguese coast to Gibraltar he was not only an ardent votary, but also the leader of a private Cliché of Occult Clutchers he had formed aboard. His messmates grew to hate him, and almost to fear him. He had an uncanny knack of trying his psychological theories upon them—in plain English, he poked his nose into their business most unmercifully. His guide worked overtime, too. Marah was the name by which Wiggie knew him, and apparently he was an Egyptian priest of the time of the Pyramid building.

Did a messmate write a letter, Wiggie watched his face and eyes, and guessed pretty correctly—aloud—the relation of the writer to the addressee, and also whether the former was writing lies, or sweet nothings that meant what they were worth. The bosun's mates loathed him, for he uncannily and psychically diagnosed—again aloud—their attacks and defence in the nightly games of chess on the upper deck; he applied the new science so successfully to card-games that his comrades accused him point-blank of cheating. He psychologised work of unusual dirtiness or arduousness well in advance, and managed to evade its performance; his guide prompted him to try a psychic excuse upon the commander when called upon to explain why he had allowed himself to be discovered in the act of psychologising a surreptitious sleep during working-hours, and he wasn't a bit surprised when the commander responded satisfactorily to the psychological test. It was all so wonderful—so thoroughly gratifying. With this new science at his finger-ends he was above his fellows—a super-bluejacket.

Now it so happened that a youth named Cocker, one of the most impressionable of *Blusterer's* company, and a shining light in the séances of the ship's Cliché of Occult Clutchers, fell ill of a brain fever; nor was his recovery helped at all by the fact that he had been severely shell-shocked during one of the minor naval actions of the Great War. It became imperative that if the lad's life and reason were to be saved he should be kept in absolute peace and quietness, and that he be transported to a home hospital without delay. *Blusterer* was detached from her sisters of the Atlantic Fleet and ordered home to England.

The infamous Bay of Biscay was waiting for her; indeed, it gave her a more than boisterous welcome. Tumultuous waters leapt to greet her; a rip-roaring gale swathed her in a mantle of rushing wind; and between them the elements buffeted her till she rolled and pitched and corkscrewed as only a top-heavy warship can, and threatened every minute to tumble over herself and founder. Curses loud and deep and vibrant, against the ship and the weather and the impulse that led them to choose a sea career, rolled from the lips of those whose duties led them on deck, the while they clung with both hands for safety. All men knew that there was more than a little danger of being swept overside; knew also that there would be absolutely no hope of their being saved in that case, for no boat ever built could remain afloat in such a storm.

When *Blusterer* left harbour she had been thoroughly snugged down against heavy weather; but, just because folks hadn't enough trouble to handle already, the port lower boom—a circular piece of steel some fifty feet long and a foot thick, to which were tied *Blusterer's* boats when the battleship was in harbour—took it into its inanimate and malignant head to chafe through its lashings and noisily break loose. It was night when this happened, or, rather, early morning, since midnight was twenty-seven minutes gone, and the first thunderous crash of the three-ton boom against the ship's side not only woke up every soul in the ship, but told them that further repose was absolutely out of the question till it had again been secured.

And down in the sick-bay a white-faced boy suddenly ceased wrestling with the sick-berth steward and delirium, listened a moment, and then buried his face in the steward's coat. 'The guns!' he screamed; 'they're shelling me. For God's sake, tell 'em to cease firing!'

And at every repeated crash of the boom against the ship's side he screamed again, for in a confined space the noise was exactly like that of a huge shell bursting, as the steel plating of the ship echoed like a drum to the thrashing of the hollow steel drumstick of a boom.

Picture it for yourself: the great ship reeling through the dark, head to wind, with the raging sea abeam—had they altered her course she would have rolled and pitched just the same; from her side, between the break of the shelter-deck and the end of the boat-deck, the great boom, held only by the wire-rope that kept it horizontal, thrashing, when the ship rolled to port, deep into the sea, burying one-third of its length in the water—when the ship rolled to starboard, lifting clear, and rushing back like a flail to drive against the steel ship's side; and every second the seas crashing aboard and beating back those who would have tried to secure it.

CHANGES IN BIRD-LIFE IN NEW ZEALAND.

By R. S. Sutherland, R.A.O.U.

THE birds which inhabit islands are especially subject to the fate of extermination. On an island, no matter how small, each variety has long been brought into harmony with its circumstances, and relations with its fellow-creatures have become so far mutually adjusted that in the long-run the balance between them is preserved, and the stock of each species of bird remains the same year after year. Certainly was this the case with New Zealand, a country so long isolated that the major portion of the larger birds had become flightless, or had lost to a greater or lesser extent the power of flight. But the arrival of man upon the scene immediately upsets the balance of nature. Civilised man, more so than the uncivilised, coming as he does with the intention of remaining, even if he does not straightway cut and burn the forest and undergrowth, always introduces, accidentally or otherwise, various animals which prey easily on the native fauna. Some animals, such as cats and rats, prey directly on the birds by killing the parents and eating the eggs; but others, such as pigs, goats, and rabbits, are harmful in the fact that they eat the food, and so starve out the endemic species.

Some fifty or sixty years ago, an evil influence, passing under the name of acclimatisation, was instrumental in introducing into New Zealand all sorts of birds, which, being of strong species, speedily established themselves, with disastrous effects on the aboriginal birds, and in a very evil day rabbits were imported for sporting purposes. Many zoologists and naturalists, notably amongst whom was Buckland, realised to a small extent the harm that was to come of this step. Every one

knows that the rabbit plague has inflicted considerable loss upon this country, but the remedy applied to reduce the plague was in this case far worse than the disease. Stoats, weasels, and ferrets were imported from England and elsewhere, and it was proved true, as Professor Newton stated some time after, that 'two wrongs do not make a right, even at the Antipodes.' For the weasels, while they prey easily on the native birds, make no impression whatever on the numbers of the rabbits.

The evil results of a short-sighted, unconsidered system of wholesale acclimatisation are far-reaching; but before continuing an account of recent extermination, I must go back to the time when the Maoris first arrived in New Zealand, and the mighty moa and its smaller relatives roamed in large numbers over the country. There can be little doubt that the Maoris finally exterminated the moa in about three hundred years, and that a similar length of time after its rooting out saw the arrival of the first Europeans. A large amount of traditional lore regarding the moas has been told to the numerous inquirers, but some of it was not improbably supplied to meet the demand for such stories. The superstitious and flesh-loving Maori, confronted on his arrival by a gigantic bird twelve feet in height, would require no further inducement to kill. Hunger and superstition both played their part, and the moa and its relatives, numbering about twenty varieties in all, had to go.

When the colony was first explored by white men, moa-bones were found lying on the surface of the ground in many districts in great profusion, being specially abundant near the old cooking-places of the natives. They occur, too, in the most superficial and recent deposits, such as blown sands, as well as in caves and swamps. Skeletons were also found in the South Island, where the climatic conditions were favourable, with the bones still connected by dried muscles and ligaments and covered with skin and feathers, and were, in fact, natural mummies. Portions of egg-shells, and later whole eggs, as well as pebbles swallowed by the birds, and contained in their stomachs at their death, were likewise discovered. Geological evidence seems to carry back the moas to a very remote epoch, and it is highly probable that they were on the down-grade previous to the arrival of the Maoris.

Still more remarkable is a giant penguin, the bones of which have been found in the Oamaru freestone, and have been completely described by Professor Huxley. Although not the largest of fossil penguins, this one stood upwards of five feet in height, with a wing measurement of approximately twenty-six inches. Larger still is the Seymour Island (South Shetlands) penguin, which was unearthed at that island in 1900. This bird stood in life over six feet in height. Imagine a penguin as tall as a large man, and weighing probably somewhere about two hundred pounds.

To come back to more recent times, mention may be made of the takahe (*Notornis mantelli*), an exaggerated form of moor-hen or coot, which has an interesting and perhaps unique history. An imperfect fossil skull was first discovered amongst a quantity of moa-bones from the North Island, and, small though this evidence was, Professor Owen was able, by numerous careful comparisons, to state accurately its relations and affinities, and to form for it a new genus under the name of notornis. Two years after, a live specimen was captured on Resolution Island, west coast of the South Island, strangely enough by the discoverer of the fossil skull, and the bird was named after him. Only four museum specimens of this remarkable bird now remain, and it is probable that it owes its apparent extinction to the Maoris, who have a tradition that the takahe was contemporary with the moas, and was formerly used as food.

In speaking of the west coast Sounds, mention must be made of the kakapo, the kaka, and the kea, three parrots, all of which are found only in New Zealand. The first-named bird was first made known by Dieffenbach, who in 1843 secured some tail-feathers, which, he considered, from the description he obtained, belonged to a form of cuckoo. Some time after a skin was forwarded to the British Museum, and it was then rightly classed among the parrots, and is now usually called the ground or owl parrot, the latter from its facial resemblance to the owl. The bird is partly nocturnal in habit, and the Maori name, kakapo, meaning night-parrot, is very suitable.

The kaka, or brown parrot, is still to be seen in some remote parts, but not a single specimen has been observed at Puysegur for upwards of twelve months, although formerly they were very abundant here, the miners some few years ago shooting as many as fifty in a day for 'sport.'

The kea, or mountain parrot, is common—too much so for sheep-owners in the outlying districts of Canterbury and Otago, where a price has been set upon its head, and large numbers are annually destroyed. The bird was formerly a vegetable feeder, but has recently adopted the habit of attacking living sheep for the purpose of eating the flesh, their favourite portion being the kidney fat. As in the case of all birds which are persecuted, unless the persecution is extended over a long period, and is persistently carried on, it thrives, but in this case its survival is no doubt due to the inaccessible places which it haunts and on which it nests.

Formerly very numerous, but now rarely seen, were the parrakeets, large flocks of which plagued the Mackenzie country, invaded the west coast towns and villages, and spread over the settled districts of Canterbury, playing great havoc with fruit and grain crops. Thousands were

killed during the years 1885 to 1888; now only a few pairs are to be seen.

A species which was confined to a very small area of the North Island was the huia, a remarkable bird, the male and female sexes of which Gould was led to describe as two distinct species. The most striking difference is in the bills, that of the female being long and much curved, and that of the male short and straight. The tail-feathers, which were greenish-black, with a broad band of white at the tip, were much sought after by the Maoris as head ornaments for the chiefs. The birds were, it appears, never very plentiful, and the practice of killing them to secure the tail-feathers was probably the cause of their extinction. The party of Maoris, under the leadership of Taiaroa, who visited Queen Victoria offered, amongst other presents, some huia tail-feathers, which they were compelled to purchase at a pound each. The skin from which these feathers were taken is still existent.

The kiwi, although not extinct, is nearly so, and no doubt would be were it not for the sanctuaries set apart for it by the Government. The kiwi is the queerest and most unbirdlike of all New Zealand's peculiar birds, and appears to be made up of the odd parts of several other species of birds. As Sir R. Owen says, 'it seems to have borrowed its head from the long-billed waders, its legs from the domestic fowls, and its wings from the ostrich or emu.' Being a bush-loving, semi-nocturnal bird, the kiwi was spared somewhat the depredations of the Maoris, who avoided as much as possible the gloomy depths of the dense forest. Although it was very plentiful when the Europeans first arrived, its days are now apparently numbered.

Another doomed bird of great service to the agriculturist, in that it destroys the grubs of odontria (an insect which plays havoc with imported grasses), is the woodhen, or weka. Stoat and weasel, dog and gun and fire, have all been contributing causes of the weka's extirpation, and very few are now to be seen, even in the remote unsettled parts of the country. At Puysegur, probably at present the most sparsely populated part of the South Island, only one or two are occasionally heard calling, and this is a place where they were once more numerous than fowls are at present in Christchurch.

To take Puysegur and Preservation as an example of the changes in bird-life, formerly kiwis, wekas, kakapos, and kakas abounded, but now only an odd weka is heard. Their places have not been filled. Parson-birds (tuis), bell-birds, and fantails were very numerous, but are now few and far between, and sparrows and starlings predominate. The goldfinch, although a very welcome addition to the New Zealand countryside, has supplanted the native tomtit and the robin; and the introduced skylark vies in number with the endemic ground-lark. A thrush or two, a flock of harsh squawking starlings, sparrows and larks, some goldfinches, bullfinches, and greenfinches, and a solitary imported sparrow-hawk, which preys principally on the native larks, form the major portion of the bird-life. Where the wattled crows, mentioned by Captain Cook as flocking in hundreds, and where the morepork-owl and the laughing-owl hawked by night for the native rat, the ubiquitous sparrow now twitters, and the domestic cock crows discordantly. The wood-pigeons are still to be seen, though in very reduced numbers; but since the gold-claims have given out, and the miners have departed, there is hope that they will now multiply.

What other part of New Zealand but has had its changes, the imported bird in every instance taking the place of some peculiar native species?

A book on the commoner birds of Britain applies almost equally to New Zealand, and this in a country that, less than eighty years ago, contained the strangest and most remarkable birds in the world.

CLUES TO OCCUPATION.

By JOHN C. GOODWIN.

'I KNEW he was a sailor, for he wore a sailor's hat.' So runs the old song, but the wits of the modern detective must needs be sharper than that to gauge a suspect's calling from his outward appearance.

A crime has been committed. Circumstances point to the culprit being, say, a cabinetmaker. The detectives have now to find not merely 'cabinetmakers,' but one particular cabinetmaker, whose identity may be quite unknown to them.

Little subtle indications, which would pass unnoticed by the man in the street, are recognised and noted by the trained eyes of detectives, though these, being only human after all, do not always display the genius and acumen of the average 'magazine detective.'

It goes without saying that one's vocation must needs leave some trace upon one's appearance. We speak of a policeman's walk, a soldier's bearing, a sailor's roll, an artist's hands, and the face of a dreamer, while were an ostler and a curate to exchange clothes neither could conceal his real vocation for long.

When the American Professor Webster murdered his victim at Boston, it was the very skill with which the corpse had been dismembered and destroyed that pointed to the

fact that some one with an intimate knowledge of anatomy had done the deed, and, that fact having been established, the net was not long in closing round Webster.

The Sherlock Holmes narratives teem with skilfully conceived sketches of the art of deducing vocations from appearances.

Engineers frequently show a callosity at the junction of the thumb and the forefinger of the left hand, due to the friction of the chisel, while oil collects in the crevices of the skin and harbours iron-filings and similar impurities, and in course of time a hard, discoloured patch makes its appearance.

Stone-masons also develop a peculiar condition of the skin, but in their case the skin feels hard and dry, almost brittle. Riveters are similarly afflicted, and their hands generally bear the marks of scorchings in addition. Most manual workers whose occupation entails the chafing of their hands with the instruments of their toil show a thickening and hardening of the skin at the parts which come into contact with their tools, and among them may be grouped hand-loom weavers, coachmen—in whose case the constant friction of the reins is responsible—gardeners, and joiners. In the case of the last-mentioned an incident is related by Dr Gross, the eminent criminologist. A crime had been committed, and the culprit had left his coat behind on the scene. This garment was accordingly sealed up in a strong bag and beaten with heavy sticks. The bag was then opened, and the dust which had been beaten out of the coat was examined through a microscope. This scrutiny disclosed some very fine sawdust, this fact serving to indicate that the wearer of the coat was either a joiner, or a carpenter, or was employed in a sawmill. There were, however, also found minute particles of gelatine and glue. Carpenters and sawmill employees do not use glue, and the opinion was accordingly formed that the criminal was a joiner, which view was subsequently confirmed at the resulting trial. It is of interest to note that the right shoulder of a joiner is somewhat higher than the left, owing to his constant work with saw and plane. The use of these tools is also responsible for the right hand being larger than the left.

The hands of chemists and photographers are frequently found to be stained with chemicals; while the skin of miners is often pitted with blue specks, through particles of coal-dust being shot into it during blasting processes.

The skin of hatters' hands is generally highly polished and devoid of hair. This is due to the chemicals used in the felting process; while confectioners and pastry-cooks not infrequently lose their finger-nails, owing to the cumulative effect of years of handling the juices of the preserved fruits used in making fancy pastries. Their teeth, too, are poor, due to the action on the gums of particles of flour inhaled during breathing.

The tips of the fingers of a violinist's left hand become hardened and thickened in course of time, in consequence of the perpetual pressure upon the strings of the violin; and the same peculiarity, induced by the nature of their work, is often discernible in the case of typists, who are also liable to contract a form of writer's cramp.

We can all recognise a boxer as such should he boast the traditional 'cauliflower ear'; and in Newcastle, St Helens, and Widnes, the chief centres of the glass industry, old-time glass-blowers may be 'spotted' at a glance by their enormously distended and pouching cheeks, though, since the introduction of compressed-air machinery in that trade, this occupational clue is becoming scarcer.

When a known jewel-thief is suspected of being implicated in a robbery he is closely shadowed, with a view to discovering whether he is being visited by any one employed in the jewellery trade. Diamond-cutters, especially those working in Amsterdam, whither most of the jewels stolen in this country ultimately find their way, hold the jewel upon which they are engaged by embedding it in an alloy of 60 per cent. lead and 40 per cent. tin. In time, the polishing-brush passing rapidly over both the alloy and the fingers of the worker, the latter become discoloured with the lead, while lead poisoning may even ensue, betraying its presence by the usual thin blue line on the gums.

A tailor may generally be recognised by the series of tiny punctures on his left forefinger, caused by his needle slipping as he plies his trade. An interesting case, related by Monsieur Mace, formerly Chief of the Paris Detective Bureau, hinged upon the peculiar type of stitching employed by French tailors. The leg of an adult male was one day discovered in a well in a back-garden on the outskirts of Paris. A single letter was found to have been woven in the sock. The leg was stitched up in sacking, but the stitching struck M. Mace, who had charge of the case, as being that commonly employed by tailors, one of which fraternity he ultimately discovered to be the 'wanted' man.

The habits, or even the gait, of a man will sometimes afford a clue to his occupation. The writer was for a time during the Great War in command of a unit quartered on the west coast. He began to notice that one of his orderlies was in the habit of ascending the stairs of the house in which the orderly-room was installed in a very cautious, almost stealthy, manner, on tiptoe, and always keeping to the wall, as if to minimise the leverage on the stairs which tends to cause creaking and to disturb people. On the man being asked whether he was a night-watchman in civilian life, he replied, 'Yes, sir, in the T—— Maternity Home.'

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

SHORTLY before he left this country for his home in America—even then he was ill, and he died soon afterwards—I sat at a private dinner-table near to Mr Walter H. Page, Ambassador of the United States to the Court of St James's throughout the war period, who might have been described as the most important ambassador in the world at that time. A peculiar tranquillity seemed wrapped about him, a sense of all being past and done with. Those next to him listened to some of his calm reminiscences of the terrific period of August 1914, and other times, delivered slowly in a soft, pleasant tone, which was characteristic of the man, one of the most reasoned and yet passionate friends that ever Britain had. It seemed to indicate a man of intense sensibility and philosophic care of judgment. Mr Page being neutral and yet friendly to us, being one of the best, humanly and intellectually, of that brilliant line of ambassadors that Washington has given to St James's, and being an acute observer and careful deducer, there will surely never be anything sounder or more illuminating than his notes and reflections upon the grand and confusing circumstances of the period of the outbreak. This appears to be the most accurately adjusted and dependable historical perspective yet presented of that epoch. It nearly seems that 1914 is already in a far-back age, and that we ourselves, needing to be reminded of many things that happened then, might almost consider it as dispassionately as we might reflect upon the landing of Julius Cæsar on the coast of Kent. We have all been born and educated and brought up again since then; we have difficulty in imagining the happy, careless—and yet thoughtful and respectable—people that we were in those smooth days, making mountain-ranges, in the way of political affairs, from a pinch of sand, and being so enthusiastic in the discussion of problems in an academic way, because the best of problems often lacked, as it now appears, either reality or vital urgency. There was a sufficiency to eat, the cost was small, there was pleasure for many; and if the poor, the unemployed, and the Socialists demanded attention, there was a half-impression at the time—not a safe idea, perhaps—that there was eternity in which to attend to everything. Meantime men and women lived in tranquillity, and died in peace and honour, to the regret of their friends; successions worked smoothly; pockets contained golden sovereigns, three or four per cent. was fair enough, and Consols up towards their par were as firm in the capital sense as the Nelson Monument in Trafalgar Square. When tired of London, one might travel by the train to Brighton and back for half-a-crown, which seems impossible—but it was true; and London was always such a pleasant place that it was delightful to return. All this was; we lived in another world. The heightened difficulty we have in visualising it now, in attempting to reconstruct our past pre-war selves, is indicative of the mental remoteness of all that history and the merit of historical perspective that may be applied to it.

* * *

Nothing has suggested this fancy to us so forcibly as the notes and correspondence contained in *The Life and Letters of Walter H. Page*—reproduced in advance in *The World's Work*—which constitute some of the soundest and most vivid history of what Mr Page himself called 'the grand smash' that the world is ever likely to obtain. They are fascinating for their dramatic quality, their revelation, and the assistance they afford to us in the reconstruction of our forgotten selves of halcyon days long gone. On the 2nd August 1914 the American military attaché went to lunch with Mr Page, and what they most and inevitably discussed upon that occasion was whether Britain would enter or refrain. The attaché saw no way for Britain to abstain. 'If she keeps out,' Mr Page reported on the conversation, 'Germany will take Belgium and Holland, France would be betrayed, and England would be accused of forsaking her friends. The United States is the only Great Power wholly out of it. The United States most likely, therefore, will be able to play a helpful and historic part at its end. It will give President Wilson, no doubt, a great opportunity. It will probably help us politically, and it will surely help us economically. The possible consequences stagger the imagination. Germany has staked everything on her ability to win primacy. England and France (to say nothing of Russia) really ought to give her a drubbing.

 [*All Rights Reserved.*]

If they do not, this side of the world will henceforth be German. If they do flog Germany, Germany will for a long time be in discredit.' A week later he was writing to President Wilson stating some impressions of the most thrilling week any diplomatic personage could ever experience, with all diplomacy, politics, and human nature laid most fearfully bare. At such moments Mr Page was in a position to see, and to talk, and to comprehend as perhaps no other was. One time he was with King George, who 'declaimed at me for half-an-hour, and threw up his hands, and said, "My God! Mr Page, what else could we do?"' And then he saw the German ambassador, Lichnowsky—who was always an anti-war man—in his pyjamas at three o'clock in the afternoon, and in such a crazy state of mind that Mr Page feared he would literally go mad; and the Austrian ambassador, wringing his hands and weeping and crying out, 'My dear colleague, my dear colleague!' And there was Sir Edward Grey, Foreign Minister then, and now, as Viscount Grey, returned to the full light of the political stage again, where, for his feeling, his sincerity, and his honesty, he is to all parties a welcome figure. There is a remarkable tensity and pathos in the career of Lord Grey; his was the kind of nature one would expect to be shaken and wrung and set trembling and jangling more than that of any other living statesman during those moments, some of the most overwhelming, the most fearful and fateful, the most dramatic ever lived. His peculiar sensibility, his earnest outlook, made the situation the more poignant. The world he had hoped was mending came to pieces in a crash, and then, soon after, he himself became partially—almost completely—blind. How immense was the pile of tragedy! Some years later, just when the nations, in almost frantic despair, forgathered at Washington to see if they could not arrange to save themselves from their own unceasing and seemingly unceasable folly, his sight was restored. Of all the stirring, the sensational, the tragic and overwhelming things that Mr Page, trained, sympathetic, and sorrowful observer as he was, witnessed from his unique point of vantage in those terrific days, it was the appearance and conduct of Sir Edward Grey at the time of sending the ultimatum to Germany that seemed to impress him most. It was a picture—so he told Mr Burton J. Hendrick, his biographer—that would for ever be indelibly fixed in his mind. The Foreign Minister was in tears. It was the afternoon of 4th August when the ambassador called, and Sir Edward Grey, suffering from intense emotion, made a short statement to him, passed a few remarks which indicated the implacability of the sequence of events, and the essential inviolability of the honour of Britain. He referred to the invasion of Belgium. There was a touch of finality in his voice when he said, 'The neutrality of Belgium is assured by treaty. Germany is a signatory Power to that treaty. It is upon such solemn compacts as this that civilisation rests. If we give them up or permit them to be violated, what becomes of civilisation? Ordered society differs from mere force only by such solemn agreements or compacts. But Germany has violated the neutrality of Belgium. That means bad faith. It means, also, the end of Belgium's independence. And it will not end with Belgium. Next will come Holland, and after Holland, Denmark. This very morning the Swedish Minister informed me that Germany had made overtures to Sweden to come in on Germany's side. The whole plan is thus clear. This one great military Power means to annex Belgium, Holland, and the Scandinavian states, and to subjugate France.' Sir Edward rose with a gesture of energetic nervousness; he again stood near the mantelpiece, his figure straightened, and his eyes flashed. 'England would be for ever contemptible,' he said, 'if it should sit by and see this treaty violated. Its position would be gone if Germany were thus permitted to dominate Europe. I have therefore asked you to come, to tell you that this morning we sent an ultimatum to Germany. We have told Germany that if this assault of Belgium's neutrality is not reversed, England will declare war.' Mr Page asked if he expected Germany to accept it. Sir Edward shook his head for the negative; he murmured that, of course, he did not, and that everybody knew there would be war. After a pause he added, 'Yet we must remember that there are two Germanys. There is the Germany of men like ourselves—of men like Lichnowsky and Jagow. Then there is the Germany of men of the war-party. The war-party has got the upper hand.' The emotional climax was reached. The eyes of the Foreign Minister became filled with tears. 'Thus,' he exclaimed, 'the efforts of a lifetime go for nothing. I feel like a man who has wasted his life.' 'Wasted his life.' Reflect upon that remark, made by such a man as this. Mr Page said afterwards that Sir Edward not only realised what the whole thing meant, but he showed that he realised the awful responsibility of it, and he went away with 'a sort of stunned sense of the impending ruin of half the world.' Many readers will feel that, outside what may be considered as the official facts, this interview constitutes one of the most remarkable and impressive points in the thunderous history of those August days. The circumstances and the sayings are confirmed by memoranda made by Sir Edward Grey and Mr Page, and by some comments made by Mr Page to Mr Hendrick, who points out that 'the significant fact in this interview is that the British Foreign Secretary justified the attitude of his country exclusively on the ground of the violation of a treaty; this is something that is not

yet completely understood in the United States. The fact is that had Germany not invaded Belgium, Great Britain would not have declared war—at least at this critical time.'

* * *

It will seem to many who reflect upon such momentous incidents of the other life that they may be largely instrumental in fixing the historical perspective, in influencing the final judgment, and in distilling the lessons that posterity is invited to gather from the trial for which its ancestors paid such an awful price. But what will posterity learn, and how will it point its perspective? Will it do us justice? What lessons have modern peoples learned from the past histories of Britain, France, Germany, and the United States? They seem to care nothing for the morals that are most impressively presented. How much might have been learned from Rome had later peoples been at all disposed to heed the lessons set forth, with all the morals bare, in the books of Gibbon and others? There is the conjoint history of France and Germany from fifty years ago right on, and how much has either party learned therefrom or has ever been disposed to learn? Everywhere it is the same; it seems to be the future, not the past, that alone matters for the living and those who would live keenly, as distinguished from the elderly professors and those for whom the world, for one reason or other—oftenest it is years—has lost its chief attractions. Thus one is led to believe that, whatever the period of consideration, however palpably true were its lessons, enormously important as it might appear for the continuation of life and effort that these should be comprehended, absorbed, and acted upon, nothing will ever be accepted as a lesson from the World War, and learnt accordingly, save certain points in military conduct and strategy, and the use of explosives and machines of destruction. It appears that the men of the world scarcely desire to learn anything from it, and especially wish not to dwell on the one overwhelming lesson, the only one that it can most convincingly teach, which is that War is Bad, and that if man were a creature of absolute, or even moderate, reason, he would never conduct it again; as, indeed, when he was suffering most acutely in the early stages of his last bout, he, in the manner of the sick devil, declared most earnestly, and for the time sincerely, that he never, never would. Yet regard him now, sharpening swords the wide world over; even though penniless and in want, building battleships, reluctantly, it may be; and generally behaving in a manner which surely such as view alone the historical perspective some time later may consider childish, and more than childish—contemptible; and more than contemptible—very wicked and repulsively criminal. Yet see how seriously man takes it all, as though he were concerned with reason and judgments! The serious and business-like manner in which the statesmen of the world confer upon their follies is a pathetic thing. With wars unceasingly since history faintly dawned, and little good from any of them, it does not appear that the long-matured historical perspective is of as much practical benefit as it is supposed to be in making substantial and certificated additions to the stores of reliable and helpful human knowledge. Considering the magnitude of events and of the issue, the multitude of participants and the intense variety and conflict of view upon it all, with the enduring and ever-remembered consequences, it does not appear that any dispassionate historical perspective of the World War may be reached for a very long time; not, indeed, until interest in it has faded, not until its pre-eminence in tragedy and disaster has been superseded by another and even more dreadful war. In any absolute and satisfying sense, the world will never look along such a line towards the past events, which changed the course of life on earth. Had either side been completely and profitably victorious, economically as well as militarily and politically, it might have been different. History always was a shameless toady and a hypocrite; she is a sycophant who, like mortals, has always flattered victors, and, as far as might be, praised their cause for the merits it contained, while their faults were passed lightly by. For human nature is very fallible, and human judgment at its sincerest so unsure, so varying, so susceptible. The historical perspective, therefore, is good only for the peoples for whom it is specially prepared, and even then it is obviously affected by the point of victory or defeat. If Germany had won the war, even though she had won it in that only partially satisfying sense in which we, her enemies, won, she would persistently and permanently—until a succeeding war which might reverse all procedure—have conducted a world propaganda upon causes and effects, and this, despite the outlying disbelief, must have had a permanent world effect upon opinion, and would, beyond doubt, have controlled the far perspective. Indeed, to some minds it was not the least of the dangers, the dreadful possibilities, of the war that if victory had been with Germany, this power of victory and propaganda, and the sycophantic tendencies of history, might have brought all posterity to the belief that Germany through and through was right, in the beginning and in the end, and that the Allies, with all their noble, their unthinkable, sacrifices, were wrong. Had Germany won, and had she been in the position of imposing her own system of civilisation and teaching upon the world, how could this have been avoided? There would have been dissenters from the orthodox teaching in the next generation, and still a few of them in that which followed, when the question and the

problems would have become merely academic; but in the main the world would believe what it was taught, or, at the least, as is its frequent custom, accept the teaching offered it without thinking and without cavil. In regard to what great war in the past does history with its long perspective thoroughly and absolutely condemn the victors? At the worst it will always make excuses for them, and seek out their good points for praise. On balance they are successful still! In the manner of such thought and attitudes history at times makes a show of being impartial, but there is invariably a verdict of some kind for the conquerors. It is hard to believe that conquerors are always right.

* * *

There is, again, the other consideration of the inconstancy of human judgments. Upon matters of art and literature, and upon systems of government, what we thought only a few years ago, and believed to certainty, being sure that all others who had thought differently in the past were wrong, we no longer think to-day. See the action and reaction now between Victorian and post-war systems, to take a close conjunction. For twenty years Victorianism in all its forms and manners was derided; but nothing is clearer than that from the violences and exaggerations of an abused sense of liberty, and the price in happiness and general contentment that must be paid for it, there is a strong reaction towards the care and gentleness of that Victorian system in all its ways—even if they were exaggerated, since that is a human tendency. See, we say to ourselves, how much more splendid was Parliament with Gladstone, Disraeli, and Salisbury than any Parliament we have, or could have, now. So the perfected delights of Tennyson's poetry yield now the sweetest pleasures, when it was a fashion—and fashion is the word—a few years back to think of it as maudlin and sentimental stuff, matching an era of crinolines and prudery. The present reaction now is real and true, for there is a truth of beauty which may be comprehended and felt, a truth that is fixed, as there is not a permanent truth of history. But yet in older monuments than Tennyson see the process of action and reaction. One of the great of the past who had been neglected is taken and made a vogue of, his parts exalted—a centenary is always a good thing in this respect—and new beauties and merits are discovered in him. One time it is John Ruskin, and then in another sphere it is Keats and Shelley; we make new vogues, produce new readings, afford the mind new exercises in judgment and belief. Even immortal Shakespeare has his ups and downs. Reflect even how matters of religion are being investigated and thought upon anew. Therefore, upon any given subject we may to-day establish one seemingly true historical perspective, but in fifty or a hundred years, when such subject is again the vogue, our judgment may be entirely reversed, while farther on we may be justified again. The restless world must have its unceasing change, and in the arrogance of its later information it likes to scrap the judgments of those who went before.

* * *

New lights in strange hues have been cast during recent months upon the vast events through which we passed not long ago. Few seasons have been so rich in the publication of books of biography and recollection, works of authority, of care and of value, as that which is closing now. If our literary production in present times is conspicuously weak in some departments, at least it has been strong in this. Men and women had much to tell in 1914, and before and after then, the telling of which has been delayed until now. The present yield ranges over Victorianism in its full flood, with the lives of such as Lord Salisbury and Lord Ripon, to the notes of men in peculiar positions who know things of importance about the causes and beginnings of the tragedy. Nothing is more attractive, more revealing, and little of its kind more valuable in the historical sense, than the notes produced by Baron von Eckardstein, who was for ten years First Secretary at the German Embassy in London, and was a friend of Britain. He had a way of going about everywhere and meeting all sorts of important people. Here we and those above us are observed by one from outside who indeed saw much, and the tales of Queen Victoria, of King Edward, and of the Kaiser, with his monstrous errors of tact and taste, are exhibited naïvely and conspicuously as seldom before. The baron was not only one of the good Germans, but one of those who saw through things and people, and whose vision was much more accurate than the vision of most of his countrymen. It is a good thing to introduce a spell of attention to some of the greater figures of the Victorian age by one hour of delight, as it will certainly be, with the three little playlets of 'Victorian shade and character' that Mr Laurence Housman has produced, with the title of *Angels and Ministers*. Delightful, indeed; for, though they suggest some weaknesses and foibles of that grand age, they tell also of splendid sincerities. But what they do chiefly, as they were meant to do, is to revive, in senses that still retain some latent traces, an atmosphere that is so different from that in which we live, to waft back to us from the past the rich but simple perfumes of that earnest life. Then pass from this dalliance to a story that the German baron tells us of a day and a night at Cowes, when the Kaiser and the Prince of Wales (King Edward later) were racing their yachts round the Isle of Wight. Baron von Eckardstein was with the Prince on the *Britannia*. The race lasted over long, and as

the Queen, at Osborne, was giving a dinner that night specially in honour of her beloved nephew Wilhelm, the Prince signalled to the *Meteor*—the Kaiser aboard—that they had better abandon the race and get back; to which Wilhelm answered, 'I object. Race must be fought out. It doesn't matter when we reach Cowes.' The Prince was in a natural and commendable state of anxiety; he fidgeted about and consulted with Eckardstein, but nothing could be done. And so they kept the Queen waiting, and the dinner in honour of the Kaiser, too, while they proceeded with their racing. They reached Osborne at ten o'clock, just as Her Majesty was leaving the dining-hall. The Kaiser offered his apologies, and the Queen smiled graciously, though showing by her manner she was displeased. The Prince arrived later, but took cover, as we are told, behind a pillar, to wipe the perspiration from his forehead before he could summon up courage enough to come forward and make his bow. 'The Queen only gave him a stiff nod, and then he at once retreated behind the pillar again.' It is one of the curiosities of the modern appraisement of Victorianism, and all that was therein contained, that, while the value of the Queen, to put it so, almost certainly and surely declines, the value of the people and their ways, so much influenced as they were by the Queen, increases. Baron von Eckardstein presents us with a new and original set of fascinating Victorian sketches, and he shows us how, twenty years ago, an Anglo-German alliance was in the making, though it was never made; and so life and the world turned along another way.

MAN'S WORK.

CHAPTER X.—*continued.*

IV.

NEARING the property, Sitwell contemplated the manner of their arrival. He had something of the dramatic, and this was undoubtedly drama. He would hardly have been so sure of himself were it not for the incident of the night before; but now he counted on Claudia's sense of injury to uproot whatever affection she might have retained for the man he proposed to ruin. As for the meeting, he had written the play, set the stage, and was about to ring up the curtain.

They sped past the Enterprise property. Edith glanced at the big sign with a queer little smile, and stole a look at Claudia. Sitwell apparently had not seen it, or, if he had, experienced not a single qualm. Claudia thought of the stock she held, and remained silent. Presently the cough of an engine grew louder, and they saw a derrick over the orange-trees.

'This is the piece of the anticline that was shoved over,' said Sitwell, and stopped the motor.

'Who found it?' put in Claudia suddenly.

'Come along and see.' He turned through a small gate and strode ahead. 'I expect to control this property on the 1st of September.'

Claudia was close beside him, but Edith dropped a few steps behind. There was a lump in her throat. The cheque pinned to the lining of her coat seemed to burn like fire. A short, thick-set man beside the derrick straightened up and looked round. He saw Sitwell. His face grew suddenly dark. He stared for a moment as though not believing his eyes.

'Jack, come here.'

Another man appeared, and Claudia glanced at him. Then their eyes met, and something caught at her heart.

'You!' she stammered. 'You!'

The thump of the engine continued its beat—the balance-beam rose and fell like the finger of fate—down below the bit gnawed at the hidden shale—and Claudia still stared.

Shanklin, oblivious to all else, still held her with his eyes. The sight of Sitwell standing beside her filled him with cold hatred, but for the moment this was overwhelmed in his real hunger for the woman he loved. The woman herself was robbed of speech. He pulled himself together and lifted his hat.

'Good-morning.' He did not trust himself to look at Sitwell.

Her lips moved, and Sitwell's voice came in, but a little unsteady. 'I wanted my wife to see the property, since I've got the second option on it.'

Harrison heard him and fingered a wrench, wondering how far it would sink into the smooth face. But Shanklin only smiled grimly. He would see this thing through, cost what it might.

'I'll be very glad to show her—though,' he added, 'there isn't much to see.'

Claudia listened to him as though in a dream. A little way behind her stood Edith, who had caught Shanklin's eye, and laid a finger to her lip. The same warning reached Harrison. The girl was thrilling with the fact that now she knew how it stood between Shanklin, Claudia, and Sitwell.

'You don't know Miss Winter,' said Sitwell. 'We—we brought her out for the trip.'

Shanklin advanced and shook hands politely.

'So glad to meet you,' said Miss Winter sweetly. 'Do tell us all about it. Mr Sitwell thinks you have unearthed something wonderful.'

Shanklin choked a little at that, but her spirit

stiffened his resolution. He would do this thing well, if it was the last he ever did.

'Apparently it's neck or nothing between your husband and myself'—he glanced at Claudia's pale face. 'But we're going to win out.'

She could not answer. It was uppermost in her mind that it was really Shanklin who had secretly aided her distress—and this was the return she had made for his generosity. The incident of the night before took on additional poignancy. She saw him again, the girl clinging to his arm, gratitude and admiration in her eyes. What claim had she herself on Shanklin now?

His voice went on steadily. 'It was pure luck our finding this. It will make us or break us—Harrison and me. Don't mind his looking so surly; he doesn't like women. We hope to shoot this well about the 28th of August—that is, barring accidents, which one can't foresee. Yes, I like the work; it's open air, and all that. Mr Sitwell's going to have a run for his money.'

Edith sent him a quick glance of approval, and wondered whether James Hunt could have comported himself so well. Sitwell's face was blank. He put in an impersonal word or two as Shanklin talked. The drama of the thing was somehow missing fire. He scrutinised the rig, deliberating how and when he would begin his special and private duties, but it seemed that these men were particularly able to take care of themselves. Then he examined the face of the drill-runner. Labour troubles, he reflected, were matters of everyday occurrence. They might be expected here. Presently he found himself alone with Miss Winter, his wife and Shanklin a little way off. The last-mentioned was pointing to the anticline, half a mile away.

Claudia glanced hastily over her shoulder. 'Jack—that girl in the restaurant last night?'

'Oh,' he said distantly, 'I never saw her before. There was a row, and I helped her out.'

'Forgive me!'

'For what?' He felt suddenly hopeless and weary.

'For everything. Oh Jack! I didn't know.'

'Is it any use now?' he said under his breath.

'I let you go—and I shouldn't—and I used your money—it *was* your money—for Bertie's trip to New York—the trip that put him in a position to do this. I did not know it was your property.'

'It doesn't matter—now.'

She caught his arm, and he trembled at the touch.

'But it does! What can I do?'

'Nothing—you married him.' The thing was hurting horribly, and he wanted to get it over.

'But what must you think of me?'

'I try not to think,' he said dully.

'Would it help to know that you were right—I mean, when we said good-bye?'

She made a despairing little gesture as Sitwell's voice sounded behind them.

'If you're ready, Claudia, we'd better be moving.'

She sent an imploring look. Shanklin caught it, and came to the limit of his endurance.

'Good-bye, Jack,' she whispered.

'I'm sorry our interests clash, Mr Shanklin,' said Sitwell; 'but in this game it's every man for himself.'

'And the Devil will take the hindmost. Good-morning.'

Sitwell turned, and Shanklin felt something pressed into his hand.

'That's one-fifth interest, as we agreed,' said Edith softly. 'I'll be back soon—and I think you're splendid.'

(*Continued on page 278.*)

A REMINISCENCE.

HARK! the sounds of tumult
From the cliff-girt bay;
See the billows hasting
Onward to the fray;
Sped by the broad ocean's
Mighty swell and tide,
Ever swinging forward,
Crested, tall, they ride.

Earth's rocks firmly posted,
Foremost on the flank,
Meet each rushing onset,
Break through every rank;
Shorn of strength and shattered,
Torn to lashing spray,
Billows rise as spindrift,
Spume they drift away.

Louder down the centre
Booms the battle's beat;
Joined in fierce contention,
Earth and ocean meet.
Rearing, curling, crashing,
Terrible and strong,
Come the great sea breakers,
Come in marshalled throng.

Sorely set, dismounted,
Straight the course they keep;
Surging surf, white sunlit,
Swirling currents sweep;
Rolled in whirling strangle,
Stones and pebbles groan,
Thrown, tossed, dragged, resisting,
Making hollow moan.

Nor in vain their struggle:
Broken, battles done,
On earth's shore the waters,
Quieted, spread on.

C. T. T.

THE SEVEN LAMPS OF ADVOCACY.

IV.—THE LAMP OF WIT.

By His Honour Judge PARRY.

The Seven Lamps of Advocacy are *Honesty, Courage, Industry, Wit, Eloquence, Judgment, and Fellowship.*

I.

AT the back of this little word 'wit' lies the idea of knowledge, understanding, sense. In its manifestation we look for a keen perception of some incongruity of the moment. The murky atmosphere of the court is illuminated by a flash of thought, quick, happy, and even amusing. Wit, wisely used, bridges over a difficulty, smooths away annoyance, or perhaps turns aside anger, dissolving embarrassment in a second's laughter.

Nor can '(laughter in court),' a derogatory parenthesis unknown in the official law reports, be wholly condemned among human men. 'How much lies in laughter, the cipher key wherewith we decipher the whole man!' Laughter may be derisive, unkind, even cruel, or it may be rightly used as a just weapon of ridicule wherewith to smite pretension and humbug. It may be gracious and full of kindliness, putting a timid man at his ease, or instinct with good-humour, softening wrath or mitigating tedious irrelevancy. It may be the due recognition of a witty text preaching a useful truth, that could otherwise be expressed only in a treatise; as when Common Law said unto Chancery, 'Truth will leak out even in an affidavit;' or when Erskine replied to Kenyon, who suggested that he should apply to Chancery for relief, 'Would your lordship send a dog you loved there?'

From the earliest times wit has been a light to lighten the darkness of advocacy. Cicero was noted for the jests and repartees which punctuated his forensic speeches, and these were held 'not foreign to the business of the forum.' Yet, like many a man of wit, he stumbled on occasion through the temptation of the gift, and offended some with malevolent sayings, as Bethell and others have done in our own time. It is easy to forget the poet's warning about 'the medium in all things.'

Pedants and bores resent all forms of wit, but a real humorist rejoices in nothing so much as a good story against himself. Rufus Choate was a man of great eloquence and abounding vocabulary, but he had a true sense of wit. No one enjoyed better the remark of Mr Justice Wilde, a dry, precise judge who, out of court, on occasion allowed his wit expression. He was asked by a junior if he had not heard that Mr Worcester had just published a new edition of his dictionary with a great number of additional words. Gripping his young friend's arm, he said in a perturbed whisper, 'No, I had not heard of it. But, for God's sake, don't tell Choate!'

Choate had his own wit, which charmed many juries to his clients' cause. No one could more pleasantly disperse the frowning morality of a common jury by a human simile. What could be more pastoral and poetical than his description of his clients in an Arcadian divorce case? 'They were playful, gentlemen of the jury, not guilty. After the morning toil they sat down upon the hay-mow for refreshment, not crime. There may have been a little youthful fondling, playful, not amorous. They only wished to *soften the asperities of hay-making.*' One can see the jury broadening into sympathy and smiles over the pleasantry of the final phrase.

Often the wit of an advocate will turn a judge from an unwise course where argument or rhetoric would certainly fail. Lord Mansfield paid little attention to religious holidays. He would sit on Ash-Wednesday, to the scandal of some members of the Bar, whose protests made no impression upon him. At the end of Lent he suggested that the court might sit on Good Friday. The members of the Bar were horrified. Serjeant Davy, who was in the case, bowed in acceptance of the proposition. 'If your lordship pleases; but your lordship will be the first judge that has done so since Pontius Pilate.' The court adjourned until Saturday.

But the learned Serjeant 'Bull Davy,' as he was called on circuit, could never pass a jest, even at the expense of his client. He was defending a criminal against whom the prosecution had opened a very strong case.

'Who is concerned for the prisoner?'

'My lord,' replied Davy, rising with grave solemnity, 'I am concerned for him, and very much concerned, after what I have heard.'

Wit is often the fittest instrument with which to destroy the bubble of bombast. When Curran, in an outburst of histrionic anger, placed his hand upon his heart, saying, 'I am the trusty guardian of my own honour,' it was Sir Boyle Roche who spoiled the episode by rising with much friendliness to say, 'I congratulate my honourable friend on the snug little sinecure to which he has appointed himself.'

Wit, skilfully used, is the kindliest and most effective method of exhibiting the futility of judicial interruptions.

'Where do you draw the line, Mr Bramwell?' asked a learned judge in the Court of Common Pleas.

'I don't know, and I don't care, my lord. It is enough for me that my client is on the right side of it.'

Wit and courtesy need never be divorced. They are, indeed, complementary. Wit, deftly used, refreshes the spirit of the weary judge.

Lord Chief-Justice Coleridge, writing from the Northern Circuit, says: 'Gully was excellent. His phrase, when he asked for a stay of execution "in order to consider more at leisure some of your lordship's observations," tickled my fancy very much. Misdirection was never more courteously described.'

II.

Satire or irony is often in danger of being misunderstood by the simple-minded jury. Ridicule, to be effective, must be pointed, even extravagant.

In combating the defence of Act of God set up by an American advocate defending a client on the charge of arson, Governor Wisher, for the prosecution, disposed of the theory of spontaneous combustion, and succeeded in satisfying the jury of its absurdity: 'It is said, gentlemen, that this was Act of God. It may be, gentlemen. I believe in the Almighty's power to do it, but I never knew of His walking twice round a straw stack to find a dry place to fire it, with double-nailed boots on so exactly fitting the ones worn by the defendant.'

Bowen, on the Western Circuit, was less fortunate. Prosecuting a burglar caught red-handed on the roof of a house, he left the case to the jury in the following terms: 'If you consider, gentlemen, that the accused was on the roof of the house for the purpose of enjoying the midnight breeze, and, by pure accident, happened to have about him the necessary tools of a housebreaker, with no dishonest intention of employing them, you will, of course, acquit him.' The simple sons of Wessex nodded complacently at counsel, and, accepting his invitation, acquitted the prisoner.

And as there is danger of satire being misunderstood, there is also a certain danger that an advocate, in an endeavour to shorten a case, may fail to drive home all the points he seeks to make. Modern advocates, however, are more likely to remind the Bench of Quintilian's maxim, 'There is not so much inconvenience in listening to superfluous matter as to be ignorant of such things as are necessary,' than to remember the more pertinent first principle of their own art that 'brevity is the soul of wit.'

It has always been a reproach to our advocacy that it injured its clients by calculated circumlocution, an exuberance of verbosity, and a prolixity of style and method ruinous to the widows and the fatherless and the stranger that strayed within the gates of the temple.

Good advocacy displays the highest form of wit in an instinct for brevity. The healthy appetite of judge and advocate alike is shown in a keenness to 'get through the rind of the orange and reach the pulp as soon as possible.' This wit and wisdom of Bramwell should be painted on the wall in bold letters of silver opposite every judge on the bench, and in larger letters of gold over every bench in the kingdom in the face of the nation's advocates.

Judges are, indeed, a long-suffering race, but there are some advocates difficult to suffer gladly. Mr Justice Wightman showed a Christian forbearance to Mr Ribton, who, after pounding away for several hours, began repeating himself unto the third or fourth iteration.

'Really, Mr Ribton, you know you 've said that before.'

'Have I, my lord? I am very sorry. I quite forgot it.'

'Don't apologise,' said the mild old judge, patiently stifling a sigh. 'I forgive you; for it was a very long time ago.'

How many advocates weary juries into forgetfulness by long-continued repetition of their cross-examination, often giving a clever witness opportunities of rehabilitating himself, forgetting Josh Billings's immortal advice: 'When you strike ile, stop boring; many a man has bored clean thru and let the ile run out of the bottom.'

But whatever sound maxims may be cited, it is to be feared that there will always be a line of advocacy answering to the definition of length without breadth. Nor will the old story, first told, perhaps, of Chief Baron Kelly, ever want a new and even more long-winded hero. A legal comrade of Kelly on circuit dreamed that they appeared before the tribunal on the Great Day of Judgment. Upon Kelly's name being called, and his being put up in the dock, the recording angel arose and shouted out in a loud voice, 'No other case will be taken to-day!'

Lest I should provoke a similar reproof from a devout reader, let me leave the Lamp of Wit upon the altar of justice and retire from the pulpit.

APPLIED PSYCHOLOGY.

PART II.

V.

AMONG those who clawed their way, stanchion by stanchion, to the side to see the flying boom were Able Seaman Wiggie Bennett and the ship's commander. Both cursed, the former quietly, and the latter loudly. Yet neither heard the other; the wind drowned everything but the loudest yell. Wiggie's psychology was clean forgotten; only one thing burned in his mind—as in every other mind—that until that boom was secured there would be neither rest nor peace for any soul in the ship.

The commander turned to a touch on his arm,

and confronted the surgeon-commander, hatless, a wild, anxious look in his eyes. They fought their way to where the watch on deck clustered for shelter under the break of the bridge, and tried to talk.

'Young Cocker's being driven insane by that banging!' yelled the doctor. 'He thinks he's being shelled again, and I can't soothe him the least bit. Can't you get that row stopped, Mainwaring? I won't answer for either his life or his reason if he doesn't get some sleep during the next hour.'

The commander flung out his hands helplessly. 'Tell me how to do it, and it'll be done,' he raved back. 'There isn't a chance in a thousand of securing that boom till the weather moderates. I can't even put a man over the side to try, knowing that it'd be certain death—it's a thing I wouldn't tackle myself, and I'm damned if I'll ask the men to do a thing like that! I'm intensely sorry, but I'm afraid young Cocker will have to take his chance. Here, listen, and you'll hear the men endorse my opinion.'

He turned to the seamen of the watch on deck, who, crouched in the background, had heard the whole of the shouted conversation. 'What about that boom, lads?' he called. 'Does anybody care to try to secure it? I tell you straight I wouldn't care to tackle the job myself. Well, anybody volunteering?'

He gazed intently at the men as he spoke, but it seemed to Wiggie Bennett that the commander directly addressed him. He noted the set mouth, the steely eyes, and the fierce determination of the jaw. Then he shifted his gaze and passed in review the appeal, the worried anxiety, depicted on the doctor's countenance. Something within his brain seemed to speak, and he stepped forward, the nucleus of a plan already forming in his mind. 'I am, sir,' he said simply. 'I think I can manage to secure it.'

'You know the risk you're running?' demanded the commander, for he desired to have a clear conscience in this matter.

'Quite, sir,' replied Wiggie simply. 'But young Cocker's a pal o' mine—a messmate—and I don't want him to go off his rocker—I mean, potty.'

'Right; carry on, then,' said the commander. 'Take charge of everything yourself, and give what orders you think necessary. I'll see they're carried out—and God go with you!'

'Amen,' echoed the surgeon softly, and slipped away to tell his half-crazed patient that the noise would soon be over.

VI.

The thunder of the boom crashed for the fiftieth time as Wiggie clambered to the end of the bridge and surveyed the scene, the commander at his elbow.

'It'd help if I could have some light on the subject, sir,' he remarked, and the commander snapped an order. The big searchlight on the bridge-end spluttered and blazed, its beam depressed to illuminate the tumbling water around the plunging boom.

Wiggie, descending to the deck again, seized the end of a rope and turned to two of his messmates—stout fellows and good seamen both. 'I want you to tend me lifeline,' he said. 'I leave it entirely in your hands, only don't let me be washed away entirely, and don't hold me so tight that I sha'n't be able to move. —Here,' he added, turning to the remainder of the watch, 'hand me that grass-line, and reeve the end through a block on the foremost cutter's davit there. Bend a spring-hook on the end, and one of you climb up there and lash yourself to a davit. Watch me close, and as soon as you see that I've hooked the grass-line to the end of the boom, haul as if you were pullin' Davy Jones out of his locker. Pass the hook here—that's right. Now keep your eyes skinned, lookout-man, or I'm goin' to get a wet shirt for nothin'.'

He slipped off his big sea-boots and tore off his jumper so that his movements might be unhampered. He hooked the steel hook to the rope of the lifeline knotted about his waist under his arms, and he waited till the ship commenced to roll over to starboard before dropping lightly down to grasp an eyebolt forged into the ship's plates. Steadying himself here, he found a second bolt for foothold a little lower down just as the boom crashed again, making the steel plating shudder with its violence. A huge wave reached up and grasped him, and tore him from his hold, and had it not been for the lifeline and its tenders he must have been whirled into the night like a piece of wet canvas. He swung back against the ship's side and groped for his eyebolts—and the next sea didn't dislodge him.

He took a chance, and grasping the hook in one hand—the one he kept to cling with—gathered his lifeline in the other. Then the boom crashed just below his feet, rebounding quite a foot with the force of its collision with the ship's side. Wiggie took advantage of the moment when the ship commenced to roll the other way and dropped astride the boom, his hands working frantically as he tried to snap the hook over the ring in the end of the boom itself. He had nearly succeeded, when a malicious wave grabbed him and swung him clear into the sea, hanging by the waist to his lifeline. The boom brushed him out of its path as it swung outboard again, and he swiftly realised that he must be hauled out of the way before the ship rolled back, or be crushed between the boom and the hull. But he had chosen his lifeline men well, and he was hauled well up the ship's side in plenty of time.

His eye was caught by the wire-rope which held the boom horizontal, and he leapt for it like a cat. He risked a severe crash, but his fingers gripped it safely enough, though they

couldn't hold. They were wet and the wire was greasy, and the combination sent him slipping towards the downward canted boom-head as it once more played submarine. The skin ripped from his hands, but he clung on until the rush of the boom under water threatened to drown him and dragged him away from his hold.

'Damn!' The word was the signal that he had lost his temper; that henceforth it was a struggle between him and the boom, with his life at stake. He had forgotten all about Cocker, or the reasons why he had attempted the perilous task; he was now only burning with an urgent desire to show that mass of inanimate steel that there were still men in the world who could master it. His crash against the ship's side as he was again hauled clear of the water made his head sing and his brain wonder if he had any unbroken bones remaining in his body, but it didn't damp his determination in the slightest.

The next roll he caught the boom within a foot of its head as it commenced the outward journey with the roll to port, clasping the quivering steel, circular in section and slippery with water, with his legs. With both arms he tried to snap the spring of the hook over the boom-head ring, and was within an ace of success when the sea beat him again, and he once more found himself tumbling helplessly among the waves.

And now he went *berserk*. He raved and shouted and cursed; he said things that would have shocked his shipmates with their sheer blasphemy, that would have surprised the most fluent harridans of the streets and slums. He cursed the waves, and the wind, and the boom, and the salt that bit into his lacerated fingers. Then he cursed his lifeline men, and made signs for them to haul him up.

'Chucked it, Wiggie?' asked one when he clung to the bridge-end stanchion, soaked, chilled to the bone, bruised, bleeding, and breathless.

'Chucked it be damned!' he snarled back. 'I chuck nothin'. Here, make this lifeline fast so that it gives me six feet of loose end to play with, and shove me over again a bit farther aft. Let me have plenty of rope, and don't, for God's sake, haul me in till I fall in the ditch clear of the boom. It 's neck or nothin' this time.'

VII.

They put him over, and he commenced to take chances—enormous chances. He caught the very tip of the boom as it crashed—three tons of steel driven by the whole force of the ship's rolling momentum and all the winds that blow—within a foot of his body. He caught it on the rebound, and flung himself lengthwise on top of it. Clinging with his legs, he passed the loose end of the lifeline around the boom and his body, gripping the hook with his teeth the while. The rope held him secure, and, transferring the hook to his hands, he grappled with the senseless ring at the boom end and the bill of the hook, trying to make them meet.

Down, down, down plunged the boom as the ship rolled to port, and outwards swept the steel flail with an irresistible rush. The water welcomed it, and the body of the man who clung to it, but the wild waves couldn't tear him free because of the lashing. It seemed to Wiggie that he went miles below the surface, till the lifeline around his waist compressed his flesh fiercely; till something in the nature of an iron clamp tried to crush in his forehead; till his lungs threatened to burst; till something at his finger-ends seemed to give way with a snap, and he knew the hook was well and truly secured at long and bitter last.

His work was done; he tore at the lashing round his waist as the pressure on his head and lungs began to ease—the boom was again rising—but he couldn't find the end. He felt himself lifted clear of the sea, and then . . . .

The petty officer watching from the boat-deck and the commander looking from the bridge shouted together. 'Race away with the grass-line for your lives!' they yelled, both using the same words. The watch on deck, from whom the whole scene had been hidden, were tense for the order, and they obeyed it with a will. They checked for the merest instant as the weight of the boom made itself felt; then they hove heavily and went aft at the run, the rope in their hands.

'Oh Gawd!' wailed one of the lifeline men; 'jerk him off it, or he 'll be squashed.'

They jerked—Wiggie wore the mark round him like a belt for weeks—but they didn't dislodge the body now flying through space as the boom made another rush towards the ship. He was still fast to the boom when it crashed home—but the watch on the grass-line had hauled the head up a clear five feet above the ship's bulwarks, and thus saved him from mangling.

Like a stone from a catapult, as the steel crashed home for the last time, the helpless body of Wiggie Bennett flew through the air and—well, they congratulated the breathless and adipose carpenter whose body had chanced to interpose itself between Bennett and the hard deck planking. Then, while part of the watch made sure that Wiggie's work should not be in vain by securing and treble lashing that boom with wire-ropes and chains, a round dozen men hurled themselves upon the raging Bennett, who swore strange oaths about a 'blarsted boom beatin' him—he 'd show it, the asterisked thing.'

They bore him to the sick-bay, and held him, foaming at the mouth, while the surgeon made a hasty but thorough search for damaged bones. Then, finding none, he clapped Wiggie incontinently into a strait-jacket lest he do himself injury, and finally did things with a hypodermic

syringe, so that presently Wiggie forgot all about such things as booms and winds and waves for a space. And in the next bed a white-faced boy smiled wanly at the chief sick-berth steward when the latter told him Wiggie had effectually silenced those guns which had so terrified him.

VIII.

Ten days later, as the newly promoted Petty Officer Wiggie Bennett was sitting on deck, convalescent from his bruises, sewing on the sleeves of his jumpers the badges of his brand-new rank, there approached him one Jumper Collins, a full private of the Royal Marine Light Infantry.

'Hullo, Wiggie!' he remarked; 'glad to see you about again, old son. But,' he added with a grin, 'I ain't never properly understood why you didn't apply that psych—psychology of yours to the boom, and send your occult guide out to secure it for you.'

Wiggie looked at him pityingly. 'You *wouldn't* understand,' he snapped shortly. 'You've got a mind that understands nothing above a meal. But, since you're so curious, I don't mind tellin' you that I did apply psychology to the problem, and formed a theory —a practical one, as this here new ratin' of mine shows. You see, I watched the commander's face, and saw as he was a bit scared of askin' us chaps to do somethin' he'd not care about doin' himself, and that, if anybody did secure that boom, they'd get a reward commensurate. See? My occult guide, havin' no terrestrial body, couldn't do the trick without me, and I couldn't do it without him. He told me what to do, and I did it; he told me, also, that there was a first-class petty officer's rate hangin' on to success, and he was right—as right as the time when he told me you were a liar, and the officer of the watch confirmed the statement. That's right, you blighter, grin a bit more, and I'll ask him to send me down a message to guide the toe of a psychological boot against your unbelievin' carcass, you—you clutcher of mud, you!'

But, to put psychology, applied or unapplied, aside, it was really the fact that young Cocker grew to his right mind, and that the parson chose the text 'Greater love hath no man' for his Sunday's sermon. That gratified Wiggie. The first-class rate was only a side-line. But you can't let a marine—and a *red* marine at that—have the best of an argument, can you?

THE END.

THE NATIVE MATCHLOCK.

By Lieutenant-Colonel J. W. WRAY.

I.

ONE desperately hot day, in one of the hottest stations of India, with the thermometer standing at anything between 115 degrees and 117 degrees in the shade, and life a burden, we in the Mess were trying to forget our midday miseries by playing 'Fly Loo' after lunch. Fly Loo is about the only game that can be played in that temperature, as it requires no exercise of intellect or fatiguing effort of any kind. All the players have to do is to sit round the table, each with a piece of sugar in front of him, and he on whose lump of sugar a fly first seats itself wins the game, and becomes the possessor of the stakes, which, of course, are quite nominal. The excitement is intense, and the simultaneous shouts of claimants dispel all forebodings of heat apoplexy and the consciousness of discomfort from the stifling atmosphere.

During one of these entertainments a Mess waiter whispered to me that a villager was outside, and wanted me urgently.

I slipped away from the excited players, unobserved and unquestioned, as it was far too hot and the game far too absorbing for any of them to interest themselves in other people's affairs; and I was glad of this, for I knew that the summons meant news, which I had been expecting for some days, of a large tiger, and, selfish as it may seem, I was anxious to go after him alone, as the jungle, which he had been monopolising for some time past, was not big enough for more than one gun.

On reaching the veranda I found a breathless and streaming villager, who had come in with a message from my 'shikari,' or tracker, to say that the tiger had killed a cow, where I had expected, on a small wooded hill, fifteen miles away. He had eaten a portion of the carcass, and was lying in a small wooded ravine at the bottom of the hill, and the shikari had placed men in the vicinity to see that he was not disturbed.

It was then 2.30 P.M., and there was no time to be lost, for at sunset he might be moving again. I hurried to my bungalow, taking the villager with me, gave him my rifle, and told him to go on ahead with it, and that I should overtake him, for I did not wish to be seen passing the Mess carrying the rifle myself, for the reasons above stated. I then changed into my khaki clothes, left a note for the adjutant in case I had to sleep out of barracks, mounted my pony, and started.

After going about a mile I wondered what had become of the man with my rifle, and thinking he must have picked up a camel and gone ahead, I continued to gallop on, fearing to lose time by going back or hanging about to look for him. At last I concluded that he must

have taken a different track, and that I must have passed him (which turned out to be the case), and I made up my mind that the only thing to do was to go to the village and trust to finding some sort of gun there, and take my chance with it and the tiger.

At four o'clock I reached the village, and found my shikari, who was a hot-tempered person, very much exercised in his mind as to the lateness of my arrival. He told me that the tiger was still lying up, and it was a certainty that I should get a shot if we hurried on, and he was so busy saying 'Come along, sahib,' that he did not notice that I had no rifle with me. I had to break it to him, however, and he was much concerned, and showed it by cursing all the ancestors of the man who had failed me, and had thus deprived me, as he said, of the biggest tiger that had ever been known, and so on. I told him that it would be all right if we could raise a couple of matchlocks in the village; but he demurred, saying there was no tree to sit in, and, as that meant standing on the ground, it would be too dangerous to attempt the tiger so inadequately armed as I should be. I explained that this could not be helped, and that I meant to take my chance if only I could get hold of a gun of some sort. He shrugged his shoulders and said, '*Nasib ka bhat*' ('It is a matter of fate'), and in a few minutes he had procured a couple of old village muskets, some coarse gunpowder, and a few bullets.

These guns have a very small bore and an immense length of barrel. On the hammer is a pinching contrivance holding a piece of cotton which, when the trigger is pulled, descends on to a small round pan, at the bottom of which is a hole communicating with the powder in the barrel. Immediately before use the round pan is filled with loose gunpowder and the cotton is ignited and smoulders. When the trigger is pulled, the lighted cotton-wick, descending on to the loose powder in the pan, ignites it, and after about half-a-second's fizzing, the powder in the barrel is reached and the gun goes off. I have described this rather particularly, because that half-second's interval between pulling the trigger and the shot nearly cost me my life.

II.

We lost no time in loading the two antiquated muskets, and, shouldering one each, we started, the shikari giving one more anxious look round for the man with my missing rifle, and muttering more curses on him for not appearing. A few minutes' walk brought us to the 'kill'—the carcass of the cow—and we were satisfied that enough had been eaten by the tiger to make him lazy and inclined to lie up close by, and also that he had left enough to keep him there looking forward to another meal that night.

The nullah, or small ravine or hollow, ran along the bottom of the hill, and continued round it to the lower ground beyond, and towards the big jungles which we knew the tiger would make for when roused.

The ascent of the little hill commenced, as it were, immediately out of the ravine, and though it was a short cut to the big jungles, we imagined that the tiger would feel too slack to climb over the steep hill, when he could make his point by sneaking quietly round it through the bushes of the nullah. I therefore placed the beaters (there were only a dozen or so required) above the 'kill,' and told them to walk quietly down the hollow on each side of it, clapping their hands gently, but not shouting. It is only when the area is large, and the exact whereabouts of the tiger is unknown, that it is necessary for beaters to make a great noise. It is much better, in beating a small place for a tiger that is actually located, to rouse him gently and let him walk quietly in the direction that he wishes to take, rather than to frighten him into breaking away unseen.

The shikari and I were so confident that this tiger would choose the easier and more secluded way down the hollow that we did not waste time in placing 'stops' to guide him along it. So, telling the beaters to wait till we were in position, we crossed the nullah, ascended the opposite slope of the hill for about twenty-five yards, and took up our position.

It was October, and the grass was very high. There was no tree worth getting into, or from which I could get a satisfactory shot, so I selected a large stone in the long grass, from which I had a capital view of the path which I thought the tiger was bound to take, from left to right, and I fixed upon the spot which he should reach before I fired at him, where there was a little opening in the bushes past me, as it were, to my right front.

The shikari I insisted upon placing in a small tree a little higher up the hill; and giving him one of the matchlocks, I took the other, lighted a piece of cotton and filled the pan with gunpowder, and took up my position on the stone. I then signalled to the man who was to communicate with the beaters, and the beat commenced, and not a bit too soon, for it was now nearly five o'clock.

III.

In a few minutes I saw the tiger's tail above the bushes, and then I saw him clearly wending his way through them, coming slowly down the hollow. In a moment he was opposite. I brought the gun up to my shoulder, and was on the point of firing, when, to my astonishment, instead of keeping along the nullah and passing the open space I had selected for the shot, he swung round and turned sharp up the hill towards me. In another minute he would be passing me within a few feet. I slipped down quickly and silently from my stone and lay on

my face in the long grass, with the musket up to my shoulder, and waited.

In a few seconds the grass was waving close to me, really not much farther than the length of the musket, and the tiger was stalking slowly past me. I waited till his head and half his body were past, and then I fired, thinking my little bullet was bound to go straight through his heart, and that he would bound forward and drop dead. But I had forgotten about the fraction of a second which had to elapse between the pulling of the trigger and the shot, and my bullet, instead of striking behind the shoulder, penetrated the tiger's body too far back, missing the vital parts. He gave a bound in the air, roaring terribly, and began, so far as I could judge, to go round and round in a circle, biting, I supposed, at his wound, as I have seen tigers do. There was nothing further to be done, as I was unarmed and there was no possibility of running away; so I lay perfectly still, hardly daring to breathe, and awaiting events. I confess I made up my mind during those few moments that if the tiger would go away I would give up tiger-shooting for the rest of my life, for I can say without exaggeration that he was sometimes within a foot of me; and though he did not actually touch me, yet the long grass that he disturbed seemed positively to wave over my head and back, and his angry growls, as he rolled and twisted about all round me, were deafening. It was a marvel that he did not discover me, but he made such a noise that he could not have heard me breathing, and he was far too angry with his wound to think of anything else for the moment.

Of course, the suspense seemed longer than it really was, but it was soon over. The grass round me grew gradually still again, and I knew the tiger had gone. I waited, as I was, for the shikari's signal, for I was sure that he would communicate with me as soon as he thought it safe to do so. In a minute or two I heard the low whistle, and I got up and went to his tree. He pointed up the hill, and gave me his matchlock. I lit the cotton, filled the pan, and started in the tiger's track, which was easily discernible through the long grass. I knew from the shikari's signs that he had gone over the brow of the hill; I therefore felt safe in hurrying as far as that, hoping to get a view of him from the top. Just before I reached the brow, however, I saw him emerge from a little dip in the ground and go slowly on to a large slab of rock and look over the edge of it. Finding it too steep to descend in his wounded condition, he halted and turned broadside to me, his length outlined against the sky. While he hesitated, looking round him, I fired. He reared up on his hind-legs, twisted half round, gave a great plunge forward, and disappeared over the edge of the rock. I knew that this time he was shot through the heart, and had fallen over where he had found it impossible to descend. I waited a few minutes, and then went up to the slab of rock and looked over; but all was still in the dense forest, below and beyond. I whistled to the shikari, who came up, and we waited for a little. Finally, determining that it would be folly to look for the tiger in the rapidly increasing darkness of the evening, we started back for the village, where, as I had no duties in barracks next morning, I resolved to stay the night.

I invariably carried in my saddle-bags enough for a small meal in case of necessity. The villagers produced some clean rice-straw, which they spread in the veranda of one of their little houses, and I had a fairly comfortable night. In the meantime my rifle had arrived, and I looked forward to finding the tiger next morning where he had fallen.

At dawn we started again, the shikari and I, and going round the hill to the far side, we made straight for the spot where the tiger had plunged over, and there we found him dead.

The first bullet, as I imagined, had hit him too far back to be immediately fatal, and though he would probably have bled to death later on, it might have been a matter of days. I was glad, therefore, I had had the other matchlock to follow him up with, for the second shot must have killed him instantaneously.

THE MONTH: SCIENCE AND ARTS.

SECURE LOCKS FOR HOTEL BEDROOMS.

OUR February issue contained a description of a new type of door-latch with a very small key. Since then our attention has been called to an ingenious bedroom-door lock for hotels, clubs, and public institutions. For this service the conditions differ from those for the ordinary door-latch in that provision has to be made for chambermaids' keys and the hotel manager's masterkey, as well as for those of the guests, the last-named keys, of course, being all different. This is effected in most hotel bedroom-door locks by making the levers and the notches for them alike in each key, and forming, at the sides of the projecting part, differing notches which fit wards in the lock. With this system a visitor having designs upon the property of his fellow-guests has only to file out the notches at the sides to make his key fit any door, and this has actually been done by hotel thieves. In the new lock each set of levers and its key are different

from all others, so that no guest's key will unlock any door except that of his own room. Yet the chambermaids on each floor can get in with their masterkeys, while the manager, with his grand masterkey, can enter any room on any floor. In addition, he can with his key check-lock any door, so that no other key will open it, and the lock cannot be turned even by means of the knob inside the room. The system is really very simple when one understands it. Two sets of levers are worked through one keyhole, and either set will open the lock. The guest's key operates one set, the chambermaids' and manager's keys the other. By a backward turn of the manager's key the latch is check-locked, and then even the chambermaid's key is powerless to open the door. The lock is made with a knob inside the door and a keyhole outside, and merely closing the door locks it. Further, the latch and the receiving plate are so formed that only a very light pressure on the door is enough to lock it. In hotels the chambermaids' keys are usually different for each floor, but with this design of lock there is no limit to the variations that can be made in this direction. Finally, these locks are all made by hand, the makers contending that equal results cannot be obtained by machine-work. Moreover, with this system the numbers of identical parts are necessarily very limited.

A FOLDING STOOL FOR SHOPS, BARS, FACTORIES, &c.

In many shops, more especially those frequented by women, chairs are provided for the customers; indeed, the 'sex' would refuse to patronise many kinds of establishments where seating accommodation was absent. That chairs are very much in the way in such places is freely admitted, and to overcome the difficulty an ingenious form of stool has been invented by an Australian. When in use, the top of the stool, which consists of a round wooden seat, is horizontal and at the correct height for sitting upon. In this position the front of the seat is supported on two steel legs, which are hinged under it in such a manner that it can be turned up so as to be vertical. The lower ends of the legs are hinged to a cast-iron base firmly fixed to the floor close up to the customers' side of the counter. To make sure that when the seat is in use it shall stand at a convenient distance away from the counter, the legs are made to slant outwards. Between the two legs already mentioned is a third, which is hinged below the back part of the seat. This leg passes between the front pair, and is hinged to the base a few inches nearer the counter than they are. Looked at from one side, the legs almost resemble a gigantic pair of scissors, and as the middle leg crosses from the back of the seat to the front of the base, it is much more sloping than the others, and is, therefore, considerably longer. Now, if the seat is pushed towards the counter, it moves upon its hinges in such a way that it is tipped up and comes to rest in a vertical position against the side of the counter, where it is stowed out of the way, ready to be pulled out when required. By reason of a bar between the two front legs acting as a stop upon the middle leg, the seat cannot be pulled out beyond a certain fixed distance. These stools are, of course, serviceable wherever the ordinary form of stool is used, and are also capable of taking the place of chairs with advantage in many cases. If desired, the stool can be supplied with a small leather back.

TRAILER BODIES FOR MOTOR-LORRIES.

After a period of reckless extravagance, in which the demand for every commodity exceeded the supply, we seem to have entered upon a series of lean years, when every possible economy must be effected in most industries, if they are to carry on at all. This condition applies especially to motor transport, which is 'up against' keen competition from the railways; hence considerable interest attaches to a device recently brought out which increases the carrying capacity of motor vans and lorries. It takes the form of a larger body, supported at the rear end by a pair of trailing-wheels, the front end being carried on a swivelling attachment over the driving-wheels. The body proper is of the lorry type, with hinged sides and tail-board, while a well similar to that to be seen below pantechnicons is arranged under the floor. A detachable van-top, made of three-ply wood, fits over the body. The swivelling attachment supporting the forward end consists of a hollow pin which holds the body down on the chassis, but the forces tending to slide the one on the other are taken by cone blocks. Provision is made for movements in other directions by a sprung trunnion frame. The back-wheels are fitted with ball-bearings and pneumatic tires and brakes, the last-named being worked by wire cables passing through the hollow pin at the swivel-joint, to which reference has been made. The trailing-wheels having larger brake-drums than those on the driving-wheels, together with longer levers to the brakes, the body has a slight tendency to draw apart from the chassis when both sets of brakes are applied, as those on the trailer are the more powerful. Hinged legs with lifting-jacks are provided under the forward end of the body, and these are brought into use should it be desired to detach the chassis for other purposes during the process of loading or unloading the body. With this trailer almost any commercial chassis can carry a greatly increased weight, while the cubic capacity is proportionately augmented. A one-ton Ford chassis, for instance, is converted into a 30-cwt. vehicle, and the capacity of the body is increased to 320 cubic feet. The trailer does not prevent the vehicle from running on reverse,

although, no doubt, a driver would require some practice before he could steer backwards on any desired course.

A SIMPLE TOOL FOR TRUING-UP MOTOR CRANKPINS.

Although primarily intended for garages and repair workshops, a tool that has lately been brought out for truing-up crankshafts should be found useful by those who own several cars, and who keep a chauffeur-mechanic. The driving pressure of the piston, together with that due to compression, comes on one half only of each crankpin of a motor crankshaft, the pressure during the exhaust-stroke being comparatively light, while on the suction-stroke there is an upward pull. Owing to these conditions, crankpins are very apt to wear down on one side much more quickly than upon the other, and in time they have to be trued-up. If done by hand this operation is a lengthy one, and requires a considerable amount of skill. The alternative is to send the crankshaft to the makers for the pins to be ground up by special machines, involving delay and an appreciable expenditure. The tool referred to consists of a cast-iron frame, more or less in the form of a disc, with a big hole in the middle. It is provided with four radial slots, in which slide three guides and one cutter, the distance of each from the centre of the hole being adjusted by a radial screw. The frame is split and bolted together, so that it can be opened and put together again round the crankpin to be operated on. This having been done, the guides and the cutter are screwed down on to the pin. The guides are pieces of hardened steel with T-heads, the heads presenting a narrow, flat surface parallel with the crankpin. Except for its cutting edge, the cutter is almost identical with the guides. The edge is perfectly straight, and is exactly parallel with the central line of the crankpin. A bar at one side of the frame gives the operator enough leverage to rotate the frame, causing the cutter to turn off the lump or lumps on the pin, so that it is made perfectly round again. Crankpins of from 1 inch to 2⅜ inches in diameter can be trued-up with this tool in from five to fifteen minutes, according to their size and condition. Pins of different lengths are dealt with by moving the tool endways while turning it. Means are provided for holding the guides and the cutter exactly true when operating.

THE PRODUCTION OF POWER ALCOHOL.

The idea of extending the use of alcohol instead of petrol for propelling motor-cars and aircraft is an attractive one for several reasons. First and foremost is the possibility of breaking down the ring which is maintaining at an artificially high figure the price of petrol in this country. Secondly, alcohol, which is ordinarily produced by the fermentation of sugar derived from vegetable matter, would be manufactured within the Empire, whereby the British Isles and our colonies would be rendered independent of imported petrol. Thirdly, the supply of raw material is practically inexhaustible, instead of there being only limited quantities to draw upon, as is the case with petroleum and coal. Alcohol is not used by itself for motor-cars, as it will not vaporise when cold. But when mixed with petrol, benzol, or ether, it functions quite satisfactorily. One well-known alcohol-fuel is mixed with ether, which is made from alcohol. The Fuel Research Board has been investigating the problem of Empire-produced power alcohol for the last few years, and an interim memorandum on fuel for motor transport was issued in July 1920. A second memorandum has been published recently, which is not very encouraging reading for those who believe in Empire-produced alcohol as an alternative to high-priced petrol. The Board does not consider it possible to grow in this country enough raw material at a sufficiently low price to produce alcohol therefrom. The position in our colonies is more hopeful, but even in them there seems little likelihood that the production of alcohol will meet the home demands for motor spirit, which are rapidly increasing. Tropical vegetation and waste vegetable matter offer the most hopeful sources of raw materials, but so far no commercially sound process for producing alcohol from them has reached a stage where its industrial application can be practically considered. In the meantime the Board is continuing its researches, with the object of discovering a method, suitable for application on a large scale, of obtaining alcohol from the cellulose of plants by converting it into fermentable matter by chemical or bacterial processes. It may also be noted that the Board does not consider the synthetic production of alcohol on a commercial scale to be at all likely in this country, but where electric-power can be produced very cheaply, as in Canada and Australia, it suggests that it might be possible.

A PETROL TREE-FELLING AND LOG-SAWING PLANT.

The petrol or paraffin motor has lightened or almost eliminated hand-labour in many directions. One of these is the felling of trees and the subsequent sawing up of the logs into convenient lengths. If performed by hand these operations are very slow and laborious, a huge saw being worked backwards and forwards by two or more men. The Christmas Number of this Journal for 1920 contained a paragraph describing a log-saw which was worked by a petrol-engine. Since then a similar appliance has been brought out which not only cuts up trees already felled, but does the necessary felling as well. So far as the former operation is concerned, the outfit closely resembles that

previously described. It consists of a 2¼-horse-power petrol motor mounted upon a wooden frame, at one end of which is an axle-tree for two wheels. The motor drives a cross-shaft by a chain, this being fitted at one end with a pinion, which gears with a toothed wheel on a short, stout spindle. A crank-arm on the spindle works the saw rapidly backwards and forwards through a connecting-rod as the spindle rotates. The saw is fixed to a cross-head which slides between two parallel guide-rods, and this part of the apparatus turns on the spindle as a fulcrum as the saw cuts downwards. Extension-pieces to the motor-frame pass across the top of the log and are spiked firmly to the timber. The other end of the outfit is supported by the two wheels, each of which is swivelled round on its end of the axle-tree, so as to lie at right angles to the motor-frame. Locked in this position by big pins, the wheels are in line with each other, and correctly placed for moving the saw along the log for the next cut. With the wheels in their normal position, the outfit can be picked up at one end by one man and wheeled about. For felling trees the saw, with its driving-gear, is detached from the motor-frame and laid on its side against the trunk of the tree, the spindle being driven from the cross-shaft by a rod having a universal joint at each end, so that exact placing of the motor is not necessary. This rod drives the saw through an extra pinion specially attached for tree-felling, while screw feeding-gear is provided for pushing the saw inwards as the wood is cut away. The spindle end of the saw-frame is supported on a steel bar bent in the form of a broad inverted U, the legs of which are driven into the ground. Conversion of the log-saw into a tree-felling saw, or *vice versâ*, takes only a few minutes. The motor is of the horizontal type, with its cylinder in a big square water-jacket which forms the cooling-tank; the ignition is by a magneto. It is, therefore, quite self-contained.

LOCKS FOR UMBRELLAS, COATS, AND HATS.

Almost every one is reluctant to leave a good umbrella in a public stand at a restaurant or even a club, in case somebody else should walk off with it, either accidentally or by design. On a wet day umbrellas make pools of water, and become a nuisance; if they could be safely left in a stand or a rack, it would make for the convenience and comfort of every one concerned. A very ingenious lock for umbrella-racks which provides the necessary security has been in use in the United States for some years, but is little known in this country. The device consists of a rectangular box measuring 3¼ by 2⅝ inches, and about 1 inch deep. In the front of it is a recess for the handle of the umbrella, which is nearly filled by a sliding piece. When the umbrella-handle is pushed into the recess the sliding piece is forced back and a bar shoots across in front of the handle, thus securely holding it. Fitting into a slot at the back of the box is a key, in the form of a metal plate (numbered, and stamped with the name of the restaurant, club, or other institution), about the thickness of a penny-piece and measuring 1¼ by 1¾ inches, so that it is easily carried in the pocket. This key is provided with grooves, which are different in each key. To obtain possession of the umbrella again, the key must be replaced in the lock and pressed down, when the umbrella is at once released. One peculiarity of the invention is that the key is held fast when the recess is open, and can be taken out only after the device has been locked. It would be useless, therefore, for some evilly disposed person to take away a key in the hope of finding an umbrella in the lock on his return. Rows of these locks take the place of the usual wall racks, and a customer at a restaurant, for instance, may push his umbrella into one of them and take out the key, knowing that it is impossible for any one to run off with his property while he is having a meal. A minor feature is that when the key is inserted in its slot and pushed down, the umbrella is shot out into the other hand, a deep pot into which the point of the umbrella fits preventing it from falling down. These umbrella-locks are made in oxidised steel or with the outside nickel-plated. Masterkeys are provided with every three dozen locks, and the keys and the locks have corresponding numbers. Locks and keys of the same type are also made in the form of coat and hat hooks. In the device intended for a coat only, the collar is placed over a hook having a wide end, which does not pull it out of shape. Then a clip, of which the stalk slides through the lock, is pushed down, and grips the coat at the back of the collar. The key having been removed, the coat is securely held until the owner's return. Both coat and hat can be secured by a similar lock with a slightly different form of clip.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (*a*) a reply post-card, or (*b*) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

SEVENTH SERIES

SIR MALCOLM'S HEIR.

By ROSALINE MASSON.

PART I

I.

RONALD MACKENZIE found his uncle's country home dull in the day-time. At night he enjoyed the luxury and quiet and 'flavour' of the fine old library, which he had pretty much to himself, as the old gentleman retired early; but the day-time in the country was to him wasted when the season provided no sport.

'I shall see nothing of you after the Twelfth,' his uncle had written, 'when the others arrive, and you will have to do host. I hope you will enjoy yourself then. I hear the prospects are exceptionally good this year. But will you come, my lad, a week sooner, and give a little enjoyment to an old man? It is months now since I have seen you; and I am reaching the age when every month makes an appreciable difference in what I can count on.'

'"Reaching the age,"' Ronald had thought, as he folded the letter. 'Why, the dear old chap must be nearer eighty than seventy! What a spirit he has! And what a beast I am to have neglected him so long!' But his conscience was quieted by the subconscious knowledge that he had always felt diffident about offering himself too much to old Sir Malcolm, whose favourite he so obviously was, lest it should seem done with the purpose of ingratiating himself. For there were others, who cared not a jot for the cynical, scholarly, lonely old man; spoke of him harshly, and even rudely, behind his back; and who yet—bah! His uncle would understand; it was they who kept him off. He did care; but one couldn't always be saying it. He was always there when wanted. And so he wired, 'Expect me next Tuesday, if convenient,' and arrived sunny and cheerful, sympathetic and deferential, as was his nature; undemonstrative, as was his nationality; and brought unwonted sunshine into the old man's days.

'It will all be yours, Ronald,' Sir Malcolm had said to him only the night before; 'the title—such as it is, and not to be despised at that. James VI.'s creation—and given for State service, not for money—and the line has been a good one, before and since. Well, the title goes to you, and is no gift of mine. But all I have to give I give to you, my dear lad.'

'You're awfully good to me, sir; but the others——' began Ronald.

'That's my affair,' his uncle answered, raising his hand and letting it fall again on the polished table—his old hand, the veins standing out, blue and knotted, the finger-joints white as ivory, the long fingers, the filbert nails polished, the signet-ring on the little finger. 'That's my affair,' he repeated, and his blue eyes looked gray as steel.

'Certainly, sir—of course. But I can't help it—I don't want——'

'I quite understand, my boy. But no wrong is done. They are all well off, and they spend their money as they like—not as I approve. They even buy me presents on my birthday, Ronald.' He smiled inscrutably. 'You forgot my birthday——'

'Sorry, sir!' Ronald looked up contritely.

'I wasn't. I liked your forgetting it. They count my birthdays. Well, well—never mind! Poor Edward—he's a weak sort—speaking within the family; but his wife is an intolerable woman, Ronald. Intolerable! Her "Deah Uncle!" is enough for me. If your claims rested on that alone, they would be on a sure foundation.'

'Oh, she——' began Ronald.

'Yes, you're young. When I was young I excused all women.'

Sir Malcolm's thoughts wandered a little; he remained silent. Ronald helped himself to some grapes, and respected his silence. The old man poured himself out a glass of port, sipped it appreciatively, and began again where he had left off.

'But, as I was saying, there is no wrong done. They have plenty, and you have very little—oh yes, I know, you are doing very well at the Bar—I hear more than you tell me; but still, the old place takes a lot to keep up. I should like it kept up, and you are the right sort. You are the sort I once thought I might—well, I should like the line to go on. Why don't you marry, boy? I haven't very long, and I should like to know her—to see you here—Ronald. Is there no one yet?'

 [*All Rights Reserved.*]

The young man laughed and flushed. 'Not —not exactly, sir. Nothing definite.'

Sir Malcolm's keen old eyes rested on him searchingly, and their steely grayness melted into blue. The fine old scholarly mouth relaxed into a smile.

'A little girl somewhere, eh?' he hazarded.

'Little girls everywhere, sir!' the boy answered joyously.

'I'd like to see one settled here. Can't you choose?'

'*They* choose, nowadays, sir.'

'Always did. At least, the right sort. And take the advice of an old man—if one of the right sort chooses you, be chosen! Marry her! Marry her before she repents!'

And now, in the warm freshness of a Scottish morning in August, Ronald was walking alone on the heathery hills, wondering what experience of his uncle's had given rise to the not altogether complimentary advice. Had his aunt, whom he did not remember, been the one who had chosen? And, if so, had she repented? Or had she been the one his uncle chose instead of the other, who was 'the right sort,' and whom Sir Malcolm had not married? Ronald's experience of life was not great, but even with the knowledge he possessed, he inclined to the second surmise. It is more often the negation that retains the pedestal. There is no article of domestic furniture that suffers more by 'wear and tear' than does that pedestal.

II.

Two days till the Twelfth, and the incursion of a house-party. He would not be sorry—the days on the moors were misspent till one had a gun. To-day he had to himself, for Sir Malcolm had his agent over for the day, and Ronald, pleading need of exercise, had said he would not return till eight o'clock dinner.

The moors sloped down to a broad river, which was the march. Ronald tramped along the side of it, up-stream, to face the wind. Presently he became entangled in a fir-wood, and then again he came to another stream, and crossed it. He knew the country pretty well, and, had he given the matter a thought, would have realised he was no longer on his uncle's land. But his thoughts were elsewhere. They were, as a matter of fact, hovering over those 'little girls' with whom he danced and supped, played golf and tennis, rode and flirted; and he was putting each of them in turn—apologetically and chivalrously—to the severe test of imagining her sitting opposite to him in that library of the house he had left, which he had learnt was to be his. Far back in the big chair opposite him he placed them, one by one. He was conscious of each picture in turn—the pretty bobbed heads and little powdered noses against the dignified red leather and carved oak; the long, slim, silken legs crossed and dangling below the scanty skirts; the young eyes that held so much knowledge forbidden to their grandmothers, wandering dully over the walls of books that held so much more knowledge, disregarded by a generation given over to utility; the little hand, with the interminable cigarette between the nicotine-stained fingers; and yet, so pretty—amusing, too, some of them.

Reluctantly, and yet irresistibly, Ronald introduced a third on to the scene—his uncle—and watched the keen, cynical eyes, with the little hint of wistful pathos in them that Ronald had seen last night, rest on the modern maid, appraising the choice of his heir, the mother of the 'line' that was to be—the 'line' that had begun with State service, not money.

And then, in his mental vision, Ronald saw the old man's eyes turn to him, and he met them.

The boy, battling with the fresh wind off the hill, a wind laden with the honey scent of the sun-warmed heather, with the acrid whiffs of distant peat-smoke, felt hot and ashamed. He measured a distant hill with his eye, and made for it.

Two hours later he was descending the other side of the hill; leaping from one side of a burn-chasm to the other, as foothold offered; holding on to a boulder and swinging himself round it; sliding down little quarries of loose stones; and, having breakfasted early and missed lunch, feeling uncommonly hungry and thirsty, and conscious that not only was he somewhat vague as to his whereabouts, but that he must be at least fifteen miles from home. 'Home'—he thought of it as that, now.

He had taken his bearings from the hill-top, and now, reaching the foot, set off at a brisk pace along a lonely track through a valley. It seemed little frequented, for the heather grew in patches over the path. And then the valley widened out, and in the distance he saw farms and bits of the hillsides under cultivation; and then, again, he was in the cool, aromatic shade of a pine-wood. Gradually the road, soft with inches deep of pine-needles, grew less and less wild; the rough undergrowth on either side gave way to ferns, and larches and rowans and young oaks mingled with the pines. A gate across the road made him pause.

'Looks like private property,' he thought to himself. But hunger was insistent; he could not retrace his steps, knowing that no prospect of food lay behind him. This way, at any rate, might lead to civilisation and an inn. His heart leapt out to meet an inn, or even a farm or a cottage where he could beg.

The road showed traces of wheels—the edges had been trimmed—rhododendrons were massed. In the distance rose the frenzied barking of dogs—the clamour of the kennels before the Twelfth.

'Awkward, this,' he said. 'It looks as if I

were getting near a house. Perhaps I can skirt round it. It must be behind those trees.'

It was. A sudden turn brought him right on to it—a soft green lawn, sloping to his feet from the edge of a veranda that half-encircled a long, low house, white-harled and home-like. Deck-chairs and tables stood about on the veranda, and overflowed on to the upper part of the lawn; and in the centre of the lawn, facing him, stood a lady. It was too late to escape—he must explain and apologise. The lady, somewhat to his surprise, came quickly towards him. He doffed his cap, and quickened his pace to meet her, words of apology on his lips. They were never spoken. The lady, almost running as they met each other, threw her arms round him, drew his head down, and kissed him on the forehead.

'My boy,' she cried, 'you have come! Thank God!'

III.

Ronald was absolutely speechless. He liked it awfully—but was she mad? She released him, and, putting a hand on each shoulder, gazed earnestly up into his eyes. No, she wasn't mad. She had a weak, pretty, appealing face; her uncovered hair, just turning gray, was elaborate in its curls and coils, and pendent ear-rings flashed from the lobes of her little ears. To Ronald's youthful judgment she was no longer young; but she might have been anywhere between thirty and forty. She seemed emotional—at least, it wasn't customary.

'I knew you would come!' she said in a voice tense with feeling. 'I knew you would not fail me—and now all will be well, and our fondest hopes realised! You are very like your father,' she added.

He felt he must explain, and yet it would be awkward for her, after the welcome she had given him. Still, it had to be done. How to begin? He plunged. 'I'm afraid I—this intrusion is entirely my fault.'

'"Intrusion,"' she murmured reproachfully.

Great Scott, she was going to do it again! He backed. 'I—please forgive me—as I say, this—this——'

'Your father's voice, too!' she told him in enraptured accents.

'As I say, it is entirely my fault that——'

'I know, dear. You have been long, but I forgive you. You kept away—it was cruel, and yet quite natural. You did not want to see me.'

'I assure you nothing was farther from my intention——'

'No, indeed! How could you guess a woman's feelings? How could you know that your love was the one thing needful to complete my happiness, and that I prayed nightly that your heart would soften to me?'

'How, indeed?' muttered Ronald, mopping his forehead. His frenzied eyes, rolling round for an inspiration how to escape, spied a man-servant in the distance, carrying a tea-tray. Here, at any rate, was another man—and tea. Ronald became suddenly aware that, woman or no woman, he was ravenous. The man put the tray down on a table on the veranda, and began setting out the tea-cups.

'It is so wonderful to see you!' the lady continued. 'And now that you have come, I forgive you—indeed, I forgive you all your cruel neglect of poor little me! But, ah!—you naughty boy—it isn't *me* you have come to see; poor little me, so ready to love you!'

'Deuced ready!' muttered Ronald inwardly. He hated the type of woman who said 'poor little me.' Besides, she was out of fashion. He recognised this type—she was the 'appealingly feminine,' who, last century or thereabouts, wanted little here below, and got it by soft, feline methods. At the present moment she was mad, poor gentlewoman! Mad as a hatter. Most awkward for him. Perhaps this place was a private asylum. Could he get near the veranda, and manage to say a word to the man? He looked round, only to see the man step through the window and vanish into the darkness of the room beyond. But the tea remained.

'You must not be shy with me,' the lady said, smiling. 'I am your friend, remember.'

'You are very good,' said Ronald. He felt dizzy, partly from hunger, partly from mortal fear.

The lady took his unresisting arm. 'Now let us come to tea,' she said, suddenly assuming the air of an everyday hostess. 'I am sure you must be famished after your walk.'

He was. He felt he ought to humour her. He believed it was dangerous to cross such people. And there would be scones and substantial home-made cakes—there always were in the country.

They stepped out of the sunshine into the cool shade of the veranda. Yes, there were plates piled with scones, sandwiches, all sorts of big, bulgy, home-made cakes, hot and spicy. She might love him as much as she liked, if only she would do the love-making and let him feed. He sat down contentedly. She poured out his tea and handed it to him, and the big, shallow silver cream-jug, full of frothy cream. She was certainly a charming woman. He hardly listened to her as he cut open a scone and helped himself to butter and jam. But he was not destined to eat it—not immediately.

'Ah!' His hostess, her cup half-way to her smiling lips, paused and gazed at something over his head. He looked round to see what it was, and sprang to his feet.

Framed within the open window stood a girl, tall, slender, dressed in white, her hands full of

roses. She was looking at Ronald, her cheeks a little flushed, her lips a little parted, her great eyes wide with wonder. She was the loveliest vision he had ever imagined.

IV.

'Here is Hilda!' the lady breathed softly, a note of triumph in her voice. 'She expects you.—Hilda, he has come—at last!'

Was she a vision? Was it all a dream? She came down slowly from the step of the open window, and walked towards him, her eyes on his face. Would she also—oh, if only in a dream? The blood coursed through his veins. But she did not. Instead, she halted irresolutely, and the roses fell from her hands and lay at their feet.

Ronald went down on one knee and gathered them up, and gave them to her. She took them from him without speaking, but as he rose their eyes met, and the expression in them brought Ronald quickly to himself. Whoever it might be that the emotional lady took him for, this exquisite girl did not share the madness: she knew him as an impostor.

'I—I was trying to explain—I came——' he began.

She made no reply, but her eyes left his, and rested momentarily on the buttered scone on his plate. Then she looked at him again. It was a distinctly awkward moment. It was broken by the lady, whom they had both forgotten. She gave a soft, indulgent laugh.

'Can't you speak to one another, you two young things?' she said. 'He is very like his father, isn't he, darling?'

'No; I see no likeness,' answered the girl.

'I would give a good deal to know who I am,' Ronald told himself.

'Your tea is growing cold,' Hilda added, looking at him gravely.

Well, she evidently did not mean to betray him. Why not? Ronald felt a sudden sense of wrong. He became exasperated. He told himself he was being put in a false position—perhaps he had put himself into it; but, anyway, it wasn't he who had kissed the elder lady; and after that he couldn't very well—— And the girl evidently knew that the woman—her mother or whoever she was—was under a delusion; and if she knew, why didn't she say something? And she was lovely! He looked at her with reproach in his honest young eyes, and, striding to the other side of the table, held back a chair for her. She might see he could say nothing—that he was tongue-tied; and really she might credit him with——

Suddenly her gravity vanished. She smiled at him radiantly, slipped round behind her mother and the tea-cups, and sank into the chair he was holding.

(*Continued on page 297.*)

A WALK THROUGH KABUL.

By Sirdar Ikbal Ali Shah, F.R.G.S., M.R.A.S.

I.

IT has been said by some observant philosopher, and quite truly, that in order to know a city or a country it is not only necessary to see the palaces, 'Durbars,' Government offices, and 'show-places'; one must also consider the streets, by-roads, and lanes, the many centres of popular recreation, where the daily life of the people is chiefly seen. Afghanistan, unlike some other Eastern lands, is not reserved or proud about its mode of life, its silent forces of the soul; its inhabitants are a free people, with a practical bent of mind, and can be observed admirably in the course of an evening stroll through the highways and byways of the capital. To a pure Westerner Afghanistan appeals not only by reason of its geographical conditions—the mentality of its people can very easily be compared with Western ways of thought.

Certain superficial differences from more familiar scenes would at once be noticed by a visitor from the West. In the bazaars of India, for instance, costumes vary considerably, and one wayfarer may not resemble another in the least; but in Afghanistan similarity of dress is a very marked feature. Showy colours, bright tints, are, as a rule, absent, although between the dresses of persons of different social standing a definite distinction is perceptible. Here those who know the country can draw a comparison between the ancient and the modern ways; the old Afghanistan and the new have many points of variance. In older times one was struck by the plainness of the clothes and the outstanding brutal aspect of the people; to-day these crudities have vanished, and in the modern Afghan we find a man of the world who understands the significance of progress and is wide awake to the developments of our age. We notice that modern methods of doing business are adopted; telegraphic communication and other useful applications of science are frequently met with; and, in general, the desire to enter the arena of competitive nations in the race for greatness is characteristic of up-to-date Afghan ideas.

II.

Kabul, the chief city of Afghanistan, is an interesting and busy centre, where the continual *va-et-vient* of the people gives many excellent opportunities for philosophic observation, especi-

ally at evening, when the city shows the stranger its best aspect. Its roads are so direct that no guide is needed, and at that time of the day they are crowded; offices are closing, business is over, the town-folk are moving homeward, and the country-people are beginning to return to their villages. Others, with more leisure, are simply promenading, 'taking the air,' seeing what is to be seen. Let us mingle with the restless throng, and saunter first past the Ark Palace. This was built during the reign of Amir Abdar Rahman, and is fashioned after the style of the Palace of the Moguls of India. Near by stands the palace Dilkusha, in a Western mode of architecture, with French windows and glass doors. Adjoining this is the wireless-station—which we may mention without comment, so all-embracing is the spread of science!—and opposite this building is the Clock Tower.

Continuing in the same direction, in a few minutes we reach a straight road leading to Deh Afghani, the older part of the town; another principal road on the left would bring the wanderer to the Foreign Office, past the army stores and the police-station. At Deh Afghani modernity is left behind; progress is forgotten. It is Old Kabul, a different atmosphere, an entirely different scene—one which visitors from the West never tire of watching, particularly in the evening, when there is an indescribable fascination in the light and shade, the motley, moving throngs, the murmurous sound of a thousand voices. Through the narrow lanes passes a constantly changing stream of traffic; but it is not the traffic of the West. Ponies, horses, mules, donkeys, dogs, and men push and press and jostle one another in the constricted byways, and the spirit of the East broods over it all.

The shops, though small, have plentiful displays of various kinds of goods. One does not notice the Bokhara carpets, or the furs; but dried fruits, vegetables, and tea are to be found in abundance. Toys are a special feature of this busy quarter, for in Kabul the children are well looked after, and their demands are excellently catered for; and as children some of us would have rejoiced in the delightful, highly coloured miniature camels, horses, and elephants which form a large proportion of the toy-merchant's amusing stock. Among the people strolling hither and thither may be seen many veiled ladies, making occasional purchases.

III.

When we turn down the road which leads to the Foreign Office quite other interests present themselves; we step back into modern manners immediately. The scene is still busy, in a totally different way. The Habibish College—which is now a military college—has just closed, and its students crowd the road, strolling and chatting. They are smart-looking, handsome youngsters, uniformed in khaki, and range from nine to eighteen years of age. Among the boys the nine-year-old son of the Amir may be seen, riding a small pony, and in no way distinguishable from the others. Under the democratic new régime the son of the ruler has to rough it just like other boys, and has to salute his officers.

This military college is an important centre of Afghan education. Old and young alike take an intense interest in it, and here is an admirable spot to pause and observe contrasts. Along comes an Afghan of the old school, galloping his camel, his hair falling over his shoulders, his red-and-blue uniform glowing in the evening light; not far from him walks a modern Afghan soldier, trim and clean-shaven, in smart green uniform and wearing an astrakhan cap. Near him, again, comes a would-be-soldier cousin riding a bicycle; he has a brownish suit, and is smoking a cigarette. If these men of the modern mode did not wear a distinctive cap or costume, it would be difficult to tell them from Englishmen or Frenchmen. Other boys in addition to the military students are prominent, wearing red caps on which gold lace is tacked. They are the orphans of those killed in the war of 1919, and the Amir has issued an order to the effect that henceforth the Afghan Government will be responsible for their support and education. And so the lively hour goes on; while, threading the crowd, some country-folk with long beards, very respectably dressed, are hastening homeward on their slim mules.

At the Foreign Office we may note a red flag flying, the sign of an official visit from the Amir. This is the only Government office at Kabul in which work is done behind closed doors. By a glimpse of the interior, obtained through chinks in the main gate, it can be seen that the various offices and departments are built round a garden, in the centre of which stands the mausoleum of the late Amir Abdar Rahman Khan; a small mosque also rises in one corner of it.

Resuming our walk, a few more minutes will find us on the bank of the Kabul River. This is sure to be a busy spot. Rustics, still lingering, loath to leave the charms of the town, are occupied in buying articles to take back with them, and are also consuming tea by the gallon. They are very fond of tea, though the beverage is not precisely that which we favour in Europe. The liquid is boiled in big copper *samovars*, and in the tea-shop business is flourishing; customers enter by the dozen, and cup after cup is sold and drunk at once. The 'hubble-bubbles' are making pleasant, friendly noises, and talk flows merrily. It is a social, attractive scene, well worthy of an artist's palette.

IV.

On the left bank rise the silhouettes of innumerable mosques, and it is the hour of

evening prayer. Here stands the mausoleum of the famous Tamerlane, and farther on—a contrast indeed!—the Post-Office, a building in the modern style; then comes the Kabul bridge, always picturesque with passing crowds.

Crossing the river to reach the new Kabul, the visitor will note that along the farther bank runs the wall of a spacious orchard, within which stands a double-storeyed building floating the flag of the Bolshevists; this is the Russian Embassy.

About a hundred yards more, and we shall arrive at a building which seems more congruous with the Midlands of England than with the heart of Afghanistan—a huge factory about three-quarters of a mile in length, the great workshop of Kabul, and one of the most notable in the country. It is erected in the European fashion, and the motive-power for all machinery is electricity, current being transmitted from the power-station at Hablul Sarah, about ten miles off. Its range of products is remarkable: guns, rifles, howitzers, gunpowder, machine-guns, acid, and the less war-like commodities of soap and cloth are manufactured here. The quality of the cloth produced is possibly superior to that of any other factory in Asia and Afghanistan, for the natural resources of the district are very great, and it is fortunately situated.

It grows late, and we must return, crossing the river again to the main road. On one side of us lies old-fashioned Kabul, with its narrow thoroughfares and its peeps into an ancient civilisation; on the other side is the new Kabul. The modern note is everywhere; even cycle and motor-cycle shops are there, not only for the sale of goods, but for repair as well.

In the covered bazaar, across the river, dark and strange, you may see camels and loaded donkeys passing through, and Hindu shopkeepers engaged in petty matters of business. The present Amir has cancelled the order which compelled the non-Moslem section of the population to wear yellow turbans. Hindus, as a rule, wear red turbans, and are very keen on the observance of their religion and traditions. A significant fact in present-day life in the city of Kabul is that complete freedom is permitted to all creeds, all branches of religious observance.

Not far from here are situated the poorer quarters; smiths and ironmongers appear to predominate, but we shall see some men dressed in a black uniform—these are sweeps and labourers. By now we are practically at the end of the town, where the roads go to Jelalabad and Peshawar. It is worth while stopping to notice the Chaman Hazuri, or Audience Garden, which contains a triumph of Afghan gardening art. Poplar-trees and French flowers are artistically arranged, and the road leading to it is well illuminated by electric lamps carried on posts.

Here stands Kabul's wireless-station, keeping her abreast of the world moment by moment. Passing this, we come to the War Office, where a red motor-car at the entrance signifies that the Governor is about to pay a visit. The road leading to it, lighted on both sides by electricity, has in the centre a memorial to those who fell during the Anglo-Afghan War of 1919. At the gate of the arch is a sentry of the Royal Horse Guards, tall and stately in his gray-and-red uniform. Another hundred yards or so, and we reach the police-station; we have made the circuit of Kabul, and our tour is ended.

MAN'S WORK.

By Alan Sullivan,
Author of *The Passing of Oulibut*, *Blantyre-Alien*, *The Inner Door*, &c.

CHAPTER XI.

I.

THE grind of work closed in, and Shanklin mustered all his powers to face the days yet to come. It was difficult to tell whether the knowledge that Claudia still loved him was a help or not. His own worship remained unshaken, but there was introduced a dull sense of bewilderment that his own ultimate success would spell disaster to Claudia's fortunes. She would never suffer; he would see to that. It might be on the knees of the gods that sometime she would come to him. He could only work—and wait.

And if Shanklin was enveloped in a cloud of depression, no less was Claudia, from whose eyes the mist of error had been so swiftly cleared. All that was in her of loyalty and honour rose in protest. Sitwell had staged his drama, but the dénouement was not what he anticipated. He did not perceive that machinations, however astute, cannot warp those emotions which are both sincere and profound. He was attempting to remodel things to his own desire, ignorant of depths he aspired to probe, and forces which he only stimulated. He had credited neither Claudia nor the man she loved with the composure they displayed. It amused but yet aggravated, and in a queer way puzzled him.

Had he any doubt as to what moved in his wife's mind, he was disillusioned that very evening. They left Edith Winter at her hotel, where the girl sent him an inscrutable glance, and, reaching home, he flung himself in a chair

with a grunt of relief. Then Claudia turned on him.

'I want to tell you something, Bertie.'

'This seems a good opportunity for confidences,' he said coolly.

'What I am going to say will make a difference to you all your life.'

'I'm consumed with curiosity. Please go on.'

'It's just that I despise you more than I thought it possible to despise any one. You're not a man—you're a snake. You have no honour, no pride.'

'That's a pretty stiff sentence. Anything more?'

She regarded him with hostile eyes. 'Yes—more than I'm able to put into words. You've killed whatever I might have felt for you, except contempt.'

'That's enough,' he said warningly. 'Shanklin asked for it, and he's got it—but not all. He started it with your father and myself.'

Claudia caught her breath, and the truth that had stirred so restlessly in her heart burst forth at last. 'He was right, and you know it.'

'So your father was——'

'Listen,' she said hotly. 'My father never blamed Mr Shanklin as you did. That's done with. But now you'll have three people to fight—Jack Shanklin and his partner and myself. From what you have told me I can guess what you haven't. That's what you will remember—always. If I can defeat you, I will. While you plot, I'll be doing the same thing; and don't forget that I know you better than any one else.' She broke off, struggling with emotion.

'And Shanklin and his lady-love?' he put in, as though he had not heard a word.

Her lip curled with scorn. 'Is that your only defence? If so, it's no use.'

Sitwell became aware that she was looking at him as though he were a long way off. He got up and came towards her. 'Don't be a fool, Claudia, and lose your temper. Shanklin happened to hold that first option. It would have been the same if any other man had held it; business is business. If he falls down, I take it up—and become Martin's partner. Wouldn't you like that, for both our sakes?'

'Never,' she said bitterly.

So it was that Sitwell ranged against himself all the factors of probity and courage. Spencer Martin had cast over him a spell, the glamour of which had blinded many a man. To be rich, to be powerful, to wield authority over affairs, and to be thus recognised—he had put this in the balance against the regard of woman and the respect of man. The root of it was that what he wanted he wanted for himself, and his soul had no depths in which to harbour other emotions.

And behind all this there was one thing that gnawed in Sitwell's brain like an unsleeping worm. He had committed himself to Spencer Martin in such a manner that, make or break, his future lay in the big man's hands. At the time the terms had seemed arduous, but he reckoned them none too arduous for the prize at stake. But now, confronted with Claudia's enmity as well as by the contempt of Shanklin and his partner, Sitwell began to question the efficacy of the methods he had so coolly determined to adopt. This doubt began to assail him in New York; it harassed him on the journey west; it grew more formidable when he told Shanklin that business was business, and hated him the more because he was honest. It was this very honesty that made Sitwell suspicious of his own weapons. It was a stand-up fight with something he didn't understand. Therein lay the growing canker of his soul. He had begun to dream dreams and see visions that terrified him. What if Shanklin won out?

II.

Before long things began to happen on Shanklin's option. Men came for a day or two to work, and dropped out with pointless excuses, or none at all. The daily footage dwindled. There was no obvious reason for any of the countless minor troubles, but Harrison and his partner were under no misapprehension. Finally Denison, the drill-runner, came into the tiny office one night with a letter he had just received from Texas. He put it down in front of the contractor. It was from the Empire Oil Company of Fort Worth, and offered Denison a job at a rate nearly double what Harrison paid. Expenses would be found. Harrison read the letter, whistled softly, pushed it across to Shanklin, and turned to his foreman.

'Know these people?'

Denison shook his head. 'But they seem to know me.'

The contractor glanced at his partner. 'Tell him, Jack.'

For a quarter of an hour there was silence, save for Shanklin's voice putting the story dispassionately. Denison's dark eyes flashed once or twice, but he did not interrupt. He heard of Edith Winter's investment, and how it came about. He surveyed Harrison's grim face, and reflected that this was the father of the girl he still wanted to marry. He came of fighting stock, and his blood warmed. Here seemed the makings of a fight good enough for any man. The Texas offer, though it emanated from Spencer Martin, began to grow less attractive. Then Shanklin looked straight in his eyes.

'How about it, Bill? It's your say.'

Denison spoke briefly, but with a picturesque freedom. The gist of it was that he would be damned if he left them! Whether it was a dry well or a gusher, he would stick. He had no money to put in, but he would work the skin

off his hands to beat a pair of crooks who—and then his descriptive powers failed altogether, and he stepped outside to ease the burden of his soul. Presently he put his head in. 'I can fix that fellow so he won't give any one any trouble.'

On the hasty assurance that this was not the kind of help needed, he retired. Shanklin glanced at the other man. 'What about the rest of 'em?'

'I've been thinking. Burbeck, the other runner, I'm not sure about. Only one thing to do. You and I take alternate shifts—no more holidays—but hang on to the job. We'll have our hands full.'

On the 10th of July the whole hole was down a thousand feet, still in shale. On the night of the 11th Burbeck reported to Harrison, who was on duty, that he had lost the bit. Harrison cursed and ran to the derrick.

To those who follow the oil game no explanation is necessary; but let those who know it not consider a ring of gigantic steel teeth at the bottom of a thousand-foot hole, ten inches in diameter, blind, black, and unapproachable. The losing of a bit has dissipated courage, wrecked fortunes, broken hearts. It has snatched success from waiting hands and robbed the world of riches. It is as though the metallic finger of science were chopped off at the joint, leaving a helpless stump.

Harrison and the rest of them sweated for a week. The danger—and he knew it well—was that in rescuing the bit they might lose the hole. Steel casing will stand so much handling, and no more. Time and again Denison's tongs grappled with the thing, and lifted, only to have it break away and plunge downwards with a shattering force. On the seventh day the tongs took hold, kept hold, and the thing was drawn up gingerly, foot by foot, till its gray length swung clear. The hole, at least, was saved. Came then the necessity of punching through a piece of the old bit, where it lay embedded, with the new one. For this Harrison used special cutters, costly things of great hardness and high temper. It took three precious days. Drilling recommenced on the 21st of July. There were forty-one days to go, and still a thousand feet to sink.

It was no surprise to them that Burbeck had disappeared an hour after reporting trouble. They only wondered how much he had been paid. But the problem was to get a substitute for Burbeck. Harrison solved it.

'You take it, Jack,' he commanded. 'You know enough already, and you can call me any time. I'm wanted for too many things. Keep plugging till you hear something that sounds wrong; then quit, and shout for me or Denison. That's all there is to drilling.'

Shanklin took it, and liked it. There was a definite romance in feeling that great blind mechanism throbbing far beneath as it bored steadily through the recesses of the earth. He achieved something of the philosophy of the true mechanic who interprets his machinery in terms of life and feels it respond to his slightest touch. He did not spare himself, for the time was getting appallingly short.

In the middle of the month a letter had come from Edith Winter:

'You'll be wondering, perhaps—or I hope you will—what has happened to me. Nothing; but I've made up my mind not to bother you by being in the way. I think the best thing for me to do is to stay here in Catalina, and wish you—and all of us—luck. Of course, if there is the least thing I can do, you will let me know. I hope everything is going all right. Tell me if I can help—but I feel that a woman hanging about is apt to be a nuisance. Best wishes to Mr Harrison.—Yours, E. W.

'*P.S.*—My love to Mr Sitwell.'

Harrison grinned when he read it. 'Good stuff—only there's something we've got to tell her.'

'What?'

'Her twenty thousand isn't going to be enough to see us through. It might, but for Burbeck. He cost us about four thousand. I've just been figuring. If nothing else happens—and it will—we'll need another four thousand. Can you get it?'

Shanklin wiped his greasy fingers on a piece of waste, and put the waste in his pocket.

Harrison nodded approvingly. 'You wouldn't have done that three months ago. How about it?'

'I'll go into the city to-morrow, if you'll take over.'

(*Continued on page 298.*)

ROSES OF SURISTAN.

VAIN, vain love's creeper wide outspread,
The calamata, blows,
And flushed celestial rosy red
'Gainst the white marble glows.
And vain the jasmine stars the gloom
O'er the low archway's span;
More sweet, more sweet thy rich perfume—
Roses of Suristan.

Hark how the bulbul's liquid strain
In melody divine
Floats charged with subtle sweet and pain
And longing love—like mine.
Sad in the mystic glimmering night,
Exiled by fatal ban,
He plains as I his lost delight—
Roses of Suristan.

Fair, fair thy blossoms interweave,
Thy velvet petals fold
In crimsoned glow each dewy eve
As in fond days of old;
And still though far wide waters part
And sped the magian,
Thy perfumed sweet blooms in my heart—
Roses of Suristan.

MARY M. CURCHOD.
ALGIERS.

OUR RIVER.

By SHIKARI.

I.

OUR river can only be mentioned in the day of small things. It is a stream flowing from the hill moorlands through a fair valley of little farms, to join a larger river on its journey to the sea.

It is an 'open' stream, so that all may fish in it. They all do, and their methods are not always orthodox or even legal. Therefore our trout, especially in a dry season and low water, are much exposed to the crafts and assaults of the wicked.

Not for them the sheltered ease of those fine fellows one sees suspended motionless in the crystal waters of an English chalk-stream. Those long, green corridors with walls of waving weed, paved ten feet below with silver sand, are their hunting-grounds, in that broad reach just opposite the keeper's cottage. There they wait till the nymphæ come swarming down into their waiting jaws. Sometimes they will even slowly rise to the fluttering dun on the surface. Sometimes not. Their keeper knows them by name. He and the underkeepers prevent even the shadow of the unrighteous from falling on them.

To this sort of stream you return the mere pounder as a thing of nought. In our stream the pounder is an event. His capture marks a date like Waterloo, or the Ballysloughguttery Fair Day.

Our keepers are two slinking rascals appointed by the Local Fishery Board to watch the water. They are—not unjustly—credited with being the chief poachers in the district, and the only time I ever saw them at work was one summer evening when fishing a pool; one of them crept up like an unclean shadow, greeted me with an evil grin, while he hurled a night line with a dead minnow on it into the depths with the statement, 'They are gran' things entirely for catching eels!'

In other words in fact, our river is in Ireland. But we have not only to compete with our poachers and poisoners, our limers and netters, and, worse, with our keepers; we have also to suffer from three principal foes that we have (more or less) always with us. These are (1) flax water; (2) the potwalloper; (3) the duck.

II.

The flax water is, of course, that universal, horrible, and quite preventable evil under which we of Ulster have been, up to date, content to sit and suffer. We grow flax. We rot it in a hole in the ground filled with water, called a dam. Some of us take the small degree of trouble necessary to pass this foul and poisonous flax water through a slight filtration system of drains and ditches, to allow it to emerge harmless into the river. Others do not, and we will leave it at that. Should the river be low when this poisonous brew is poured in, many trout may be poisoned. Sometimes they are. Should the river be high no great harm is done—not, of course, the fault of the poisoners. Still, Providence does temper the wind a bit to the shorn lamb, for with us it is almost always raining.

After the flax water, perhaps our greatest trial is the potwalloper. This is the local angler whose object is the 'pot.' All is fish that comes to his net. The smallest parr can hope for no mercy from him. It counts for the pot, and therefore goes into the bag. Armed with a large rod, severe tackle, and three or four staring objects sold as 'flies' by the local hardware merchant, our old friend the potwalloper moves down-stream like a sort of pestilence. His countenance is full of seriousness; he sloshes the water heavily, with slow regularity, without haste and without rest, but with that dour, solid perseverance which has made us the great people we are. He takes his pleasure sadly. You hear the heavy swish of the flail, and he moves on you like fate, round the bend where, on a spring morning, you have just started to lay siege to one or two useful trout rising in the stream at the newly hatched dark olive duns.

This nightmare bears down on you, and over you, as likely as not, casting right over your head. Gone are your rising trout like chickens from a swooping hawk. He moves on like a thunder-cloud, or a steam-lorry, or any other misfortune. Presently, however, he is gone, and if you are a man of patience, and one seasoned with adversity, and will sit still for a short space after this calamity, your trout will have once more lined out to stations, and got to work. Now is the time to get busy with the floating dark olive, and send it properly cocked and floating over the nose of that last one who has just risen. There he goes again, but this time it is your dark olive, and from the flash of a broad, golden side in the amber water, and the weighty pull, you feel a 'good one' securely hooked before the potwalloper is even out of sight. After all, the poor old potwalloper is not such a bad sort, even if politeness is not his long suit; he has just as much right to enjoy a spring day by the water-side away from his factory or his work as the best of us. Besides, he has got one excellent quality—as a rule he doesn't reduce the stock much.

Our last and most exasperating enemy is un-

questionably the duck. This brute, I regret to say, swarms most unnecessarily on our river. He gabbles and quacks and bustles about over our best pools and streams just when the rise is on. He is strongly suspected of feeding on trout ova and trout fry. Otherwise, where does he get that fishy flavour?

However remote you think the pool, where you have just got within casting distance of some sizable trout, steadily on the rise, and are about to drop your sedge fly over him, you may take it from me that at the critical moment a couple of these brutes will come puffing and bustling round the corner, stop in midstream to stand up and flap their wings and give a few loud quacks calling the rest to follow. Your fish, of course, has got to ground fifty yards up-stream with the speed of an aeroplane. You may see him to-morrow, or you may not.

No! I don't mind meeting the duck at the right time and place—say the dinner-table, in company with sage and onions, green peas, or what not; but in the river he can only be described as 'the limit.' Once only did I see him get his deserts. Many years ago a small schoolboy was doing all he knew to drop his flies lightly over one or two decent fish rising in the stream. Without warning he was suddenly aware of a horde of these brutes pushing and bustling up-stream into his scene of action, led by a horrible, hysterical, quacking, squattering white drake. The boy could stand a certain amount—in fact, quite a lot—but on such a fishing morning he judged that this exceeded the speed-limit. Providence indicated to him a flat pebble lying at his feet. Some higher power guided the flight of the projectile, which took the white drake neatly on the top of the skull, and converted him from a squalling, quacking lunatic into a 'dem'd, damp, unpleasant body' in one single instant of time. Dirty work! Of course! Very! At least so said an old farmer about half a mile down-stream to the schoolboy who was fishing there. The schoolboy had judged it advisable to make a slight strategic detour down-stream from the scene of the outrage, and was, therefore, about opposite the old gentleman when the accusing corpse of a white drake floated down between them. 'Them d—d children has been cloddin' the ducks again! I'll learn them to clod ducks when I get back; d'ye mind me now? I'll learn them!' The schoolboy agreed that this was the right spirit, and the children should undoubtedly be taught a lesson.

III.

The standing wonder about our river is that, considering all these and other enemies, any trout remain. Yet, undoubtedly, they do remain—quite a lot of them. Horrible things happen in long droughts. Our best pools are left tenantless, or nearly so.

But April comes round again, and on the first good day, if you have the luck to be out by the side of the river, even if there has been an early hoar-frost and a mist melting off the grass in the morning sunlight, you will see a few midges dancing under the willows over the amber-brown water; then a tiny creature—which is not a midge—fluttering and drifting across the long pool under the planting, towards the sun. As likely as not he is picked up by a waiting chaffinch. But he has done it! He is the first dark olive. Already a rise or two at the head of the pool, a boil in the stream, and the flashing of a golden side through the amber water show that the rise has begun. The olives come down in twos and threes and single spies, but, however many, there is a trout ready for each, and the pool, which seemed tenantless, and which you suspected was dynamited or poisoned with flax last season, is fairly boiling with rising fish; not all very large, perhaps. In fact, most are pretty small; but there are always one or two useful ones if you look for them. Where did they all come from? Well, that is what we all want to know. Do they breed in the mountain burns and continually replenish us? Or do they come up from the larger waters of the big rivers and the lough below? Or do they do both? We don't know. Good trout are certainly seen coming up over the weirs with the few salmon that come up in autumn. But now is the time to get busy with the floating dark olive while the rise lasts. We haven't time to think about these things, but only to be thankful that somehow or other they do happen. Over on the far bank you see a green plant half in the water among the rushes. Some of us call its gold cup May-flower. Some say it is the kingcup or marsh mallow. Who am I to decide? Anyhow, there it is, overhanging the clear, brown water under the red clay-bank.

Mark you, my scholar, the trout taking olives under that will be a right lusty one!

Yes! there he shows his nose, sucking down a fluttering olive. Can you do it? Well, one can only try. By a lucky fluke the olive dun drops like a snowflake, and comes floating over him, cocked—to deceive the very elect. He has it—scarcely breaking the surface; but his plunge for his holt bends the little split cane like a whip, and you pray for the next few minutes that nothing may come undone before he is safe in the net. But this is our lucky day. This is the kind of day with spring in the air and hawthorn-buds on the tree, and the yellow kingcups reflected in the brimming brown water; the trout in an oncoming mood, and well disposed to take your floating dun on trust. This is the kind of day that compensates the wayfaring man for all he has suffered from flax water, poisoners, poachers, and ducks. Or those summer evenings, long after sunset, when the potwallopers have 'quet,' and the clear

primrose sky of sunset is mirrored in the still, dark waters of the weir, broken only by the rings of the trout after the dancing sedge flies.

Those are the times one remembered in an Indian hot weather in some stony frontier station, like the mouth of the pit, or on the war-path across the Afghan frontier, or even in the winter slush of the Flanders trenches. One felt like Kim's Lama, and wondered should one ever see one's river again. I feel certain; Bill thinks so too. Bill was first introduced to his river as a small, fat boy. But Bill was born to it, and soon defeated his instructors. The 'dry fly' was no mystery to him. When he and I discovered a monstrous trout rising at midges up the far bank of a tributary stream under an oak-tree, almost out of distance, we each had a go. Each managed to land a minute black gnat in front of him. Each got a rise out of him. Alas! he touched mine, but not quite enough to adhere, and with a monstrous roll he was gone, leaving me lamenting. Not so the fat and sturdy Bill. 'Never mind, dad,' he said. 'He can say that he has defeated the two most craftiest fishermen on the river!'

But Bill is not a fat little boy now. He commands a field company of sappers somewhere on the Euphrates. He has put in a bit of fighting with our old friends the Mahsuds, has Bill, and even with that has found time to gather some notable heads from the nullahs of Kashmir. He has also caught mighty Euphrates salmon, but does not think much of them. But I know Bill. What he really wants is a day on his river. And what I really want is to be there to see him having it.

BEHIND THE LINES.

By Albert Kinross.

PART I.

WE had been talking about the war, and had found it rather a mild and soothing topic after the unrests and the discontents of peace. For, what with strikes and lock-outs and the threat of both, and Ireland, Russia, and India, and France and Germany and Turkey, all simmering or in active eruption, we seemed to be ever so much more unsettled than we had been, and there looked to be no end to it. And so we had turned back for a moment to dwell out there again, amid those four strained years that are so difficult of obliteration.

It was my friend Vignolles who began it.

'Do you know,' he asked, 'there are people who almost go down on their knees and beg you to tell them something hair-raising? It's the civilians, of course, who haven't been out. They want to hear stories that'll make their flesh creep. They almost implore you to lie to them, and I've no doubt a good many fellows oblige. But modern war, what is it? Mechanics! A man ten miles away, who's never seen you and doesn't know you, lets off a gun, and it blows you into small pieces. That's all the fun he gets out of it, and most times he doesn't know whether he's hit anybody. Or you squirm on your belly in the mud, and a chap up in the air drops bombs on you; and you're stiff with funk, and he's not specially enjoying it. He dumps down his load and goes home again. Or, once in a blue moon, you may be able to empty your revolver into a man or two who're trying to bayonet you. Nobody's very sane in those moments, and I grant it's exciting. But you finish with it, and it evaporates. It's a kind of a debauch. You were drunken and glorious, and now you're sober.'

'What about the generals?' I put in here. 'They get a good deal of sustained excitement. Foch must have had months of it, and so must Ludendorff.'

'One man in a million; that's not much to go round. But if you want drama—true drama,' he went on placidly—'sustained and covering months and weeks, it's among the men behind the lines that you must look for it; among the staff people, the supply people, the Intelligence people. They've got the time and the opportunity. They carry on more or less like people do at home. They go to their office in the morning, and leave again at sunset. They've the time for drama, for all the excitements that the fighting soldier has to do without.'

I remember the contentment of that afternoon. Vignolles was leaving England in a day or two. He was going back to the hot and steamy place, down in the Malays, where, before the war, he had grown rubber, and thought to stay for many a long year. So, more or less, it was a day of parting, and we two had decided to spend it outdoors, amid the country-side that Vignolles loved so well, but had never made his own.

We had caught an early train that took us to Oxted Junction, and then we had tramped from Surrey over the Kentish border, eating our sandwiches in the open, and anchoring at last on a high spot, green and lonely and pied with flowers—it may have been in somebody's park or just outside. We lay stretched in the sun till the rabbits grew used to us, till the cock-pheasants strutted by and a cuckoo struck his notes on a branch above our heads. Far away in the valley ran a thin ribbon of water, and

beyond it the blue dimness of the hills. It was a perfect hour, a perfect landscape; the freshness and surprise of spring were not yet over. Nor was I astonished when Vignolles, starting up and looking round, exclaimed, 'All said and done, England's about the best place in the world!'

'Then why don't you stop here?' I asked.

'No room for me here. There never was.' And then, explaining himself, 'It's all right if you've money or get in with the people who'll push you if you do as you're told; or you may be an unscrupulous rascal till you're forty, and spend the rest of your life covering it up. But people like me have to get out of it—too much of a crowd. Still, it's a fine country—the very best. Ridiculous having that war and cutting down half the trees. Look at them—naked, numbered, and ready to be dragged away.'

Over the near fence were a good many trunks that had lately been cut down and trimmed for the saw-mills. Still, there were plenty left that hadn't been touched.

'I've always thought the German a damned fool,' my friend resumed. 'If he'd had any sense he'd have squared France; given her back Alsace-Lorraine, shaken hands with her, and won her confidence. Then he could have walked into Russia with nobody to disturb him; helped himself to chunks of it—as much as he wanted. All the Baltic part was half German already, and it had actually been German. He could have begun on that. Worth six Alsace-Lorraines. And then I don't know but that, if he'd wanted colonies in the tropics, there would have been anything very serious to stop him collaring a slice of South America. There'd have been the Monroe Doctrine, and little else, if he'd played his cards well. He'd friends everywhere. He'd friends with us of a sort—chaps who were out to help him, though I don't suppose that was the way they looked at it. Those fellows behind the lines; I ran into a nest of them. You remember—or didn't I tell you?—I got sent to hospital early in 1915. I was in France then, with a mounted regiment. We were exercising the horses, and something must have happened. I was exercising the horses, and next I remember waking up in hospital and wondering how the deuce I'd got there.

'"You've taken a toss," said the sister, "and now you must keep quiet."

'I knew I hadn't been thrown, and I wondered how it had come about. My head hurt, and the doctors looked into the pupils of my eyes, and felt my skull to see whether there was any fracture. There was a dead blank between going out with the horses and waking up in hospital. Concussion's like that, and I had more than was pleasant. It feels like neuralgia down both sides of your brain, and aches like blazes. Crowe, one of our officers, came in next day and told me what had happened. A long-range gun had dropped a shell among us, and I'd been blown off or thrown. The poor old horse had been more damaged than I. It took me three months to get over it, and then I was only fit for light duty.

'"We're sending you down to the Army Service Corps," said the depot chief where I'd reported, "till you're right again. You'll be in a base, and they won't overwork you." And that's how I got right among the people who live behind the lines.

'The Army Service Corps had always been a bit of a mystery to me before that. I discovered how it dealt primarily with supply and transport; so that you might be a gay young fellow riding along with a string of wagons, or you might be stuck in a grocery-stall for the duration of the war; or you might be out with a division or a brigade, and have to answer for their meals and forage; or you might be in charge of a row of three-ton lorries, and have a car, so as to run round with them; or you might be given the wheeled part of a field-ambulance; or you might be dishing out frozen meat from a cold-storage depot. Very versatile, isn't it? And that's not the half of its versatility, either.

'Down at the base, of course, we weren't particularly heroic, and most of our work was unloading supplies off steamers and stacking 'em and sending 'em up the line by rail. I wasn't wanted for that job. I wasn't wanted much for anything, it seemed; and every morning I went down to the supply depot, reported to the adjutant, and he smiled and said, "You just play about." So off I'd go to the sea-front and have a bathe, and talk to French families on the beach, and try to keep out of mischief till bed-time. It was a fair-sized town, with a good harbour and business going on, and summer visitors who'd come for the sea-bathing, though most of these were refugees and people who'd been driven out from the places overrun by the Germans. I lived at a hotel, full of staff officers, and was in clover, and the tariff was fixed by the army, so it came cheap.

'One morning the adjutant said, "You've got a French name, haven't you? Can you speak French?"

'About as well as English.'

'"I thought so," said he. "Just come along to the colonel."

'He led me into another office, and there I was introduced to the head of the supply depot, a tired man, obviously overworked, perhaps a bit too old for his job, or perhaps gone soft from many years of peace soldiering.

'He asked me a few questions about myself, and seemed satisfied.

'"Major Colgate, who does the local purchase," he said, "has got to undergo an operation. He'll show you the work, and then you can

carry on till he comes back." And with that he returned to his papers, and we two saluted and went out again.

'"You'll see an office marked Local Purchase on one of the quays," said the adjutant; "you'll find Colgate there. It's rather a nice job."

'Major Colgate was expecting me. He was a large, florid man, with a breezy manner, and not much troubled, apparently, by his impending operation or by its cause.

'"All you've got to do," he said, "is to let the office run itself, and sign papers. Corporal Cliffe knows all about things; you leave it to him, and you can't go wrong. And if you're asked for something fresh, there's the interpreter. Audibert'll always find a good man for you, and do the bargaining. I'll take you round to the bank and introduce you. There won't be many cheques to sign, and I'll be out and about again before you can turn round. There's nothing in it really if you're used to big business. And there's a car. You'll have a car."

'We took the car and drove to the bank, and I gave them my signature, and found I had a credit balance of a good many thousand francs. "When this is gone, you put in to the base cashier for more," said Colgate, "and let him have the receipts. But Cliffe'll do all that. You've only got to sign for it."

'Next we went to the fish-market and ordered fish, and to a fruiterer's and ordered fruit, and to a butcher's and ordered veal, and to a wine-merchant's and ordered wine. "It's for the hospitals," he explained; "what I call the retail trade. They send us a list, and we do that first thing every morning. Those oysters we ordered, they're for a general. Mind you give him what he wants. It pays to look after 'em."

'He kept on explaining as we went; and when we got back to the office, "This base feeds and maintains its share of the Expeditionary Force," he ended. "All the things that can't be supplied from home, or that are best dealt with locally, come to us. It's our business to find the stuff. That's why we're called Local Purchase. Simple as ABC. Corporal Cliffe knows all about it. Don't you, Cliffe? Now, I'd best be off. We'll drive to the hospital."

'I went along with him, and on the road he told me what an important fellow he was at home. "A big employer of labour," he said, "but, of course, I joined up. Can't ask other men to join if you funk it yourself, can you?" He laughed at his major's pay. Before the war he was making as many pounds as he was making shillings—or was it pence?—to-day; and he asked me about my own modest affairs, and intimated that if I came to him later on, when things were peaceful, he might be able to find a place for me. I was only a second-lieutenant, and he looked at me condescendingly. I suppose his own rank went with the job, and hadn't much to do with the individual. "So this is the kind of thing that grows in a base," thought I, and I gave him an extra good salute when he departed. I was glad I hadn't got to work with him. I couldn't have stood it for very long.

'I went back to the hotel for lunch after that, and told the car to fetch me at two-thirty.

'There was nothing much to do in the office of an afternoon, and I yawned and signed a few papers. Corporal Cliffe seemed busy with a long letter home; there was a private who entered figures in a book and kept accounts; and Monsieur Audibert, the interpreter, looked in and asked for money. It was he who went round and paid the small bills we owed. "You see, I get a commission," he said; "it is the custom of the country."

'I knew that to be the case, and could offer no objection.

'"The corporal and I divide it," he added genially, when Cliffe produced a cigar-box full of notes and handed some over.

'The private looked on and said nothing.

'No more did I. I knew it was contrary to King's Regulations for anybody below commissioned rank to handle money, and quite rightly—it protects the man and makes the officer responsible. But if the major liked to chance it, that was his look-out. I left about tea-time, and went into the town. Cliffe said I shouldn't be wanted, and if anything special required signing, he'd send it down to my hotel. But it was highly unlikely. I walked back feeling rather pleased at being some use in the world again; and next morning I turned up early, prepared to deal with what the major had called the "retail trade."

'This didn't amount to much, though it gave us a lot of trouble. Sick men have strange fancies, and when their rank is high enough, the hospital does its best for them.

'The really serious business of that office, however, lay in getting fresh vegetables for the troops, bran for the horses, and yeast for the bakeries. We used up quantities of these, and France, just then, had enough and to spare for everybody. They're a nation of market-gardeners, and there were lots of millers with bran, and the yeast came from the distilleries. Every base had its own area, and we were not allowed to poach on each other's preserves. Still, we were given a large slice of country, and having a car, one could get about quite comfortably. And in the office I found that everything was pretty well cut-and-dried, and it would be simple to carry on with the contractors and people Major Colgate had left to us. So that when I'd done with the hospitals and the unexpected things that cropped up now and again, I could take life fairly easy. I enjoyed running round the coast or exploring the country in the car, and it wasn't difficult to find excuses.

After a battle—there was the one at Loos, for instance—the hospitals cried for thousands of oranges. I crossed my whole territory looking for them, paid in cash, and loaded them up where I found them. The dealers rather held me up over that, and made us pay through the nose. But no one questioned me. Our tradition was to trust people, and the main thing was that the stuff should be on hand when it was wanted.

'So there I was, carrying on under the guidance of my little staff, the corporal full of precedent, the interpreter not much occupied, the private keeping the books and looking after the accounts. In that huge supply depot we formed a tiny island, a very peaceful spot. Sometimes I wandered round and marvelled at its industry; saw the ships unloading at the quays; saw the mountains of bully-beef and jam and biscuit that were stacked in the hangars, the cases of tea and bacon, the bags of flour and sugar and salt, the sacks of oats and barley and the bales of hay, and my own bran that arrived here. I'd wander among the fuel and the petrol and the lubricating oils, or into the carefully guarded "cage," where they kept "medical comforts"—stout and ale, champagne and arrowroot, port and brandy, and tinned chicken. Or through the Indian section, with its rice and strange odours. The men who worked among these things led a rather monotonous life, dishing out the same stuff day by day, or loading up trains with it and despatching them, and standing about on those weather-swept quays by the hour. It wasn't heroic, but it was dashed hard work. I can't say that I envied them. But they rather envied me, with my freedom and my car and little office. I still had my comfortable quarters at the hotel, my headaches were gone, and I was fit and hearty. It was pleasant to be of some use again, and everything seemed to be going swimmingly and without much effort.'

THE SEVEN LAMPS OF ADVOCACY.

V.—THE LAMP OF ELOQUENCE.

By His Honour Judge PARRY.

The Seven Lamps of Advocacy are *Honesty, Courage, Industry, Wit, Eloquence, Judgment, and Fellowship.*

I.

THE eloquence of advocates of the past must largely be taken on trust. There is no evidence of it that is not hearsay. For, though we have the accounts of ear-witnesses of the eloquence of Erskine, Scarlett, Choate, or Lincoln, and can ourselves read their speeches, the effect of their eloquence does not remain. We are told about it by those who experienced it, and can believe or not as we choose. It is the same with actors. It requires genius to describe acting, so that the reader captures some of the experience of the witness. Fielding did it for Garrick when he took Partridge to see *Hamlet*; Charles Lamb can feature the old actors for us on the screen of the written page; but how few real records remain of the eloquence of the advocates of old!

Perhaps the best way to realise their powers is to read their speeches aloud; but even then they seem diffuse and out of proportion to the present interest in the litigation. The most eloquent advocacy that is reported in print is to be found not in law reports, but in fiction—in the speeches of Portia and Serjeant Buzfuz, for instance, where for all time the world continues hanging on the lips of the advocate in excited sympathy with the client.

There are some who think that rhetoric at the Bar has fallen in esteem. The modern world has certainly lost its taste for sweet and honeyed sentences, and sets a truer value on fine phrases and the fopperies of the tongue; but there will always be a high place in the profession for the man who speaks good English with smooth elocution, and whose speeches fall within Pope's description:

> Fit words attended in his weighty sense,
> And mild persuasion flow'd in eloquence.

The test of eloquence in advocacy is necessarily its effect upon those to whom it is addressed. The aim of eloquence is persuasion. The one absolute essential is sincerity, or, perhaps one should say, the appearance of sincerity. As Garrick reminded a clerical friend: 'We actors portray fiction as if it were truth, and you clergymen preach truth as if it were fiction.' It is no use preaching to a jury, but the eloquence of persuasion will work miracles; and there is a well-authenticated story on every circuit of the criminal who, listening with rapt attention to his counsel's pathetic details of his wrongs, burst into sobs after his peroration, crying out, 'I never knew I was such an ill-used man until now—s'help me, I never did!'

II.

It would appear from the history of advocacy that the flame of the lamp of eloquence may vary from time to time in heat and colour. One cannot say that the style of one advocate is correct and another incorret, since the style is the attribute of the man and the generation he is trying to persuade. Yet, however different

the style may be, the essential power of persuasion must be present. He must, as Hamlet says, be able to play upon his jury, knowing the stops, and sounding them from the lowest note to the top of the compass.

Brougham's tribute to Erskine's eloquence is perhaps the best pen-picture of an English advocate we possess, and it is noticeable how he emphasises this power of persuasion and endeavours to solve the psychology of it. He places in the foreground the physical appearance of the man, a great factor in each style of advocacy.

'Nor let it be deemed trivial,' he says, 'or beneath the historian's province, to mark that noble figure, every look of whose countenance is expressive, every motion of whose form graceful, an eye that sparkles and pierces, and almost assures victory, while it "speaks audience ere the tongue." Juries have declared that they felt it impossible to remove their looks from him when he had riveted and, as it were, fascinated them by his first glance; and it used to be a common remark among men who observed his motions that they resembled those of a blood-horse, as light, as limber, as much betokening strength and speed, as free from all gross superfluity or encumbrance. Then hear his voice of surpassing sweetness, clear, flexible, strong, exquisitely fitted to strains of serious earnestness, deficient in compass indeed, and much less fitted to express indignation, or even scorn, than pathos, but wholly free from harshness or monotony. All these, however, and even his chaste, dignified, and appropriate action, were very small parts of this wonderful advocate's excellence. He had a thorough knowledge of men, of their passions, and their feelings—he knew every avenue to the heart, and could at will make all its chords vibrate to his touch. His fancy, though never playful in public, where he had his whole faculties under the most severe control, was lively and brilliant; when he gave it vent and scope it was eminently sportive, but while representing his client it was wholly subservient to that in which his whole soul was wrapped up, and to which each faculty of body and of mind was subdued —the success of the cause.'

And if one reads the speeches of our greatest advocates and the records of those that heard them, one finds that each had some peculiar condiment of eloquence, so that if one could beg a flavour from each one might produce an olio of super-eloquence.

Bethell, for instance, was a master of deliberation, remembering Bacon's maxim that 'a slow speech confirmeth the memory, addeth a conceit of wisdom to the hearers.' Shorthand-writers listened eagerly to his speeches, fearing to miss a sentence that would ruin their report. Repetitions and unnecessary phrases were banned, and useless words he looked upon as matter in the wrong place. His voice was clear and musical, and he had a telling wit. Students from the first thronged the court to learn his magic, and judges listened to him with respect. When he was a junior it is said that Sir John Leach, the Master of the Rolls, succumbing to his arguments, said, 'Mr Beethell, you understand the matter as you understand everything else.' And that was the real secret of Mr Bethell's eloquence.

Serjeant Copley, better known as Lord Lyndhurst, was not a brilliant or showy advocate, but, as a friend said, 'had no rubbish in his head.' He won many of his triumphs by dexterous and successful sophistry and his extreme plausibility of manner. Mr James Grant tells us that 'a perpetual smile played on his countenance while he gazed at the faces of the court and the jury; and there was something so winning in the tones of his voice that he must have been a man possessing a remarkably lively perception of the real facts of a case, of a vigorous intellect, and of great energy of character who was not carried away by Mr Copley's address.' The mere wording of the description might suggest to an unsympathetic reader that Serjeant Copley was the Fascination Fledgeby of the Bar, but the intention of the writer was probably to portray something of that charm of manner which is often a form of eloquence leading to the highest success in advocacy. Gully, in our own day, possessed it in a high degree. It is easy to fall under the spell of it in court, but it would require the pen of a genius to recall it to life on the printed page.

III.

Eloquence of manner is real eloquence, and is a gift not to be despised. There is a physical as well as a psychological side to advocacy, documentary evidence of which may be found in the old prints and portraits of those who have been called to high office from among us. They are, on the whole, a stout, well-favoured race.

Charm of voice and manner has always received due reward. Thomas Denman had a fine, musical voice, an easy manner, and the sincerity and fervour of his address made him a popular advocate. Scarlett was 'the very incarnation of contentedness and good nature.' A spectator notes his 'perpetual cheerfulness,' his 'laughing and seductive eyes,' his 'How-do-you-do style' as he used to stand before the jury, 'fold up the sides of his gown on his hands, and then, placing his arms on his breast, smile in their faces from the beginning to the end of his address, talking all the while to them as if he were engaged on a mere matter of friendly conversation.'

Many an advocate has attempted a similar method with but small success, and there must

have been, as Mr Atlay says, 'an exquisite dexterity' in his method of address that does not reach us through contemporary descriptions. The effect of it was undoubted. A North-Country juryman was once asked, after a long assize at Lancaster, 'What do you think of the counsellors on the Northern Circuit?'

'Why,' he replied, 'there's not a man in England can touch that Mr Brougham.'

'But you gave all the verdicts to Mr Scarlett?'

'Why, of course; he gets all the easy cases.'

It is eloquence that persuades the jury that your case is the easy case. As Cobbett said—and Cobbett had a common jury mind—'He is an orator that can make me think as he thinks, and feel as he feels.'

Mr Montagu Williams has pointed out that the best English eloquence of his time was founded on what he calls a solid style of advocacy. 'As leading examples,' he writes, 'of what I may call the solid style, I should name Serjeant Shee, Serjeant Parry, and Lord Justice Holker. When I say "solid," I do not refer to heaviness of manner, but to solidity of appearance, robustness of speech, and a general air of good English honesty. This style is very taking with the juries of this country. It was the heavy, nay, almost languid, way in which Lord Justice Holker opened his cases, taken in conjunction with his sudden awakenings and bursts of eloquence when important points were reached, that rendered his style of advocacy so telling.'

Nearly every great advocate has found it necessary to make use of the eloquence of persuasion. Charles Russell is the one exception. He did not seek to persuade, he directed the court and jury. Whether or not he was, as Lord Coleridge said, 'the biggest advocate of the century,' he was undoubtedly a very great advocate. Clearness, force, and earnestness were the basic qualities of his eloquence. It was said of him that 'ordinarily the judge dominates the jury, the counsel the public—he is the central figure of the piece. But when Russell is there the judge isn't in it. Russell dominates every one.'

But no man can dominate a jury in a doubtful case, and though Russell was supreme in a good case, he had not that power possessed in a high degree by another great advocate—still, happily, among us—Sir Edward Clarke, who could not only insinuate doubts into the hearts of the jury, but could leave his arguments so clearly in men's minds that he became, as it were, the thirteenth man on the jury when they retired to consider their verdict. This requires real eloquence.

IV.

The moral of the lives of the advocates seems to be that in the house of eloquence there are many mansions, and any style natural to the man who uses it is his right style, and may succeed. One besetting sin of many would-be eloquent speakers is fatal, and that is bombast. The young advocate who opened a libel case, 'My client, gentlemen, is a cheesemonger; and the reputation of a cheesemonger is like the bloom upon a peach. Touch it, and it is gone for ever,' must have been immune from eloquence. Yet there are solicitors and clients who still like that kind of thing, and advocates who supply it.

Nearer to eloquence was the advocate who, in defence of a woman for child murder, said in passionate tones: 'Gentlemen, it is impossible that the prisoner can have committed this crime. A mother guilty of such conduct to her own child! Why, it is repugnant to our better feelings! Gentlemen, the beasts of the field, the birds of the air, suckle their young——'

The simile might perhaps have passed with the jury had not a dry, unsympathetic voice from the bench interrupted with: 'Mr X, if you establish the latter part of your proposition, your client will be acquitted to a certainty.'

And though eloquence at its highest is a gift, the art of speaking can be learned and personal difficulties overcome. Demosthenes, with his pebbles in his mouth or running up a hill spouting an oration, has been an example to us from the schoolroom. Cicero took lessons from Roscius and Æsop. Lord Guildford, Lord Campbell, Lord Brougham, and others have impressed on students the importance of attending and practising at moots and debating societies. The mechanics of eloquence can be as certainly learned by the student as the mechanics of etching or engraving, but how far these will make an artist of him and help to bring real eloquence to the learner lies in himself.

There is no golden rule of method, but there is this golden principle to remember, that the message of eloquence is addressed to the heart rather than the brain. This is well put by Lord Chesterfield, who was more human than many will allow, when he wrote to his son: 'Gain the heart, or you gain nothing; the eyes and the ears are the only road to the heart. Merit and knowledge will not gain hearts, though they will secure them when gained. Pray have that truth ever in your mind. Engage the eyes by your address, air, and motions; soothe the ears by the elegancy and harmony of your diction; the heart will certainly follow; and the whole man and woman will as certainly follow the heart.'

Thus is the grammar of the matter set down by a skilled grammarian, yet it is but a bundle of dry sticks and kindles no flame. The high privilege of lighting the torch at the lamp of eloquence is a gift of the gods, and orators are born, and not made.

OUR ESCAPE FROM MOSCOW.

By F. FLATAU.

PART I.

I.

EVERYBODY who has been in Moscow before the war knows what a beautiful city it is, and how delightful life used to be there. Though we are Poles, we had lived a good deal in Russia, where we had estates, and where we spent the summer, and so it happened that when Warsaw was taken by the Germans in 1915 we were among the Polish refugees who sought safety in Moscow during the occupation. But after the Revolution broke out many things changed there, and, especially after the Bolshevik insurrection in October 1917, life grew worse and worse, until it became almost impossible to bear it. I am not going to describe all its horrors—enough to say that all kinds of epidemic illnesses (chiefly typhus), famine, and cold soon followed. Quite fabulous prices were paid for food and fuel; people died by the thousand from disease and insufficient nourishment.

The political terror that reigned in Russia has often been described. People were deprived of all their belongings, and on the least suspicion were arrested, and either shot or kept for months in prison, which meant almost certain death from typhus. Many persons of my acquaintance, not being able to leave Moscow, committed suicide, as the only way of escaping from such terrible conditions of life.

When I myself turned very ill, the doctor said that to save my life it was necessary for me to be taken away from the 'Socialistic Paradise.' Our one idea was how to get away from Moscow. To the reader this may seem a simple enough matter, but in Russia people had long ago forgotten what it was to buy a ticket and to travel in the ordinary way. Even to go from one town to another of the ex-empire one needed a special permit from the Soviets, who usually granted it only to their own members or to workmen organisations. As to going abroad, to Poland, while it was at war with Russia—even to plan such a thing was sheer madness.

We tried all the legal ways to get passports to Riga, Roumania, or any other country, but even the doctor's certificate was of no avail. 'Let her die here. She cannot get away,' was all the answer we obtained from the most powerful authority in Russia, the 'Tcheresvytchaika' (Committee of Public Safety). As all our attempts proved useless, we decided to risk it, and to go illegally. We were quite aware of the fact that if we were caught on the way our fate was certain, as had been that of so many friends of ours who had tried the same experiment. Confiscation of all our belongings and imprisonment awaited us—imprisonment for an indefinite period. What might have made things still worse for us in case of discovery was that we were taking with us important documents and ancient jewellery that we were loath to part with. Jewellery, as well as documents of the kind we had, we ought long ago to have delivered to the Bolshevik authorities, according to decrees. As to hiding things from the Bolsheviks when they search your luggage, the very idea is absurd. Sherlock Holmes, with all his astuteness, is a mere apprentice compared with those detectives of a new epoch.

Luckily we had among our friends an engineer who had a railway-car at his disposal, and could travel from Moscow down to the very front whenever he thought fit. He agreed to take us in his car, and soon after Easter we started on our expedition, needless to say without telling any one where we were going. The departure itself was arranged in almost a conspirative manner. We stood at the side-entrance of the station, waiting for our friend Mr V. My heart was wildly beating as time passed and he did not appear. At last, after nearly an hour of dreadful suspense, we caught sight of him, and with immense relief followed him on to the platform and into his car. The sentries, seeing such an important person leading us, never dreamt of asking us for any permit.

The car in which we spent the following three nights and days proved a very comfortable one, and Mr V.'s company most agreeable. Those were the last days for a long time to come that we were to enjoy comparative comfort and intercourse with intelligent human beings. What was, perhaps, even more important, in this car we were safe from prying eyes and from inquisitive

 [*All Rights Reserved.*]

questions. At dawn, on a Sunday, we arrived at Sl——, and saying good-bye to our kind friend and to our dear car, we plunged into uncertainty, unknown adventures and dangers that were to last for the next five weeks.

II.

Sl—— is a small railway station on the line Moscow–Warsaw (to be more exact, it lies between Smolensk and Minsk), and, going straight on by train, we should have arrived in the course of two or three hours at Boryssow, the first Polish town as the front was at that time. But this was obviously out of the question; so we consulted a trustworthy Jew, into whose hands Mr V. had passed us over, as to the direction in which to continue our journey. This man called in a friend of his, Mr K., a rich Jew who owned horses and carts; and the result of our conference was that Mr K. would provide us with a horse and cart, and that early next morning we should drive off to B., a small town on the river Beresina. There, we were assured, we could quite easily cross over to the Polish side, as, that section of the front being quite unimportant, there were hardly any soldiers near B.

We spent the night at the first Jew's hovel (on hard benches, amidst hens, goats, and seven or eight dirty brats), and early next morning started on our journey to B. The sight of us in our travelling-attire must have been rather funny. Imagine a peasant's cart, our luggage at the bottom, completely covered with straw, on top of which we sat, dressed in most 'proletarian' clothes. In patched old costumes, worn-out boots, no hats, but handkerchiefs tied round our heads, we made the impression of anything but rich people. I have not yet mentioned that our family consisted of five members: my mother, an elderly lady, accustomed all her life to travel with the utmost comfort; my husband, myself, and our two children, a boy of ten and a little girl of five. We could not look at each other without laughing; the sight was too funny for words.

The drive was very pleasant. We were passing through pretty fields and woods, and the weather was lovely—not too hot, but very fine, a blue, cloudless sky over our heads. The Jew's son was driving us himself, a nice lad of eighteen, who seemed well acquainted with the road and all its details, and knew how to drive so as to avoid meeting any Bolsheviks. In the middle of the day we had a meal in the wood—a picnic, in fact, and a rest from our very shaky cart. The whole day our children were singing happily, and we were in the highest of spirits; everything was succeeding better than we had expected; we were quite sure of a quick and lucky end of our journey, and of being next morning in our dear Poland.

Towards evening, at the entrance of the village D., we were stopped by a sentinel, who wanted to see our permit. We had taken the Jew's advice and obtained (for money, of course) a certificate from the local Soviet in Sl—— that we were refugees from a village near B. that had lately been burned down by the Poles. On seeing this paper, the soldier let us pass without a word. We looked exactly like poor refugees.

After sunset we came to a farm, some ten miles from B. and from the frontier. According to our plan, we were going to spend the night at this farm, and to continue our journey next morning. We jumped off the cart and stretched our tired limbs. The sky was covered with stars, the air was pure and lovely, and the silence around us complete. This farm lay solitary on the top of a hill.

At the noise of our cart-wheels, a peasant ran out of the house to greet us. He was a pleasant-looking man, with fair hair and beard, and he was dressed, like all the Bialorus peasants (White Russians, as the inhabitants of that province are called), in snowy-white shirt and trousers made of coarse home-spun linen. He greeted us heartily and invited us into his house—rather cottage, or *hata*—a quite new, clean wooden building, consisting of one large room. A broad wooden bedstead stood in one corner, while in the other, or 'clean' corner, as they call it, under the Saint's picture (*ikona*), stood a wooden table; broad wooden benches were ranged along the walls. This was all the furniture. Almost a third of the room was taken up by the big Russian stove. Four small windows let in the silvery moonlight.

Artem (the peasant) at once made a fire, boiled some potatoes, brought us eggs and milk, and we greatly enjoyed this rustic supper. 'And where are you going to, my friends?' asked our host. The young Jew, our coachman, informed him of our plans and wishes. On hearing these Artem exclaimed, 'What a pity you didn't come four or five days ago! *Then* you could just have driven down to the river, given a sign to the Polish sentinel, and they would soon have helped you across. But now it is quite impossible. A few days ago the Bolsheviks sent soldiers to the river-shore, into the trenches, and one cannot pass there any longer.'

The reader can well imagine what our feelings were on hearing this! And so our expedition, that had begun so well, was now at an end; either we should have to return to Moscow—appalling thought!—or else make for some smaller town in Russia, there to await the end of the war. Our disappointment was the more bitter because of the thought that, had we come only a few days sooner, our plan would have succeeded brilliantly.

Artem, seeing our disappointed faces, said, 'But wait. To-morrow at dawn, while you are still asleep, I shall run across the marshes to the

nearest village, Sh——, to my nephew Michael's, and see what he can do for you. He has a small boat on the river, and he often goes across and back for salt.' (Evidently he was a smuggler.) 'Perhaps he will take you through the wood, where there are no soldiers, and then in his boat across the river' (Beresina, then the frontier between Russia and Poland). This promise gave us some hope, and so we settled down for our night's rest, my mother, my little girl, and I on the wooden bed, on straw; the men (my husband and son, our host and the coachman) on the benches along the walls.

III.

We were so tired after the shaky drive of the day before that next morning, instead of rising at five or six, as we ought to have done, we slept till eight or nine. That was a great mistake. Our host told us that we were to start at once, as his nephew Michael at Sh—— was willing to take us across the Beresina in his boat. We were to part now with the Jewish lad, our coachman, and to drive with Artem's father, a silly-looking old peasant. But before leaving we wanted to get rid of part of our luggage, remembering how uncomfortable we had been the previous day, sitting on certain hard boxes. Very soon, on hearing that we were selling things, a crowd of Artem's relations, big and small, men, women, and children, gathered around us, examining the goods, and greedily snatching things away from each other, like a crowd of savages! All this business lasted till past eleven o'clock, and it was already noon before we left the farm. That was our second mistake.

We drove now to Sh——. Wishing to pass unnoticed by Bolshevik soldiers who might be wandering about, we did not go by any road, but through marshes in a thick forest, and even three times crossed a small river without any bridge, the cart-wheels deep in the water. This four miles' drive was anything but pleasant. The sky was gray, heavy clouds hung low, and our spirits were far from being what they had been only twenty-four hours before. Nobody was singing to-day, and, full of misgivings, we spoke in hushed whispers. At last we arrived at Sh——, and were driven straight into the courtyard of Michael's house, just as a fine, drizzling rain began to fall. We waited in the courtyard while, inside the cottage, a great conference was going on between Michael, Artem, and the silly-looking old Peter. At last Artem came out, saying, 'We must immediately return. Michael refuses to go on. He is afraid. The wood is full of Bolsheviks.'

We used all our powers of persuasion to make him change his decision, but it was of no avail. We offered him more money, but Michael only replied, 'If they catch us, they will take my house from me, my cattle, all I have. No, I am not going. And leave my place at once.'

We begged to be allowed at least to spend the night in his house. The rain was falling fast now; the sky was dark and threatening; we had not eaten anything since early in the morning. But he did not even take pity on the children, and bade us go at once, as he did not wish to get into trouble with the Bolsheviks, whom just at that moment we heard firing in the neighbouring wood. So, having no choice, we moved on; and, as it proved afterwards, not a moment too soon did we go. We were hardly out of the village when members of the local Soviet came to Michael's house and inquired who the strangers were who had just been there.

Now we were going back to the farm, this time not through marshes and rivers, but by the road. The rain was pouring in torrents; it was getting quite dark, and, what was even worse, soon an awful thunder-storm broke out. We drove like this for more than three hours, the water running down our heads, faces, and clothes; we were wet through, shivering with cold, hungry, and miserable. The poor children were silent, bravely bearing their lot. No shelter was to be seen anywhere, and, what was still more trying to our tempers, the silly-looking old Peter, over fond of his horse, and pitying him far more than us, would for nothing in the world be induced to hurry his precious old animal, but just let him go on at his usual quiet, imperturbable pace.

At last we arrived at Artem's farm, wet through, cold and hungry, the very picture of misery and baffled hope.

After a sleepless and miserable night, we held a consultation as to what to do next. For the present there was no hope of getting across the Beresina, so we had the choice either to return to Sl——, or even to Moscow, or else stay at the farm and wait for some lucky chance. This latter course, we were quite aware, was very risky. We might be found out and shot as Polish spies, or, at least, arrested, and have all our things taken away from us. Even if we were lucky enough not to get caught, who knew how long we might have to stay there? Perhaps during the whole summer nothing would change in the position of both armies; gradually autumn and winter would come, and what then? However, we decided that, having come so far (or, rather, so near the front), there we would stay and wait for our chance.

And so it came that we spent three weeks at the farm. Artem allowed us to stay there, but told us to look for our food where we liked, as he could not give us anything. For three weeks we ladies slept on straw, without once being able to undress ourselves for the night, as in the same room, on the benches, slept my husband and son, and also Artem with his

wife and child. They were kind, honest people, but perfect savages. When we washed ourselves or cleaned our teeth, they and their neighbours would come and stand in front of us, watching and wondering what we were doing. All the things we did seemed strange to them, and they considered us like beings quite apart. But do not let the reader imagine for one moment that they thought us superior beings—far from it. Very soon I discovered that they looked upon us with a kind of pitying disdain. In their eyes we were poor, helpless creatures, who did not know much of what is most important in life; slaves of our habits. Those very habits (like washing, &c.), the outcome of a culture many centuries old, seemed to them not only useless, but even harmful!

We soon came not to take any notice of them and their visitors, who would drop in at any time between dawn and midnight (the door of the *hata* never being locked) and watch our doings. Whether we were dressing, eating or resting, reading or sewing, we always had an audience, mostly consisting of women and girls in dresses hanging down to the floor (even girls of six wear long dresses!), with handkerchiefs tied round their heads. Men would come in in the evening, and often, while smoking their horrid tobacco, talk about politics or discuss the Great War, as most of the younger ones had taken part in it; and, indeed, many had only lately returned from Germany, where they had been prisoners. Of course, at night we had neither lamps nor candles, only the light from the glowing stove.

IV.

From first to last, during our stay at the farm, we were confronted by the two main questions: how to get our food, and how to hide from the Bolsheviks. The first of these questions was solved in the most unexpected and original manner. At first we thought that we should have either to starve or to go away, as the peasants would not sell us anything to eat. They all had heaps and heaps of money, and didn't want any more of it, as it could not buy for them any necessaries, owing to the fact that in recent years Russia had not produced anything. If we had things to give them in exchange for milk, bread, butter, and eggs, good and well; if not, they preferred to eat those good things themselves. We were in a sad position, having very few things with us that we could give them in exchange for food. We also could not go to more distant farms in search of provisions for fear of meeting Red Army soldiers.

At last it happened that a woman to whom I had given some medicine (for toothache, I believe) told her neighbours that we knew how to cure diseases; and from that day I had, early and late, the *hata* full of patients, mostly women with sick children. I had a small store of medicine for our own use, which, as you see, proved very useful. I could tell you many stories, pathetic as well as comic ones, about my experiences with those patients, but that would lead me too far afield; enough to say that many people I really cured (owing to some practice I previously had had in the country in Russia, where doctors usually are few and far between). Others, with chronic diseases, I honestly warned that they could not get cured so quickly and in such a way, but they usually insisted on my giving them at least some drops. I am certain, however, that those drops did not do them any harm, even if they could not effect a cure, because I gave only quite harmless stuff. In exchange, my patients, or their parents, brought us quantities of eggs, also milk and flour or bread, once or twice even fish; and so we did not starve, and my practice flourished.

Other articles of exchange were a number of ribbons I chanced to find among my few belongings. The village belles from far and near would bring me eggs for pink, blue, and green ribbons—the brighter the better. But the greatest success was a small bottle of eau de Cologne my husband discovered in his bag. Several drops of it sprinkled on Artem's sister (a shepherdess), going to a village dance, produced the most unexpected result. Next day a young peasant came with a parcel. He had heard, he said, that we had 'scented water,' and for a small bottle of it offered us some two pounds of bacon that he unwrapped out of his parcel. I suspect he had stolen it from his parents' cellar.

My practice made us well known in the neighbourhood, and this notoriety, though saving us from starvation, exposed us to the danger of being discovered by the Bolsheviks. There were few in the nearest villages, but quite sufficient for us. Besides, they had a telephone connection with some staff or other of theirs, so could immediately let the authorities know about 'suspicious bourgeois' living at the farm. We even met several times Red Army soldiers going about in search of food; but as we never manifested either fear or surprise, they somehow did not take any special notice of us, probably thinking we had a right to be there. The neighbouring farmers all knew, or suspected, what our real intentions were in staying so long at Artem's; but we were not much afraid of their denouncing us, as most of them had excellent reasons for not wishing to attract the authorities' attention to themselves, or, rather, to their sons, who all ought to have been in the ranks of the Red Army instead of working on their farms. Thus we lived on in comparative safety, never forgetting, however, that, if discovered, at least my husband would be shot as a Polish spy.

MAN'S WORK.

CHAPTER XI.—*continued.*

III.

ON the morrow Shanklin went first to the firm from whom he had bought two thousand dollars' worth of casings, for which he had paid cash. He dared not say too much, and was afraid to say too little. The manager listened attentively, though he had heard such tales before. 'I'm sorry, I can't. The firm wouldn't stand for it. If you had a good lease on good ground we'd furnish you with supplies on slow payment, but we can't do that with wild-catters.'

So that was it. As a matter of fact, the partners had been content to be called wild-catters. It minimised publicity and diverted eyes both curious and intelligent. But Shanklin wondered whether the hand of Sitwell were not visible here.

By mid-afternoon he wondered no more. There was not, apparently, four thousand dollars available in Los Angeles. Everywhere it was the same—a patient hearing, regrets, and a careless 'Good luck to you!' He thought of Burley; but what Burley had offered was legal advice, not money. Presently he sickened of the city, and, striking west, came to Pasadena, where he stood for a while gazing at a certain red-roofed bungalow now occupied by two young strangers, who seemed inordinately happy. At that he retreated, and got a lift southward. Nearing his own well, it was pointed out to him as the latest wild-cat. He thanked the man and got out.

At Harrison's interrogative nod he shook his head, then noticed that drilling had stopped.

'Engine trouble—started as soon as you left. Tinkered over it for a while, then sent in for a duplicate. Five hundred dollars.'

It was discovered a little later that the piston-rings, cylinders, and valves had been heavily cut and scored. They puzzled over this till Harrison swore viciously. 'I've got it—emery-sand in the oil. Try that drum.'

A minute later he rubbed the gritty stuff into his hard palm. The muscles of his face were standing out in ridges. 'Sitwell again!'

Shanklin nodded. 'You'll never prove it. Filter the oil.'

Another week dragged out. The ground was a little softer, and this helped to make up lost time. Came the 5th of August. Money was low, and five hundred feet remained to be driven.

During this period both partners seemed to acquire the ability to live without sleep, save an hour or two snatched when opportunity served. They were bleary-eyed and dirty, but tireless, being driven by the sting of acute necessity. The irony of it was that every foot driven brought them nearer the point when funds would disappear altogether. Harrison began to talk about his farm. 'I'll sell it; then, if I'm broke—I'm broke.'

But Shanklin would have none of it, being definitely opposed to gambling other people's property without their approval. He ransacked his own brain to no purpose.

They had posed as wild-cat speculators, and were accepted as such. The clank of machinery began to reverberate in his very soul—its reiterant note suggesting that he was forging his own destruction. He stared at the peaks of the Sierra Madre as he used to stare months before; but now they seemed colder, more distant and forbidding.

IV.

At the end of the first week in August a big touring-car pulled up by the roadside, and Shanklin saw a laughing group loiter under the orange-trees and move slowly towards him. It was Sunday, and since morning the highway had been populous, but now he rarely looked in that direction. In the middle of the group was a girl, tall and very fair. He puzzled over this for a moment, then remembered. It was the girl of the restaurant.

It was not till he had been plied with questions about the work that she glanced at him with dawning recognition. He was dirty, unshaven, and his eyes had the glassy suggestion of sleepless nights. There was little about him to recall the immaculately dressed man who, having hit once, and hit hard, had tucked her arm protectingly into his own, put her in a taxicab, and walked off without a word. She had wondered who was the girl who stared at them so strangely in the doorway, and concluded regretfully that it spelt trouble for some one. That was all weeks ago, and nearly forgotten. Now the matter became vivid again.

Shanklin touched the brim of a disreputable hat. 'Good-morning.'

The girl coloured a little. 'I didn't know it was you at first.'

'I'm not surprised. Interested in oil?'

'No; but my father is.'

Shanklin mustered a grin. It was good to forget, if only for a moment. 'I congratulate your father on the result of his work.'

She laughed a little. The others, having glanced at the derrick and wandered aimlessly about, had already turned towards the grove. There was nothing exciting about this well.

Their laughing voices grew fainter. The girl looked at Shanklin earnestly.

'You never let me thank you for that night; you never even asked my name.'

'There was nothing to say "Thank you" for.'

She shook her head with decision. 'You wouldn't say that if you knew what happened afterwards. I only heard it two days later. I've finished with that crowd.'

He nodded, and she went on earnestly: 'It woke me up.' Then, after a straight glance, 'I needed waking up. Have you been here ever since?'

'Ever since.'

'And when do you finish? This isn't your real work, is it?'

'The well finishes—or we all do—by 1st September. Yes—this is my real work.'

'You don't look it. Why do you say that?'

'Because it happens to be the case. I don't tell stories.'

A shout reached her from the roadside, and she waved her hand. 'Well, I'm awfully glad to have seen you, and to be able to say "Thank you" at last. And good luck by the 1st of September—all kinds of luck. I know you deserve it.'

She extended a long, white hand. Shanklin touched it with stained fingers. Then she turned, and ran straight into Denison, who had emerged, rubbing his eyes, to take over the shift. 'Bill!' she stammered. 'Where did you come from?'

Denison pulled himself together with amazing swiftness for a man stupefied with sleep. 'Hullo!' he answered unsteadily. 'I can say the same for you.'

'I—I haven't seen you for a year.

'That's not my fault. I—I didn't reckon you wanted to see me.'

She glanced at him uncertainly. 'Don't go back over it, Bill. Have you seen father lately?'

His mouth opened a little. He looked at the camp and crooked his finger. 'Come here.'

She followed, and he pointed through an open window. Peering in, she saw Harrison stretched in his bunk, regardless of the sunlight that streamed over his face. He was dirty and exhausted. One hand hung limp, and she discerned the hard, smooth palm, the knotted fingers, the wrist with its tiny, dark, ingrained lines. His shirt was wide at the neck, revealing massive muscles and the strong column of his throat. He lay, breathing in long draughts of air, his head thrown back; a weary man snatching an hour's oblivion, seeming very much alone and remote from the sweet and joyous things of life. Tears started into the girl's eyes as she looked. 'What's the matter, Bill? Have things gone wrong? Every one looks—well—desperate.'

'If we get oil by the 1st of September, it's all right. If we don't, we're broke. Matter of fact, we're broke now.'

'I don't understand.'

Denison told her as much as he knew—told her jerkily, with pauses and breaks that made the story utterly convincing—a plain, unvarnished thing that carried pathos and pride in every word. She listened, her eyes wide, her breath coming faster. Once or twice she started up to run to Harrison, but her one-time lover put out a retaining hand.

'Don't wake him just to tell him—well—that you're fond of him. He needs sleep, more than anything else—except money. He won't sell that ranch he's holding for you; he won't mortgage it; he won't touch it. Says you may need it some day—though you don't seem to realise that. I'm not saying anything about myself, Gertie, for I've only put in some work. The others have put in all they've got.'

'Money?' she said quickly. 'How much?'

'Shanklin reckons three thousand dollars would do it. We've had bad luck—but it wasn't that either. We're fighting the men who want this lease, and there's nothing they haven't tried to knock us out. That's why we look desperate.'

She sprang to her feet. 'Bill, forget everything I ever said to you before, and stay where you are till I come back.'

She raced to the impatient group by the big car, which shortly moved off with a wondering cargo. Then she sped back to the camp. On the threshold of the bunk-room she paused for an instant, and tiptoed in.

V.

Harrison stirred in his slumbers. His brain had set a watch for the quick steps that came so often, for they meant trouble. But this time while he struggled with lethargy there was no deep voice with its depressing message, but a touch of something against his palm, and a whisper, soft and caressing, that reached him like balm and sent him back to dreams of long ago.

'Dad—dad—speak to me.'

He sighed, and lifting himself on one elbow, opened his heavy eyes. Gertie was leaning over him—a flower in all her dainty beauty, a strange visitor in this atmosphere of sweat and work. He stared at her, unbelieving at first, then with a sudden light in his eyes.

'Girlie—girlie—what brings you here? Be careful; you'll dirty your dress.'

That was too much, and she pressed his head to her shoulder, her lips quivering, her cheeks wet. Dirty her dress! All her life it seemed she had feared it, while he, steadfast and uncomplaining, made no protest. She thrilled with a swift revulsion of feeling.

'Dad, why didn't you write to me?'

He patted her hand. 'What about?'

'This—and all your anxiety.'

He looked slowly round the disordered cabin. It called him back to actualities.

'Oh—this—why worry you with it? I've worked hard all my life.'

Every word seemed to condemn her the more, and her heart filled with a pure natural emotion that sprang from suddenly stirred depths. She recalled the years during which he had asked for nothing—and given himself utterly.

'Dad, you should have let me know.'

He glanced at her with dumb affection. What had she to do with grime and stress and effort?

'It's man's work, girlie, not yours.'

She shook her head. 'I've seen Bill, and I know all about it. Now what can I do to help?'

He smiled a little at that. She was so dainty and delicate; but she went on persistently, with a deepening conviction that destiny had asserted itself in bringing her here. There must be something she could do to compensate for the things she had left undone.

'Just how much did Bill tell you?'

'Enough to make me feel I'm the poorest excuse for a daughter in California.'

He chuckled at that, stroking her arm almost timorously, as though he might hurt it. But the caress seemed to reach her very spirit.

'There's nothing needed—but money. You can't help, daughter.'

'How much?' she asked quickly.

'Three or four thousand.' He spoke dully, as though he might as well tell her, however futile it was.

The white brow wrinkled a little, and he watched her hungrily, realising each successive moment how desperately he had missed her, and how strange she looked in this drab setting. The yellow hair seemed to absorb the sunlight and radiate it again like a golden lamp.

'How is it with you, daughter? Things going well?'

'Don't!' she expostulated. 'Nothing counts but you now. Yes, I'm all right. Isn't it queer that I know all three of you?'

'Do you?'

'That other man—his name is Shanklin, Bill told me. I owe him something, too.' She told him the story, sparing herself not at all.

'I was a fool,' she concluded, 'but I'm out of that for good, thanks to him. Now let me think.' Presently she jumped up. 'I'm going into the city now, and will be out again first thing in the morning. Till then don't worry, dad, more than you can help. I want to pay back a little—just a little—and there isn't a minute to spare, is there?'

'Not many,' he admitted; 'but——'

'There are no buts! Can I get a lift in from here?'

'A motor-bus passes every hour—about due now.'

'Can Bill walk down with me?'

Harrison grinned. 'Ask him.'

She went off a minute later, a dark stain on her white blouse, but eagerness in her spirit. Her arm was linked with Denison's. Shanklin looked after them, and, smiling, saw Harrison at his elbow.

'You never told me about that little affair at the restaurant. Queer it was Gertie—isn't it?'

But Shanklin somehow did not think it was queer. He was beginning to be aware of influences, faint and elusive, that shaped the affairs of men with invisible touches. Harrison's reunion with his daughter would do more to fortify him than anything else. There was something in the thought that brought with it a shadow of dejection. What would he himself not give for reunion with the girl he loved? And how remote it was!

Gertie reappeared at noon next day, racing up from the highway, dressed in plain, workman-like clothes, her cheeks pink, a small bag in her hand. Harrison went to meet her, feeling unaccountably younger.

She flung her arms impetuously round his neck.

'I've had a tremendous rush, dad, and got rid of a lot of silly things I didn't need for two thousand dollars. Here it is—and I'm sure we'll find the other two. And, oh, I've come to stay—so you can fire the cook.'

TOURAINE AND SCOTLAND.

By T. B. Simpson.

I.

TOURAINE has long been celebrated by scholar and poet alike as the true France. The home of Rabelais and Balzac, it is 'the land of easy life, of revellings, and many delights.' And, perhaps on that account, it is full of historical memories, for throughout the Middle Ages it was here that the great captains made their battle-ground, and the gay Court of France its playground, until the degenerate taste of the more modern French kings turned for new building-sites to the neighbourhood of Paris. The early history of England is so necessarily interwoven with that of France that it does not require the learning of Macaulay's schoolboy to remember that King Stephen came from Blois, or that the great Henry II. died in the Castle of Chinon, muttering, 'Shame, shame on a conquered king!' But leaving on one side the mass

of historical facts connecting England with France, more especially in those early days when the kings of England spent the greater part of their restless lives on the Continent, the loyal Scot, with a patriotism perhaps narrower, but no less ardent, can find not a few points of contact between his own gray fatherland and 'the plains where nature is puissant and gay.'

The interest will be found to centre chiefly round two topics: the life of Queen Mary and the history of the Scottish Archers in France. A considerable part of Mary's life in France was passed in the châteaux of Touraine, to which she looked back with longing from her prison.

> I was the queen o' bonnie France,
> Where happy I hae been.
> Fu' lightly raise I in the morn,
> As blithe lay down at e'en.

The poor queen's adieu to France might have been still more regretful had she known what was in store from the chill mists of Holyrood, and the still chiller blasts of John Knox's Trumpet.

Chenonceaux, most perfect of all the châteaux of Touraine, enjoys romantic associations with Marie Stuart, for here she came more than once, shortly after her marriage in 1558, to seek sport and pleasure with her husband, the boy dauphin, afterwards Francis II. This girl, who excelled at Latin orations, who was 'well versed in politics at ten, and mistress of the French Court at fifteen,' 'sly as a soubrette, wise as a professor, proud as a Stuart, and passionately in love,' must have been something of a puzzle to her fifteen-year-old husband. In Chenonceaux it requires little imagination to picture the youthful pair dancing in the lovely gallery across the Cher, or angling from its projecting piers for the sluggish fish that swim beneath the arches. Nor can romance be altogether destroyed even by the fact that the castle is now the property of M. Menier, of chocolate fame. Indeed, any man who can afford to line his billiard-room with Titians and Correggios may well be thanked for still admitting the vulgar tourist at all within his walls. Before we leave Chenonceaux, it is interesting to note that it owes much of its preservation to one Madame Pelouse, *née* Wilson, of Glasgow, who became its châtelaine early last century, and did much to restore it and keep it in order.

A neighbouring castle has grimmer recollections—that of Amboise. Francis and Mary were here received in state in November 1559; a few months later one of the most frightful massacres which disgraced even that intolerant age took place in and around the château. Fifteen hundred Huguenots were slain by the authority of the Guises, Mary's uncles, who were responsible for bringing her to France, and to whom she was deeply attached. Largely at the instigation of the queen-mother, the inhuman Catherine de Médicis, the whole Court, men, women, and children, were brought out on to the balcony of the castle to see the culminating scene of the butchery. When gallows and scaffold had taken their full toll, many victims were hanged from the balcony itself, which is still known as the Balcon des Conjurés. It is little wonder that Francis sickened at the sight, and that the case-hardened Catherine found it necessary to carry off the youthful pair to drown their recollections of such scenes in new revellings at Chenonceaux.

Mary's connection with this part of France was not severed even when she ceased to be queen, for when, late in the same year, she was left a widow, she was given the Duchy of Touraine as an appanage. It is especially unfortunate that there now remains no authentic portrait of the period in any of the castles of Touraine. In the older books dealing with the neighbourhood mention is made of a picture at Azay-le-Rideau, showing both Mary and Francis; but inquiry revealed the fact that this portrait was sold at public auction fifteen years ago, and that the name of its present owner is unknown.

In Tours itself died another Scottish royal lady, Margaret, wife of the dauphin Louis, later to be known to fame and dishonour as Louis XI. She was only twenty-two at the time, and it is supposed that her husband was not unconnected with the event. 'Done to death by slanderous tongues' is Scott's appropriate quotation. There is still preserved at Amboise a sword presented by James I. of Scotland, Margaret's father, to Louis XI. on the occasion of the marriage.

II.

The pages of *Quentin Durward* have made every reader familiar with the Scottish Archers, who formed the King's Bodyguard in France. This corps was instituted in 1418 by Charles VI., when assistance was urgently needed against Henry V. of England. It was not finally disbanded till 1830. The archers attained their greatest importance under the calculating Louis XI., who secured his position by tampering with their loyalty before he came to the throne. In this and the succeeding reigns they enjoyed an influence quite disproportionate to the strength of their corps as a military unit, and, by constituting in the king's hand a strong, mobile body of mercenaries, contributed in no small degree to the decline of the feudal chivalry. Treated with great favour, they were gorgeously equipped and generously rewarded. Members of the guard, it will be found, have left their mark, in more senses than one, on the castles of Touraine. It is with Plessis-lez-Tours that the student of Scott will naturally associate them, but unluckily little remains of the great stronghold where Lord Crawford and Le Balafré did their duty. The castle is now represented only by an insignificant structure, to which it is difficult to secure admission. To do so is hardly worth the trouble, for in truth the real

Plessis has disappeared. Two kilometres distant, however, in the heart of Tours itself, and connected with the castle by an underground passage, stands the house of Tristan l'Hermite, Louis's notorious hangman, and on the roof of the unique brick staircase in this building there is the stone figure of a Scottish archer. He wears a bonnet and body-armour, much as described in *Quentin Durward*, and is armed with a bow fully as big as himself. How long he will remain there is another matter, as visitors from both America and Scotland have attempted to buy him.

The rugged fortress of Loches brings home most vividly to the inquiring tourist the existence of those early Royal Scots, for here he is shown what purport to be their beds. These are vast and most uncomfortable-looking structures of solid wood, in each compartment of which two archers are said to have reposed. They stand in the outer guard-room of the Donjon, in which De Comines the historian was imprisoned, and Sforza of Milan died of joy on being told that he was free. In the same room is a heavy iron collar in which such prisoners as were doomed for immediate death were forced to stand on tiptoe until strangled. Our ancestors must have needed good nerves to enable them to sleep placidly in such surroundings. The guide, who informs the visitor with pride that his first reading was 'Cawtan Dürvar et Le Balafré,' stated that in the time of Louis XI. the colonel of the Scots at Loches was one M. Kelburn.

An even more enduring trace of these gallant soldiers of fortune is to be found in the château of Chenonceaux. Here in the chapel of Catherine de Médicis are inscriptions cut in the stone, in a fine sixteenth-century hand, by one whose nationality is revealed, among other indications, by his spelling of the word 'deid.' 'Be not overcum by Evil,' he writes, in plain reference to the behaviour of his odious mistress; in another place he makes a further reflection upon her life and doctrine in the words, 'The Ir of Man virks not the justice of God.' It is curious to see these solemn admonitions in the clean white stone, looking as fresh to-day as when they were cut, nearly four hundred years ago.

The Archers played their part in helping to extirpate the unfortunate Huguenots at Amboise in 1560. We find them at Blois in December 1588, when the Duc de Guise in his turn came to a violent end. As he ascended the staircase, to be met by the daggers of his assassins, we are told that he was stopped by a man-at-arms, the Sieur de Larchant, who entreated him for some favour for the Scottish guard from the king himself. The only favour which the Duc at least received was, as he lay dying, to have his face spurned by the heel of the wretched creature, Henri III. In this same château James V. of Scotland was betrothed to his first wife, Madeleine de France.

With later monarchs the Court of France made its permanent headquarters in the palaces of Paris, and Touraine knew the Scottish Archers no more. It is hardly fanciful, however, for the Scottish visitor to Touraine to suppose that some recollections of the Auld Alliance still linger in the minds of our neighbours over the water, so kind is the welcome which everywhere he receives.

SIR MALCOLM'S HEIR.

PART II.

V.

RONALD went to his place opposite. The girl had exonerated his offence. He fell to on the scone.

'We hardly expected you so early,' the girl told him. There was a dimpling hint of mischief in the corners of her adorable mouth.

'No,' said the lady. 'But I expect your father will be home to dinner. How delighted he will be to find you here!'

Ronald's jaw fell. 'I wish I, too, could be sure of that,' he replied, answering the mischief that had now leapt into the girl's eyes.

'Oh, Ambrose!'

'Damn it! is *that* my name?' Ronald thought to himself. '*What* a name! To handicap a fellow with a name like that makes me feel an idiot before her.'

The footman reappeared. 'Mr Ambrose's luggage has arrived, ma'am, but he wasn't on the train.'

'He has arrived, Hudson.'

Good Lord! Perhaps this was an old family servant—one who knew this Ambrose. Ronald looked coldly at the man, daring him to speak; but the servant's eyes expressed nothing. He looked from his mistress to her guest, and then approached Ronald.

'Your keys, sir,' he said deferentially.

Ronald mechanically felt in his pocket. He drew out his cigarette-case, and looked at it. 'Thanks. It'll do later,' he told the man.

'Very good, sir.' The man withdrew.

'Yes, how *did* you arrive before the train, dear?'

Yes, how *did* he? And by what merciful dispensation of Providence had the real Ambrose *not* arrived by the train? He looked across at his accomplice.

Duplicity is ingrained in women. They have always needed it.

'Yes, how did you come? You have not explained to us,' she said brightly. 'I remember you told me once that you had friends in this neighbourhood—a good many miles off, that is,' she added hastily. 'I thought perhaps——' She paused.

'That's it—the exact thing!' he replied with satisfaction. 'I walked over—I wanted exercise.' Then he suddenly saw a chance of giving her his references. 'As a matter of fact,' he said, looking at the girl as he spoke, 'I'm staying with Sir Malcolm Mackenzie at Gorm.' He had just time to see a flash of recognition of the name before he remembered his manners and turned to the elder of his hostesses. 'Perhaps you know him?' he asked her.

She shook her head with a deprecating smile. 'Oh no; I am a new-comer, you see. Hilda is the more likely—aren't you, Hilda darling?'

Now that was odd. But the lady left Hilda no time to reply. She laid a little hand on Ronald's arm and looked up in his face with wistful blue eyes. '*Staying*, did you say, Ambrose? Others before your own? Oh, Ambrose!'

'Sorry!' Ronald assured her; 'but—well, my host is lonely. He is an old man, and he wanted me before the shooting brings a crowd.' He was truthful by nature; and it was satisfactory when the truth was convenient. 'And I must get back to dinner, I'm afraid,' he added.

'But, *Ambrose*!—your *father*! What shall I say to him?'

'You won't be half so puzzled what to say to him as I should be!' he laughed.

'And your luggage has come. You must have meant to stay, dear. I may call you "dear"?'

'I prefer it to being called Ambrose! As to the luggage, that is why I told your man not to unpack it. It may be needed, or not. I can't tell.'

He looked across at Hilda. He felt he was doing uncommonly well. How absolutely lovely she was, with her little Greek nose and her Cupid-bow mouth, and her eyes so far apart, and the sun bringing out the gold hidden in her dark-brown hair! It was a joyous adventure. She could never go back on him now; they were accomplices.

The elder lady burst into tears. 'You won't come here—to stay. I see wha—what you mean—to your own fa-father's house, till—till you are sure of your—welcome! Oh, cruel——!'

Hilda had risen, and was standing behind the emotional little lady, with a restraining hand on one of the bowed and shaking shoulders. Ronald had risen too, feeling awkward.

'My welcome was—was more than I expected, or deserved!' he cried. Again he spoke the truth.

'*Mine*, yes!' The lady dabbed her eyes carefully. 'But did you come for *that*?—Oh Hilda, you cruel, hard-hearted girl!' Her tears choked her.

'Mamma,' said the girl—and her voice was very gentle, but rather authoritative—'you really must not do this. You know you promised me. If you behave like this, it will end everything.'

'I can't help it, Hilda! I'm not cold and sensible like you—but, at least, I can *love*! It is you, not I, that are coming between my beloved husband and our son—such a gallant, dear boy! You see him. How can you resist him?'

Ronald's blood rushed up into his head, turning his honest face the unbecoming colour of beetroot. He took a few hasty strides away. He looked helplessly round, and then at the distant hills. Now was his chance of escape; but did he want to escape? He looked back furtively. The lady was waving her arms in the air with a gesture as if shaking off all responsibility and repudiating Hilda; and then, dropping her handkerchief as she went, she tripped stumblingly up the steps, and fled through the window into the house.

VI.

Ronald returned slowly to the girl, and stood silent in front of her.

Hilda stooped and picked up the handkerchief the lady had dropped in her flight, and smoothed the lace border, without looking up.

'When does this Ambrose arrive?' Ronald asked, as they walked slowly across the veranda to a terrace that skirted a lawn at the side of the house.

'Not till to-morrow morning. He missed the train at the junction, and telegraphed. I opened it. I was bringing it to mamma when—I saw you.'

'Do you want him to arrive?'

'Oh, *no*!'

'Can I help?'

'I wonder!'

'I thought perhaps that was why you——'

'It is rather complicated,' murmured the girl.

'Very,' he agreed.

'Perhaps I might explain.'

'You might begin with Ambrose—that's me. What and who *is* he? If I am he, I ought to know.'

'Who *are* you?' she said.

'My name is Ronald Mackenzie. I'm a nephew of Sir Malcolm Mackenzie's. Do you know him?'

'My father did, I think.'

'Your father?'

'Yes. He is dead.'

'Then *my* father—I mean, Ambrose's father—who is coming home to dinner—isn't *your* father?'

'Certainly not!'

'I'm glad of that. And who is the lady who ki—I mean, who poured out the tea?'

'My stepmother.'

'And *my*—I mean, Ambrose's—mother? Surely not!'

'Oh *dear*, no!'

'Then are Ambrose and you—I mean, are you and I—we aren't brother and sister, are we?'

'Of course not.'

'*That's* good. What relations are we?'

'None.'

'*None?*' His voice sounded disappointed. 'But she called me her son.'

'You are *not*, I told you.'

'Then why on earth did she ki——?' Ronald paused. He never gave a woman away.

'She called you son, poor mamma, because you are her husband's son—I mean, Ambrose is—and she is so glad you have come. Oh, it is all very difficult to explain, and it is funny to you, but to *me*——'

'Don't tell me, if you'd rather not. And perhaps I'd better go.'

'Oh, you *mustn't*!'

'Then what am I to do to help you?'

'I have no right to ask you, a stranger.'

'I asked myself—to tea. Seriously, Miss—oh, please, may I ask you?—I haven't even the pleasure of knowing your name.'

'Hilda Middleton.'

'Do let me be of use, Miss Middleton.'

She regarded him thoughtfully.

'I'll do anything—short of opening Ambrose's portmanteau,' he told her encouragingly.

'You must make mamma give you a letter she has, addressed to Ambrose, and burn it.'

'But—oh, I say!' Ronald's face was abject in its misery.

They had left the terrace up and down which they had been pacing, had passed through a little gate at the end of it, and, skirting a field, had entered a narrow path running along the top of a bank of trees and flowering shrubs, at the bottom of which flowed a river. They reached a rustic wooden bench beneath a great beech-tree. Hilda sat down on the seat, her attitude one of despairing weariness, and Ronald stood in front of her, looking down at her.

'*You* could not do wrong,' he said presently, with conviction.

'Oh, it would not be wrong,' she answered, raising her eyes to his. She pulled her white skirt aside to make room for him beside her, and when he had taken his place, she began her story. Below them the river, half hidden by the trees, murmured an accompaniment to her soft voice.

(*Continued on page 314.*)

THE WATCHER OF THE SHIP.

By Bart Kennedy.

YOU look out for the land. But there is nothing save the line of the horizon: that sharp, clear circle in which you are enclosed as in a vast prison. A mighty, mysterious, immense prison; circled by a moveless, dread line; a line that is as the sign of the Infinite.

You are going over a world; a world of dread, mysterious darkness; a world wherein live beings of strangely ordered lives. You are going and going over their domain, that goes down and down and down into darkness—a domain bounded by a circle that breaks not, that always goes into itself, even as infinity.

The sun is up yonder. But it is not as the sun of the land. It seems as if robbed of its splendour. Ocean, circle, sun—it is as if the sun were the least of these three. It gives out a sense of being shorn of some of its light. Ocean, circle, sun. To you the circle is as the vastest; this mysterious symbol of the line going into the line; this symbol that is the sign-manual of God.

You are here alone. Alone on the look-out. You are the watcher of the ship that goes on its way over this dark world; this world that brings to you a fear as you look down into it. Surely is it that this ship is here but because of the tolerance of this dark, stupendous world. You feel that the waters of this world might arise at any time and engulf this ship.

On the look-out. Watching for the land that is out behind the circle that stretches round and round you. On the look-out. Waiting for the land to uprear itself—the land lying outside the circle.

Strange thoughts come to you as you watch—and fear. Fear comes to you as you look down into the waters. Is it to be that the ship shall arrive at its destination? Is it to be that the vast dark world shall decree that it be engulfed in its depths? Is it to be that the powers that sleep in this world—black and stupendous—shall arise? Is it to be that they shall grasp this ship, whereon you are watching, and drag it down and down into the depths? These questions come to you as you watch.

It is a long time now since you left the land; a long, long time. It is as if it were an eternity, a measureless space of time. At times it is to you as if you had never been on land, as if you had but seen it in some faint dream. Your memory of it is dim. The pictures of it have all but dissolved. Its great towns, its plains, its vast mountains—it is to you almost as if they had never been. It is to you as if you had always been going over this dark ocean world; always going towards the great, sharp, all-encircling line.

The bell of the ship sounds out, but you

heed it not. It is even as some faint ghost sound, some sound that belongs to a thing that is gone, that belongs to a thing that exists not.

At times you hear the voices of the ship; but they are as ghost voices. They are as the bell. You hear the sound of the ship as it cleaves its way through the waters; but it is as a sound that belongs to the deep darkness.

These sounds but bring out more clearly the surrounding silence—this tremendous silence of the darkness beneath and the line that encircles the vastness.

Lost. Lost in the unknowable. Will the time ever come when the land will rise over the horizon? Will the time ever come when the mighty prisoning circle will be broken? Will the time ever come when you will leave this world of darkness and awesome mystery, this world where live strange monsters that wait for the sinking of ships—monsters with dread peering eyes, beings of darkness and mystery that wait and wait far, far down in the gloom, beings of a world you know not?

The line! The line! Is it to be that it will ever break? Is it to be that the spell of it will ever dissolve? It holds all; it contains all. North, south, east, west. All are held within it. This line! This infinite prison. This surrounding, stupendous, circling fate. Is it to be that it will ever break?

You—the watcher of the ship—will it ever come that you will break forth from out this immeasurable prison? Will it ever come that you will reach the world from whence you came; the world of mountains and valleys and freshness and greenness; the world of the sounds and the voices of men?

How slowly goes the ship! It is almost as if it moved not. It is almost as if it were staying in one place. Surely it is not going. It is but a thing of stillness lying here on the waters. No, it moves. But it is as if it moved, and still, at the same time, kept in one place. It moves, but its movement is as a mockery. For the line is always there. The circling, moveless line.

Sun, waters, line.

You think of them as you watch from the eye of the ship. Sun, waters, line—to you it is as if you had never known aught but these three. All that you may have known before is but as the shadows of dreams. You knew them perhaps in some other life. You knew them perhaps in some vague life of shadows.

You, the watcher of the ship.

Something comes to you. There arises within you a surge of joy. Out yonder is the line. It is still as clear and as sharp as it was for the eternity of time through which it is to you as if you had been watching. Just as clear and sharp. But the joy within you grows and grows.

Now—the line has flickered. You look. You look steadily. And—yes, the line is softening. And your voice rings exultantly over the ship:

'Land ho! Land ho! Land ho!'

BEHIND THE LINES.

PART II.

'AT the end of each week,' continued Vignolles, 'we got sheets from the other bases, giving the prices they were paying in their area; and the private, who never said much, got out one of our own and placed it on my desk for signature. The first week these sheets came separately. But the second week the private waited. I suppose he waited; for, when the corporal had gone out, he placed them on my desk together. It was almost an invitation to make comparisons, and I began idly, till after a while it struck me that we were paying more dearly than anybody else.

'When the corporal came back I mentioned it, and he threw a look at the private.

'"I wouldn't trouble about these, sir," he said; "it's quite all right;" and when I asked for reasons, "This is a dear district," he answered. "They've got us here. Major Colgate always says so. Not enough competition. And, of course, it's the quantities that make the price. They don't tell us the quantities."

'It might easily be true, and one knew what these contractors and people were—all out to rob and make the most of their opportunity; but, still, I didn't quite see why vegetables should cost from fifteen to twenty per cent. more here than a few miles away.

'I ran into the adjutant in the depot that day, and mentioned it to him casually.

'"I shouldn't be surprised," he answered; and then he gave me his views about Major Colgate. They weren't exactly complimentary—and adjutants are pretty careful as a rule. But this one let himself go. "Says he's got no end of money—a big employer of labour—bought and sold things all his life, and no one's ever heard of him. The colonel believes him; I don't. He's what I call an opportunist. Strikes me he was out of a job and living on his wits when the war came."

'No doubt Colgate was the type that might impose upon a certain kind of regular soldier. In the civilian world they are often pretty helpless; and I dare say the colonel had listened to this man and had accepted his pretensions,

believing him to be a wealthy fellow whom one could trust, used to commerce, and quite capable of holding his own with a handful of French contractors.

'Now, I hadn't meant to take that job very seriously; I was only a stop-gap, and my heart was up the line. But once I started to doubt, I became a regular Sherlock Holmes. I couldn't get away from the meaning of those figures, and there was Cliffe handling the petty cash as though he owned it, and obstructing me in his obliging, and probably artful, way; and Monsieur Audibert, the interpreter, taking his commission on the small things, and possibly on the large as well; and the private, who said nothing and looked nothing, but who, I fancied, was now watching me, as much as to say, "Are you going to be in it as well, or are you going to keep out of it?" He, himself, was keeping out of it, I imagined.

'When once you begin to suspect things, you see certain other things in a new light. At one of the cafés in the place I had struck up an acquaintance with a couple of local gentlemen, business men I supposed they were, and in a fairly big way. To these I had mentioned that I was attached to the *Intendance*, as they call it, and was buying supplies locally for the British Army. They had not said anything, but they had exchanged glances. I remembered those glances now. And that evening I again visited the café where I had found them, and one of them was in his place.

'"I want you to be frank with me," I said, after an opening round of conversation.

'"In what respect?"

'"The *Intendance* of the British Army—what sort of a reputation has it in this town?"

'"You really want to know?"

'"Yes; I very much want to know."

'"Well, I will tell you. When Major Baker was here it stood very high, and was very competent; but the last six months with Major Colgate, we do not understand it. Or one can only suspect. It is difficult for honest people to deal with them. It is often so in our own army. I am not interested myself, but I have friends."

'"Thank you," I answered. It was enough. '"And may I exchange cards with you?" I added.

'"Certainly," said he.

'I'm afraid my card was nothing better than an addressed envelope.

'"'Vignolles'—you are French?" he asked, reading my name.

'"On my father's side, and distantly."

'That had aroused his interest.

'"If I want the names of the best firms here for certain articles, could you give them to me?" I asked.

'"I think so," said he. "I know several who did business with Major Baker."

'"Well, perhaps in a day or two I will pay you a visit;" and with that I changed the subject.

'Next day I went out in the car and called on our existing people. I had never met these except at the office when they came in for their money, and me they were rather apt to ignore, asking for Cliffe or the French interpreter.

'I began with our bran contractor, who also delivered some of our vegetables. I found her —she was a tall and rather good-looking widow— in a back-street, where she had a small shop with a sign that announced her as a dealer in thread, wools, and sewing-cottons. This puzzled me a little; but what puzzled me more was when I discovered that the bearded man who sold us yeast was by profession a piano tuner and repairer. The vegetable men, though they grew nothing themselves, really seemed to deal in vegetables. To each of these I suggested that they were making us pay too heavily. I mentioned the prices charged in other districts, and said that, unless they met us, we should have to make a change.

'"The major has never complained; but I will see what can be done," said the piano-tuner sulkily. The widow was more loquacious, offered me a green liqueur, and told me what trouble she had taken to get the enormous quantities we required, and the capital that was necessary. She had called on every miller in the district; the major and the interpreter had come with her in the car. She was an eloquent woman. The vegetable men said that with poorer qualities they could make lower prices. From these I went to the man who supplied us with live sheep on the hoof, for the Indian troops, who do their own killing. I couldn't find him, and had to give him up. I wrote to him from the office.

'The next day I sought out my French acquaintance of the café, and got him to give me a list of good addresses. It was he who told me that the piano-tuner was married to our interpreter's sister. The driver of the car had now become interested, and I found him chatting with Corporal Cliffe, who had been conferring with the standing contractors I had visited the day before. The interpreter, too, had seen them; and I now learned that prices had recently come down, and that they were all willing to make reductions.

'"Till Colgate comes back," I thought to myself; but aloud I said, "Well, that is good."

'The next day I called on some of the people whose names had been given me by my French acquaintance.

'I started with a real yeast merchant who was not a piano-tuner, a young fellow who had lost an arm early in the war, and who was very bitter.

'"When Major Baker was here, he dealt with me; but now this Major Colgate has changed

it," he cried. "He goes to a dirty civilian, an *embusqué*. It is for this that one loses an arm!"

'His price had been satisfactory. We were paying twenty per cent. more than he had charged, and he was still ready to supply us on the old terms. "When Major Baker was here," he repeated—"that was a man! What must one think of the English when they treat in this fashion a soldier who has done his duty?" He was an excitable chap, and he had cause to be.

'At the largest vegetable-grower's of the district, a Monsieur Popinot, by an odd coincidence I found Major Baker himself.

'"Excuse me," he said, "if I'm poaching on your territory; but you seem to have no use for Popinot, and as I'm buying for the next district, I thought it a pity to waste him. I don't quite understand it. Popinot showed me a letter written by your Major Colgate, giving him notice. He said he could buy better and cheaper elsewhere. He can't. I'll guarantee that."

'I wondered whether Popinot still had the letter, and whether he would lend it me, or let me take a copy. He was willing enough. He didn't care. He was a rough man in a blouse, one of those French peasants who are worth thousands, and whose heart is in their gardens and the work they do outdoors.

'We found the original letter, and he made me a present of it; and then I asked Baker, who seemed one of the best, whether he had really dealt with the yeast merchant who had lost an arm? He had. "A very brave fellow, and straight and reliable," he said. "You don't mean to say you've chucked him?"

'I did mean to say it.

'"And what are you paying?"

'I told him, and how the piano-tuner, who was also a yeast merchant and Monsieur Audibert's brother-in-law, had come to terms.

'"Looks a bit queer. But it's none of my business. Audibert's a curiosity; seems to think the war's on for his special benefit. He'd be in the infantry if we had no use for him. I used to threaten him. It kept him quiet;" and Baker rose and made for his car, that stood with mine outside. "I'll go on poaching," he cried as he drove off.

'I went back to the one-armed yeast merchant after that, and asked him if he, too, had received a letter from Major Colgate saying that the British Army could buy more cheaply elsewhere. He had, and he had preserved it. I made a copy, and thanked him.

'It was the same with the bran; it was the same with the live-sheep dealer. Colgate had written himself down a liar, if nothing worse. He was probably at the back of the widow, at the back of the piano-tuner, and was no doubt standing-in with everybody else. We were paying fifteen to twenty per cent. above the market rates for practically everything we touched. Our yearly turnover was close upon two hundred thousand pounds. Joffre, French, and the Kaiser together weren't doing as well out of the war as Major Colgate, though they had a trifle more responsibility. I was rather in a rage when I got back to the office and found the corporal and the interpreter in consultation; and the corporal hadn't improved matters by forging my name to a voucher which said that we had received so much clover from somebody. He had often done the same for Major Colgate, he prevaricated. It saved trouble.

'With the exception of the private, they were disturbed and rattled. They had lost their nerve somewhat, and one of them went out to interview the driver of the car as soon as we returned. They wanted to know where I had been, and what I was up to. They felt that they couldn't last much longer if the major didn't come back and chase me away. It was exactly like living in a wild detective story, where every one is a liar, and trying to throw you off the scent. And when I had done with the corporal and Audibert, I turned to the private, and we looked up the prices we were paying for yeast, bran, and vegetables at the time the major's letters had been written, when he had stood the old contractors off and taken the new ones on. We found the date and the prices. The old contractors were ever so much cheaper than the new, and the yeast was exactly the same yeast, with the same trade-mark; and Popinot could hardly be beaten for potatoes, carrots, leeks, and other vegetables. The private said nothing, but I have a notion that he had concluded I was honest.

'Though my natural inclination is to sit in a trance and admire the wonders of the universe, when I do get going and steam up, I'm about as wide awake as most people. On the Sunday afternoon, with everybody away, I went down to the office and set to work on my report. The colonel should have it that very evening. I had all the evidence that was needed, and I couldn't well look into anybody's bank-account. I was hot and angry and determined, and I knew I must get the report in early, before the major could queer it. If he were there, I could not communicate with the colonel without my communication first passing through his hands. I must get this out before he came back; and now, warned and alarmed, as he had doubtless been by his confederates, he might turn up at any moment. The operation he had undergone was not a very serious one.

'I was rather in a rage. For here were these men, safe and snug at a base, sleeping in beds and getting their four regular meals, and it was now quite certain that, from the major downwards, leaving out that silent private, they were doing their best to make us lose the war.

'That was the way I looked at it. It didn't so much matter that they were rogues and

thieves and humbugs, but that fact did matter. They were on the enemy's side—that's what it amounted to—working against us from within.

'I was as brief as possible. I put the proper figures and the figures we were paying in two parallel columns. I mentioned that Major Baker's contractors, all genuine people, had been dismissed, and that we were now dealing with men of straw. I said that they had climbed down in a body when I faced them, but that they would go up again on Major Colgate's return. I enclosed copies of the letters he had written, and traversed these with the true facts of the case. I said that I had no confidence in anybody in the office, with the one exception of the private. I reckoned the difference between what we were paying and what we ought to pay at thirty thousand pounds a year. When I was done I made three copies on a duplicating-machine, and I was addressing the original to the colonel, when who should come in but Colgate himself, red, flustered, and uneasy! I did not rise as he entered.

'"Alone?" he began. "You're a worker. What have you been up to now?"

'"Are you out of hospital," I asked, "or are you going back?" I had no respect for him. His rank was nothing to me. I treated him like the dog he was throughout that interview.

'"I'm out," he said, "and you're getting out to-morrow."

'"Then I was just in time," I answered. And I picked up a pencil, fixed a sheet of carbon-paper, and wrote a covering note addressed to him and asking him to pass my report on to the colonel. By the regulations he had to do it; but he would have first say. Or he might not do it, especially with me leaving.

'When I was done, I handed him his letter and my report. He looked them through, and his face grew more red.

'"You know what this means?" he asked. "You must be mad!" And then, "It's simply ridiculous—a man in my position—money—as though I wanted money! We may have been a bit careless," he conceded; "but in my position—a big employer—it's perfectly ridiculous!" And he tossed the papers on to the desk. "What shall I do with these?" he asked. "Burn them?"

'"I've three more copies," I said.

'"Look here, Vignolles," he answered; "I'm a major, and you're only a one-pip subaltern. This isn't going to go through."

'"Oh yes, it is," I corrected him; "you've got to. It'll have to go through you, but you've got to pass it on."

'He seemed rather relieved at that.

'"How did you get hold of those letters?" he asked. "They're merely business letters, and don't mean anything."

'"No?" said I, for I knew that he was lying.

'My quiet frightened him. If I had got up and talked, he would have talked back; but icy, contemptuous, not to be turned, I only looked at him. It was disgusting to sit there, me a second-loot, and, metaphorically, spit upon his rank and uniform.

'"I say," he resumed at last, "is there anything I could do—a week's leave in England? I could work it for you."

'"If I want leave, I'll get it from my own unit, and not from this institution," I said coldly.

'He tried one more bluff before he was done with me.

'"Every man has his price," he said; "what's yours?"

'"I'm rather keen on winning the war," I answered. "If there's anything you can do to help that along—but you and your friends are getting in the way. That's why you're going to be kicked out. And you've rather rolled our name in the mud in this place, haven't you?" I added, rising. "But you're not likely to worry about that."

'"All right," he answered savagely; "all right. There's nothing more for you to do here. You'll report to the adjutant to-morrow morning."

'"Yes, I suppose I'm finished. You'll pass that on to the colonel; or, if you like, I'll buzz in one of my own copies. You're not here officially yet, are you? There's nothing about you in orders."

'He winced at that.

'"I'll pass it on," he said. But as I didn't believe him, I passed on a copy myself that very evening to make sure.

'Next morning early I had a written order to report back to the adjutant. It found me in my room at the hotel. I walked down to the depot. My car days were over. The adjutant received me with a question.

'"You've rather upset the old man," he said. "He was in his office last evening; and you're to pack up and be off to where you came from—the sooner the better, he says. What have you been up to?"

'"Ask Colgate."

'"He's back all right."

'I looked on the wall, and Colgate hadn't wasted time, it seemed; for there hung this morning's orders, and I saw "Returned to Duty," and the first name on the list was "Major E. P. Colgate." Below this was a brief notice—I read it aloud—which told us that, for stealing a tin of condensed milk in the depot, a certain private had been sentenced to one year's hard labour. It was pretty ironic.

'"What's Colgate getting?" I asked, for now I was fairly roused, and didn't care who knew it.

'"He'll be caught in time," said the adjutant.

'"He's caught now." And then I let fly utterly. "He's a thief and a liar—been robbing

the army these six months. I can prove it. I've reported it. Here's a copy for you;" and I gave him one of the couple I still had over.

'The adjutant whistled. He was rather alarmed. "This is confidential," he said hurriedly. "I don't want to be mixed up in it." And then, more coolly, "They haven't treated you very well," he added. "Look in and report before you go. This afternoon, eh? The old man wants me to telephone—rather glad to see you out of the way."

'"All right," I answered, more sick and more savage than ever. For I felt I'd done my duty, had even earned a word or two of praise; and to be treated like this, as though *I* were the criminal—it hurt.

'I'd left a few things at the office, including a pipe or two I valued. I went in for the last time, and there my enemies sat in a serried row—the corporal, the interpreter, and the major. They looked at me as though they had won a victory, as though they had downed me—every one of them.

'I found the things I'd come for. The private made them up into a parcel for me; and as I turned to go, "Oh, Vignolles, I saw the colonel," drawled Colgate. "I explained matters to him. You took a bad knock up the line, didn't you? Concussion? Makes a man a bit queer in his head at times, eh? I explained all that to him, and he understands it. He's overlooking that unfortunate report."

'The blighter had me every way, if the colonel played up to him, so there was no answer; and in that moment I felt that there wasn't much to choose between him and his precious chief. The colonel was getting rid of me to demolish the evidence. I was one of those inconvenient people who know too much.

'It was no good arguing, and I went my way. And there it ended, or it looked like ending. I was pretty bitter about it for several weeks, till one day, not so very much later, as I was looking through a *Gazette*, I found that a Major E. P. Colgate of the Army Service Corps had "relinquished his commission"; which meant that he'd been asked to leave and there was no refusing. I felt then that, whatever my subsequent history, I should have earned every penny I drew in pay, and a bit over.

'I'd more or less gone past it all, till, only a few months back, I ran into that never-to-be-forgotten adjutant. It was at a rest-camp in France. He was a major now, and I a captain, and he remembered me. Naturally I spoke about the supply depot, about Colgate and the colonel. "I was rather sore," I ended. "You people hardly played the game."

'"The colonel's a Regular," he said; "what was he to do? He'd let the fellow carry on for six months, and he'd be held responsible. He was overworked and worried, and it was his bread-and-butter and his wife's and four youngsters'. He'd trusted Colgate, who had let him down. So you were best out of the way; he didn't want any fuss. But it went off quietly. He looked into it, and Mr Colgate had to go—quietly. They all had to go. He shoved a new man in with orders to clean up. You'd really made a pretty thorough job of it, it seemed."

'"Colgate got off fairly easy, then?"

'"Not quite. He was kicked out, wasn't he? That didn't do him any good. And he was young enough to be collared after he'd been kicked out. Went in one door a major, and came out of another a private, so to speak. I don't think he'd enjoy that—'a big employer of labour—must set an example.'" The adjutant imitated him to the life. "He'd set more of an example than he'd bargained for. And there was that little interpreter, too. He got sent back to the French Army with a pretty rotten report. Hope he's alive to-day. He probably isn't. The corporal lost his stripes, and went up the line with a couple of mules."

'So that was how it had ended? I was hot about it, confoundedly hot about it for a season, hotter than I'd ever been before. These things aren't written up. Yet they hold most of the drama, the real drama, that goes on in a war—more exciting and more sustained than the fighting. But you've got to go behind the lines to look for it.' He stopped here and gave a little shudder. 'By Jove, it's turning cold again!' he added.

The sun had gone down in the west, in a flush of pink and rose, and we, from our perch on the edge of a park, were looking out upon a valley fast losing itself in shadow. The rabbits nibbled around us, unafraid; the cock-pheasants were calling; an owl was circling overhead. And looking out upon it all, upon this wide landscape, so full and so secure, Vignolles, who was about to go from us, stretched and shook himself, and sprang to his feet and gazed upon it, darkling. And then, 'England's a good country—the very best,' he said; 'but there are far too many Colgates running wild in it. I can't compete with them. I never could.'

We climbed the stile and found the lane, and so downhill till we came to the railway station. And that was the last day out I had with my friend Vignolles, till he turned up again, resolved to stay, the following year.

THE END.

A LOVER OF MEN.

No more I'll tread the desert path,
Where men ne'er congregate;
Nor haunt the lonely shore that hath
For me no kindred mate.
But I shall seek the broad highway,
And share my humble store
With those who dedicate each day
To love for man, the more.

THE HOME CALL.

By BERNARD W. HENDERSON, D.Litt.

PART I.

I.

THE Boy Scout patrol climbed up resolutely out of the steaming-hot Welsh valley towards the mountain-ridge. Their packs were heavy, their knees scratched by the briery undergrowth through which they forced their way. They had started from the friendly little inn at Tal-y-Llyn too late after breakfast, and the midday August sun found them still struggling with the lower slopes. They were thirsty, tired, dishevelled. But it was their summer holiday, now ending, and they were out to climb the giant mountain as a last achievement. The six boys pressed upwards doggedly.

Presently the woods and undergrowth opened out on to a gentler, open rise of tussocky coarse grass. A mountain-stream came rushing down a quarter of a mile away on their right. The semicircle of the ridge in front looked at last certainly nearer. In another half-mile the boys topped the low ridge in front, which had hitherto hindered a complete view of their mountain.

There, in front of them, the ground sloped gently down to a hollow, in which the waters of a circular tarn lay spread out invitingly before them, sparkling in the sunshine. Out of its farther shores, girdling these round with a huge, black precipitous wall of crags, towering eight hundred feet or more above its level, rose the semicircle of the mountain-ridge, in places, it seemed, all but overhanging the water.

The boys shouted for joy. Never in all that last wonderful week had a more welcome sight met their gaze. Down the slope they raced, their packs jumping wildly on their backs, till they reached the low bank, at the margin of the tarn, which sank down steeply into the clear green water—water so clear that every rock, every pebble, could be seen a score of yards out from the shore. Away went packs and hats, boots, stockings, clothes, and the whole six leapt into the water.

They emerged in a moment, shouting, laughing, gasping, and made for the bank again. That delicious-looking water on that hottest of days was—well, ice wasn't in it for cold. Only two dared a second plunge. Then all scrambled for their packs, tore them open, and a vigorous towelling followed.

That was the best part of the day, surely. The sun shone bravely. The grassy bank was as warm as blankets. The tarn was 'just ripping' to look at. Towels were spread out to dry. Lunch-packets were opened. Any one tramping along the edge of the ridge far above the tarn would have seen the white figures of the naked boys spread picturesquely about the grass in various attitudes, like small white dots on a green field. An hour passed away in sheer idle delight.

At their leader's word the boys reluctantly donned clothes and packs again. Skirting the edge of the tarn, they made for a break in the ridge, where a rock-strewn slope of the steepest kind gave them their one chance of ascent. Up it they clambered in a bee-line, hauling on rocks and heathery tufts, and emerged victoriously on the crest where came up on the left the beaten track which wound deviously down to the inn and the lake in the valley. The rest was easy. In a quarter of an hour the boys stood on the cairn which crowned the top of Cader.

Before them lay stretched out ridge after ridge, and peak upon peak of a wonderful new country rose. Far away to their left glittered the sea. Over the whole there floated soft, slow, white fleecy clouds in the blue, some of them from time to time catching on the higher mountain-tops, and streaming out from them like white pennants.

Had the boys been more weather-wise they would have hastened their descent into the deep valley to the north, whither they were bound. But they lingered on the top, glorying in their climb, studying map and compass, revelling in the view. And the clouds sailed inland from the sea, ever more thickly and more fleecily. A mist began to writhe upwards towards them from their valley of that morning. The sun appeared less bright as it sank towards the west, and a veil as of transparent gauze seemed to be drawn, interposing beneath it and the earth. On the more distant heights the white clouds had now settled closely, and were spreading downwards, almost, as it were, greedily devouring them from sight.

 [*All Rights Reserved.*]

The leader at last gave the order. In Indian file the patrol clambered down the steep, stony track. Hardly had they left the top when the mist silently seized it. They had left it just in time, but not the menace of the mountain.

Soon one of the six fell behind the rest. The never-ending descent tried him far more sorely than had all the upward climb. His foot was very sore. He must, he thought, have cut it on a rock in his bathe in the tarn. Of course, you didn't feel that kind of thing at first. But he had a roller bandage in his pack. He sat down on a rock and proceeded to take his boot off. The others rounded a projecting corner, not noticing, and disappeared from view. No matter! He would overtake them in a jiffy. His special chum, Lance, would, he knew, be sure to wait for him. There was his boot-lace in a knot, of course. He could swear he hadn't tied it up like that. Never do to cut it, though.

The boy wrestled with his lace, till after some minutes it yielded. Off came boot and stocking. Yes, there was a nasty rub, and his foot would need a bandage. Where was his pack? And the first-aid tin? At the bottom of the pack, of course. His whole attention was engrossed. The minutes sped. At last stocking and boot were on again, things back in the pack, pack fastened. He stood up. Where was he? And what had happened?

Thick folds of mist rolling down from the mountain-top behind him were wrapping him round. He could see barely a yard or two. Every minute the mist grew thicker. Where were the others? He would whistle to Lance.

On his whistle he blew with all his might a peculiar call. No answer. Then again. The same call sounded from below. Then up through the mist came another boy at top-speed.

'Come *on*, Jim,' cried the new-comer. 'Lucky I heard your call—our "Home Call." I thought I couldn't miss that. Just look at the old fog, though. The rest are a mile on by now. We must do a bit of a sprint.'

II.

The two boys started fast down the path again, Jim limping slightly. The mist circled in eddies round them. The path lost itself in a swamp. They splashed through it.

'Don't remember that coming up to Jim,' muttered the other boy.

Beyond the marsh there was no trace of the path.

'Never mind, Jim,' he said; 'we shall pick it up again lower down. It winds a bit just here. No good going back to look for it.'

The mist was turning to cold rain. The boys' bare knees shone wet and glistening red. Jerseys, shirts, shorts, were soon soaked through. The descent was rocky and alarmingly steep. They had to go dead-slow now.

Suddenly the ground dropped away well-nigh sheer in front of the boys. They were forced to skirt upwards to the left a bit. A dash of water spirted in their faces, and a mountain-stream leapt at them out of the mist like a small wild beast, and then plunged out of sight into the misty hollow on their right.

For the best part of an hour the two boys pushed blindly on along the mountain-side, slipping, stumbling, jumping, falling. Ever and again a torrent came dashing down on their left, and had to be crossed on the slope, where the slippery stones gave way under their tired feet. Now a great downfall of screes, which spread out fanwise to the depths below, checked their course. A step or two on it sent a small avalanche of boulders rolling down out of sight with a hideous clatter, and, their hearts in their mouths, the boys struck slantingly upwards over the screes till they reached the dripping sods again beyond the fall of rocks. Their boots squelched out water at every step. Water poured from their limp hat-brims, ran in streams down their necks, dripped from their elbows, flowed down them within their shirts ceaselessly. Their sodden shorts chafed at every step the inside of their knees. There was no dry inch either within their packs or on their bodies.

At last Jim, the younger of the two, sat down on a jutting rock. 'It's no good, Lance,' he said, half-sobbing; 'I'm just about done. My foot is frightfully sore, too.'

The elder boy, some fifteen years of age, looked at his chum perplexedly, then peered down blankly into the mist. 'Can't see a yard,' he muttered. 'Try a shout, Jim,' he said.

The two shouted together out into the mist. It came in yet a thicker wave round them, as if in mockery. They shouted again.

'Can you get on my back, Jim?' suggested his chum doubtfully.

'Top of the pack?' the other answered, trying to laugh. 'I *don't* think.'

'But we can't stay here all night,' objected the older boy in despair. 'We'd be frozen stiff by morning.'

'You push on, Lance,' said Jim, 'and let me rest here a bit.'

'Likely, isn't it?' was the reply. 'One more shout! I believe I heard something just now.'

To the third shout, which rang echoing along the mountain-side, there came an answering bark. A shape, which seemed huge in the mist, came leaping towards the boys, barking furiously. A collie circled round them, then darted off into the mist in answer to a whistle. A large figure approached—a man, tall, strong, with grizzled beard and broad, grave brow, a shepherd's plaid on his shoulders.

'Lucky Don heard you, my lads,' said he. 'It is not weather for a bivouac, and the day hasn't far to go. One of you damaged, is he?'

Jim struggled to his feet. 'It's quite all

right now you 've come, sir,' he said, and limped forward a pace or two.

The man smiled grimly, picked the wet boy up in his arms, wrapped him in his plaid, and strode off, carrying him as if he had been a child. Lance followed, the dog racing on in front silently till his bushy tail disappeared in the mist.

III.

In a short while a rough wall sprang into view out of the mist, then the outline of a cottage. The man strode into the house, and deposited Jim on a chair. Then he kicked the smouldering peats on the hearth together and piled others on. A blaze sprang up at once.

'Off with every stitch of clothing you have on, boys,' he said. 'It will take all night to dry. And you won't be going farther *this* evening, I warrant.'

The boys stripped, and soon, each wrapped in a blanket, snuggled down close over the peat-fire, which was crackling merrily, a steaming cup of cocoa and a chunk of bread by each. The shepherd lay back in a large wooden chair, gravely smoking and regarding them.

'You 'll be the younger by a year, I reckon,' he said to Jim. For a moment his glance wandered to a photograph on the rough mantelpiece. 'But you have both come through it all right,' he went on. 'Ay, but it 's an ill mountain this for mist and crags. You may thank Heaven in your prayers this night that Don heard you shouting.'

'Will the mist last all night, sir?' asked Lance.

'No,' he answered; 'this rising wind will chase it away by moonrise.'

For the first time the boys noticed the moaning of the wind round the cottage. They drew in still closer to the fire, as if to escape the eerie sound, and the shepherd piled more peats on.

'Ay,' he continued, 'this summer mist is unchancy. Things happen in it.'

Jim was nodding drowsily with the heat. But Lance was wide awake in a moment.

'What things, sir?' he asked.

'You are scholars, boys, aren't you?' said the shepherd. 'Do you mind your Vergil, when the poor queen goes distraught with love for the craven skunk who deserts her? Ay, that 's my bible here,' he added, noting how the surprised boy's look had wandered to a book on the table, labelled—yes, Lance *had* read the title right—*Vergilii Carmina.*

'Were you at a public school, sir?' stammered the boy confusedly. 'Vergil is jolly stiff, don't you think? What is your name, sir, if you don't mind me asking? Mine is Lancelot Hedden, and I 'm at Marlborough. So is Jim here—Jim Ranold.—Wake up, Jim!'

'Let Jim sleep,' said the man. 'As for me, suppose you call me Mr Dass—Mr Purun Dass,' he said, his eyes twinkling; but the boy failed to catch his meaning. 'Yes, Sedbergh and Trinity, Oxford, once on a while—but that 's neither here nor there.

'How do I come to be here then, you wonder?' he continued, answering the boy's unspoken question. 'Are you mountain-born, Hedden, or was your father before you? No? Then you won't hear the call of the hills at the end of life. But, man alive! *if* once you heard it——'

He relapsed into silence. Jim was quite sound asleep. The man picked him up as gently as a woman, and placed him in his blanket on a plain couch which ran along the side of the room near the fire, wrapping his dried plaid round the boy's bare legs. Then he took his own seat again. Evening was deepening into night, and the shadows on the walls, cast by the red spurts of flame darting at times out of the glowing peat, glanced queerly. Lance returned to the attack.

'What things in the mist, sir?' he ventured.

'You won't be scared?' asked the other. 'Well, remember, you are safe enough here.'

He paused a moment. The boy sat up, with an eager thrill of half-pleasurable, half-alarmed excitement.

'Living for years all alone here,' began the man, 'I believe I see rather more than most folk. I 'm half-Scottish, you know. Perhaps that 's the reason. Not that my name is a Scottish one,' he added hastily.

'Well, just a year since there was a bad crime down in the village yonder. I knew nothing of it up here. Blowing hard it was that night, and the mist driving all the while by the window. On a sudden I heard steps outside, and went to the door and opened it. I just saw the figure of a man rushing past up the mountain. Half-mad he seemed with terror, the rain streaming off him, and the gale blowing his long hair right back out beyond his shoulders. Before I could hail him he was away in the mist up yonder.

'I was for going after him, for the crags over the tarn aren't so far away, when my feet were stayed on the very door-sill. Through the mist, but without a sound this time, there came following after him two shapes—great long skinny arms and hands stretched out in front of them, gripping at the air. There was a cruel, red glint gleaming in the eye of them. Do you mind your Vergil, lad?

Armatam facibus matrem et serpentibus atris.

'Wraiths of the mist? Perhaps so. By my door they went, soundless; but the shine of the nails and the fire of the red eyes——

'That 's enough of *that* story,' he broke off, 'and I ought not to have gone so far. But I 've had not a soul I wanted to tell it to before now,' he added, half-apologetically.

'But the man, sir?' queried the eager boy.

'I picked him up with his neck broken at

the foot of the crags at the tarn's edge next morning,' said the shepherd reluctantly. 'They were hunting for him in the village all that night. Yet, I misdoubt me, worse than man's vengeance overtook him.'

A blast of wind shook the door. The man rose and fastened the long bar firmly in its place; then he closed the shutter over the window.

'Ay, an unchancy thing is the summer mist,' he repeated, half to himself. 'And who knows what happens in the heart of the hills? But you are safe enough here, the pair of you,' he continued. 'Say your prayers at even and give thanks, and nought will touch you. Now take your chum to bed up the stairs yonder, and I'll wake you in the morn. Nay, many a time ere now I've slept for choice on the couch here,' he added, seeing the boy's doubtful looks.

'Thanks very much, sir,' answered Lance. 'Now, Jim, up you get!—Good-night, sir.'

The two boys, blanket-girt, vanished up the stairs.

In the room below the man quietly opened the shutter and gazed out on the night, now clear and moonlit. 'A fine pair of lads,' he murmured. 'Ah, Janet, you never come by here, you and the boys.'

He closed the shutter and lay down on the couch. The peats smouldered dully. The wind went gently wailing round the cottage.

The sleeper tossed uneasily. 'Twice more,' he muttered; 'on water once, and once on land. So comes the Call, and Heaven's mercy on the lads thereafter.'

Upstairs the boys slept soundly, the elder's bare arm flung protectingly over his chum.

(*Continued on page 333.*)

NEVIS, THE ISLAND OF THE SNOWS.

By Rev. MONTAGUE L. FOYLE.

THE title is an absolute misnomer. It would seem fairly safe to venture the opinion that in latitude 17° north and longitude 63° west, with no part of the island exceeding an altitude of 3600 feet above the level of the Caribbean Sea, snow never has fallen, and never will. But it is supposed that when, in 1493, Columbus approached the island for the first time the single surmounting volcanic cone was in activity, and that the white smoke surrounding the summit suggested to him the idea of snow. Even at the present day travellers approaching Nevis are frequently charmed with the beautiful fleecy clouds around the top of the mountain, which give to it much the same appearance as it presented to Columbus over four hundred years ago. So the explorer named his discovery Nievies, from its likeness to a snow-capped peak near Barcelona; the name was subsequently abbreviated to Mevis, and then to its present form. It is interesting to recall that the name of the adjacent island of Montserrat was likewise derived from a mountain-peak near the same Spanish port.

For over one hundred years after the date of discovery Nevis appears to have remained in a state of primitive wilderness. The only reference we seem to have during that period is that of a certain Captain John Smith, who wrote in 1629: 'In this little Ile of Mevis more than twenty years agoe, I have remained a good time together to wood and water and refresh my men.' The island is, however, separated from the sister-island of St Kitts only by a narrow channel, three miles wide, so that with the opening up of the latter island by Sir Thomas Warner in 1623 the occupation of Nevis became almost inevitable. A great fillip was, moreover, given to West Indian development by the action of Charles I., who, under the Great Seal of England, granted by letters-patent (dated June 2, 1627) the right over all the Caribbean Islands, including Barbados, to James Hay, Earl of Carlisle. This grant was opposed by the Earl of Marlborough on the ground of priority of right, but the dispute between these noble lords was compromised by the former undertaking to pay the latter and his heirs £300 a year. The sum is an interesting side-light upon the value set in those days upon things West Indian. It does not seem likely, however, that the Earl of Carlisle played any important part in the opening up of Nevis; the credit must be accorded to Warner and his pioneers. In 1628, it is reported, 'At last they came to Mevis, a little Ile by St Christopher's, where they seated themselves and were well furnished with all necessaries.' The first impressions of these intrepid adventurers must have been favourable.

Despite trouble the following year from the Spanish Fleet, consisting of thirty-five large galleons and fourteen armed merchantmen, and commanded by Don Frederigo de Toledo, the infant colony, from the fragmentary records that have come down to us, seems to have been uniformly successful. This was due in part to the wonderful fertility of the soil and the wise management of Sir Thomas Warner. Especial praise must, however, be given to the fostering care of his successor, Governor Lake. This gentleman is stated to have fixed his house in the vicinity of the capital, and to have exercised a beneficial influence on all with whom he came in contact. He is described as 'a wise man who feared the Lord.' Under his administration, writes another, 'Nevis rose to opulence

and importance; it flourished beyond expectation. Within the short space of twelve years from the date of settlement the productions of the island had become an object of national importance, and it was regarded in England as a fruitful and valuable little colony.' The population in 1640 is stated to have been 4000 whites and 12,000 blacks, 'so powerfully' (the writer adds) 'are mankind invited by the advantage of a mild and equitable system of government.' One wishes that more were known about a certain John Hilton, who held the offices of storekeeper and chief gunner of Nevis, and seems to have been a trusty friend of both Warner and Lake. But in common with so many of the West Indian Islands, Nevis was soon overtaken by disaster. In 1689 a dreadful epidemic swept away half of the inhabitants; whilst in 1706, the year of Marlborough's great victory at Ramillies, the French with five sail of the line and twenty smaller vessels descended from Martinique. The Nevitians were unable to offer any effective resistance, and three thousand slaves were carried away as booty. The present estate of Morning Star is supposed to have derived its name from a battle fought at dawn upon that spot between the local militia and an invading French force. The next year saw a devastating hurricane, accompanied by earthquake. The sea is stated to have overflown the land by half a mile, and three hundred lives were lost. But a grant of £103,000 from the Home Government helped to put the island once again on its feet. In the middle of the eighteenth century it had the name of being better cultivated than most of the West Indian colonies, and the planters were described as being exemplary in the treatment of their slaves. In 1782, during the siege of Brimstone Hill, St Kitts, by the French, Nevis was once more attacked by the foe. The story of the downfall of De Grasse, first by being beaten in Basseterre roadstead by Admiral Hood, and then by encountering the combined fleets of Rodney and Hood in the Battle of the Saints between Guadeloupe and Dominica, belongs to our best naval traditions. Lord Sandwich, who was in charge of the Admiralty at the time, sent Rodney forth with the words, 'The fate of the Empire is in your hands, and I have no wish that it should be in any other.' The Peace of Versailles in 1783 saw the British in a position to dictate terms to a beaten foe. Nevis was claimed for King George III., and British it has remained ever since.

A considerable part of the prosperity of the island must be ascribed to the famous mineral spring, which is evidently of volcanic origin, and whose waters are said to resemble those of Wildbad in Württemberg. As one stands before the present Bath House Hotel, situated about half a mile from Charlestown, the capital of Nevis, or wanders along beside the hot stream that still winds its way from the mountain to the sea, there comes a sense of a direct link with the past. Two hundred and fifty years ago the traveller Blome reported that the spring, the temperature of which he found to be 100° F., was 'much frequented for the curing of the several distempers of the body of man.' Stories are current of a negro boy who, after bathing in the warm water, was cured of leprosy; whilst another sufferer is stated to have become 'as nimble as a mountebank or tumbler after he had dipped himself therein.' 'Indeed, all distempered people, both Whites and Blacks, find great relief by it'—thus writes another in praise of the waters which had benefited him so greatly. It is not very difficult to imagine how the fame of the spring would spread far and wide, and how, during the eighteenth century, schooner after schooner would bring its quota of rank and fashion, till Nevis became a kind of tropical Tunbridge Wells or Bath; and one can also quite easily carry the imagination a little farther and picture as happening there, by the banks of the famous spring, scenes such as are depicted by Thackeray in the *Virginians*. So much did the inhabitants appreciate the waters as the source of their prosperity that they engraved on the first issue of their postage-stamps, in 1861, a picture of a goblet of the health-giving fluid being handed to one prostrated by sickness. The engraving still appears on certain present-day values of the stamps of the combined presidency of St Kitts-Nevis, a new issue of which recently appeared. During the past few years visitors to the waters have not been many; the steamerless condition of Nevis during practically all the war had the effect of keeping away such as might have come. Invalids, as a rule, were not willing to risk the journey by barge from the town of Basseterre, St Kitts. So the island awaits the day of the revival of its erstwhile glorious bath-house.

Probably 1787 is the most outstanding date in the island's history, for it was in that year, on March 11th, that Captain (afterwards Lord) Nelson was married in Montpelier House, Fig Tree Parish, in which church the register entry can still be seen. Even after over one hundred and thirty-five years the record is easily decipherable. 'March 11, 1787, Horatio Nelson, Captain of His Majesty's ship the *Boreas*, to Frances Herbert Nisbet, Widow.' At that time the captain was on the Leeward Islands station, with headquarters at English Harbour, Antigua, only twenty miles' sail from the island where his fiancée dwelt. His naval life at the time was probably not of the happiest. 'English Harbour I hate the sight of; it is a vile hole'—thus the subsequently famous victor of the Nile and Trafalgar is reported to have written. His dislike was doubtless due to the bad feeling engendered by his determination to enforce the

Navigation Act, which forbade direct intercourse with the newly independent United States. In those days, as in these, the question of commerce between the West Indies and America was one of vital importance, and Nelson was hard put to it to enforce what may have been a very necessary, yet nevertheless was in the West Indies a much-resented, law. But in Nevis he found consolation and solace, and there our great naval hero passed what were probably some of the most happy and peaceful years of his troubled life. The bride was only twenty-three, and had been for eighteen months widowed. She had one little son at the time of her second marriage—few of us have ever regarded Nelson in the light of a stepfather. The best man at the wedding was the Duke of Clarence, who afterwards ascended the throne as William IV., and who at the time was on terms of closest intimacy with the bridegroom. The house belonged to the uncle of the lady, and of the original building only the ruined walls and gateway remain. Quite recently it was the privilege of the writer to read the very durable and suitable inscription that has been placed thereon: 'On this site stood Montpelier House, wherein, on the 11th of March 1787, Horatio Nelson of immortal memory, then captain of the *Boreas*, was married to Frances Herbert Nisbet.' The ruin stands in a most delightfully beautiful situation, and one can imagine the great hero enjoying the charming view to be obtained of St Kitts, with the then important and troublesome Dutch islands of St Eustatius and Saba in the background. Nevis also has the distinction of being the birthplace of Alexander Hamilton, who became second in command to Washington during the War of Independence, and who, after taking part in the various conventions which led to the framing of the Constitution of the United States, became the first Secretary of her Treasury. The present Hamilton House on the sea-front at Charlestown is supposed to have been erected on the site of the building in which he was born, and as such has been the scene of innumerable visits from American tourists.

Nevis to-day is an island bearing evidence of declension; there are, indeed, few of the West Indian islands that have not felt the transference of colonial interest and enterprise from the West to the East, whilst the constant drain of emigration, especially to America, tells very heavily upon a small population. Once the Caribbean Sea was the focus of all colonial hopes and development; now its place has been taken by the Indian and Pacific Oceans. Yet the island is anything but unprosperous or worked out. Its population of twelve thousand took full advantage of the high war-price of cotton, and its fifty square miles were extensively planted with the beautiful green plant, laden in season with the white pods. Money was made and spent, and the small planter especially enjoyed wonderful prosperity. There are stated to be rich beds of sulphur awaiting exploitation, whilst with the restoration of normal conditions the islanders may expect the tourist once again. The easiest method of approach, when the writer was there, was by the official mail-barge, which left Basseterre, St Kitts, every afternoon—a sail of twelve miles to Charlestown. One road, twenty miles long, runs all round the island, nowhere at any great distance from the sea. The motor-car facilitates the journey, and the excellence of the surface of the highway is indicative of an old and well-planned colony. No fewer than seven other islands can be seen during the circular trip—Barbuda, Antigua, Montserrat, Redonda, Saba, St Eustatius, and St Kitts; whilst throughout the whole journey the passenger has behind him the mountain-cone covered with a forest of evergreens growing like a ruff or collar round the neck of the highlands where cultivation ceases. Especially charming is what is known as the lowland view. There the traveller looks out upon a contracted streak of water only three miles wide at the narrowest point, with an islet in the middle of the deep blue stream, and bounded on the far side by the serpentine shores of St Kitts. For the purposes of administration Nevis was in 1882 united to St Kitts, and has since then been somewhat dwarfed by her more important and imposing partner.

MAN'S WORK.

CHAPTER XII.

I.

ON the 9th of August Sitwell, in the Enterprise office, received a wire from New York: 'Arriving 28th. Your later reports unsatisfactory. Hunt leaves early.'

The message was unsigned, it being considered by the sender that signatures were in such cases unnecessary, and might lead to complications.

As he laid the telegram down it quivered with a little vibration that Sitwell had detected for weeks in his own body, as of a violin-string tuned to a given pitch. He attributed it to lack of exercise and too much tobacco; but, nevertheless, it kept time to a small reiterant throb in his brain that now hardly ever ceased. He stared at the street, admitting silently that from Martin's point of view his reports had been disappointing. It was not for lack of money, but it seemed of late that it was increasingly

difficult to get things done. Men took his money, did nothing, and he was in no position to expostulate. Burbeck was under pay till the 1st of September, and the dealer who mixed emery-sand with his oil was looking for more business—but that game was played out. Casting round for alternatives, it appeared to Sitwell that underhand work was high in price—and often failed of delivery.

Behind all this were his own reports, forwarded weekly to New York—incriminating documents that staggered him even as he sent them in. He thought of them now, neatly filed, a record of dishonour. And it came to him that on the strength of a gruff promise he had transferred his very soul to the keeping of Spencer Martin.

Then there was Claudia. Though of a disposition which smiles at the protest of the deluded, he found himself strangely humiliated by a woman's contempt. He had not known before what it was to feel just like this. She recognised his existence, and suffered his company, up to a point. She hardly spoke to him, but her eyes were eloquent.

He jerked himself together. The overwhelming fact was that Shanklin had four hundred feet to drill, and twenty-one days to do it in—good average work in fair ground. Therefore, argued Sitwell, whatever remained for him to do must be done forthwith. He ran over possibilities, feeling unusually dull and impotent. Burbeck, it seemed, was the only man available for what moved in his mind.

II.

At midnight on the 13th, Harrison, pottering over the pump, saw it begin to race and the pressure simultaneously decrease. He was running along the suction-pipe looking for the break, when a hoarse shout from Denison brought him hurrying back to camp. The night was very dark. He caught a yellow flicker at the corner of one of the wooden buildings.

The moments that followed were seared into his brain. In a quarter of an hour the camp, excepting only the derrick and gear, was a shallow heap of smoking ash. They fought fire with clothing, towels, sand, and even their bare hands. Once the flame licked round a derrick-leg, and Shanklin beat it out with a shovel. Gertie threw food and dishes out of the kitchen window, working desperately, till Denison dragged her away by force. At the bottom of the well the sludge thickened for lack of water, till the plunging bit seized and stalled the labouring engine. Then, because there was no light to see, and no material left to work with, they lay down beside the ruins of the camp till morning.

At nine o'clock Sitwell slid past on the highway, but they did not see him. He noted the desolation, and smiled at the thought that Spencer Martin would not consider this unsatisfactory progress. Turning the car a mile away, he drove back to the city. A derrick was up on the Enterprise ground, but he only glanced at it and sped on. There was that in his mind he desired to say to Claudia.

But Claudia was not in, being called to lunch with Edith Winter, who had arrived the day before from Catalina. A little terrified by Shanklin's letter, Edith had telephoned to Claudia, moved by sincere friendship and a distant hope of useful news. There was no question in her mind of how matters stood between Sitwell and his wife. It was while waiting for her guest that she glanced at a noon paper and saw a paragraph describing the fire. She was still staring at it when Claudia arrived. She got up hastily. 'I 'm so glad you were able to come, for I 'm quite alone. Mother loves Catalina so much that she refuses to leave it.'

Claudia smiled. 'It 's good of you to have me.' They talked for a while. 'Have you heard anything of Mr Hunt?' Claudia asked presently.

'He 'll be here soon. I expect a wire any day. But he can't stay long. That 's the worst of an engineer's life. Did—did you see this?' The girl laid a finger on the paragraph. 'I don't know what to make of it.'

Claudia read—and her heart contracted. 'How dreadful!' she said unsteadily.

'It isn't so much the loss of the camp, but what it may mean by the 1st of next month. Does Mr Sitwell know about it?' There was a lift in the voice.

'He—he can't; he hasn't mentioned it.'

Edith glanced at her and pondered. 'I 'm going to tell you something,' she said gravely, 'that will be a surprise.'

The other girl pulled herself together. 'Yes?'

'I 'm a partner in that well. I put all my money into it. I 'm fighting your husband and Spencer Martin—just like the others. Jim doesn't know anything about it—and he mustn't—till the thing is finished, one way or the other. This fire means that I may lose everything, except the farm. I can stand that, but it will break my heart if my partners don't win out. When I asked you to lunch I didn't know anything about this—but I 've got to tell you—because'—she hesitated a little—'because I believe in you—no matter what happens, or has happened.'

Claudia fingered her bread and probed for an answer, but the only thing she could see was the vision of Shanklin's face as it must have looked when he surveyed the ruin of his hopes. She wondered how it came that Edith was his partner, but something deterred her from asking. 'Then Spencer Martin will get the property?' she ventured.

'I suppose so. They wrote to tell me that another four thousand was necessary—and they

were afraid I'd lose what I'd put in. They said at the start that that might happen, and only took the money when I made them. Now I can't find any more, and I don't know any one who would be ready to lend it, considering all the circumstances. So I suppose I'm broke; but I've met two of the finest men in the world, and that's something, even if I am engaged,' she concluded doggedly.

'And they need some thousands of dollars?' said Claudia slowly.

'They did'—the other girl sent her a curious glance—'but that was before the fire. Now, I suppose, it's more. All I can do is to go out there and say, "Don't mind about me!" But they will—more than about themselves. That sort of man always does.'

Claudia's breath came a little faster. 'When are you going out?'

'On the first motor-bus for Capistrano. I'd have hired a car last week—I don't now.'

'If our car is in the garage, may I take you out?'

'I'd like it awfully. I hate going alone—but'—with a wondering little glance—'are you sure you want to go? I thought——' She broke off in confusion.

'Don't think—let me take you. I'll send for it now.'

Claudia went off to telephone, with a queer thankfulness that Spencer Martin's work had made the car essential—and had saved it. Such are the anomalies that colour life. She found it hard to give her message, so full was her mind of a great half-formed resolution. In twenty minutes the machine was at the hotel. She wondered, as they got in, where her husband was. A moment later she stopped in front of a large jewellery-shop. 'I won't be a minute, but there's just one thing I've got to do.'

Edith Winter's face acquired a cynical little smile. It seemed queer that any woman of heart could, if she really felt as the girl was assured she felt, buy jewellery at such an hour. But, she reflected, Claudia's husband would do well out of this, and one man's meat was often another man's poison. She waited for ten minutes, then fifteen, with increasing vexation. At last Claudia appeared, putting on her glove. Her eyes and cheeks were bright.

'Get what you wanted?' said Edith Winter indifferently.

'Yes; but it took longer than I thought. I'm so sorry to have kept you.'

The miles slid steadily by, and Claudia glanced constantly at the small face beside her, with a great longing to pour out her troubled spirit. But it seemed that Edith Winter's comradeship and sympathy were for those who had sailed straighter than she had. Edith was thinking chiefly of the men who were losing everything except their honour—and of how many years' work it would take Shanklin to catch up.

As they passed the Enterprise ground she looked up with a queer little laugh. 'Suppose it turned out all right, after all?'

III.

Five minutes later they got out. Half-way through the orange-grove, a tall girl with fair, disordered hair and a torn dress planted herself in front of them. 'If you don't mind, visitors aren't wanted to-day.'

Edith nodded. I quite understand. I'm Miss Winter.'

The girl stared at her, the colour flaming in her cheeks. She looked tired, dirty, and dishevelled. The hard light in her blue eyes softened at once. 'Oh Lord! I've never seen you before. I didn't know. Have you heard?'

'Yes; that's one reason I came.'

'Well, there's not much left to come to. I'm Gertie Harrison—cook. Been here for a week—then this happened.' Her glance wandered to Claudia, at whom she looked with slow recognition. 'I've seen you before, though—one night in the city. Remember the row?'

Claudia nodded. She could never forget it.

'Well, I wondered after that if Mr Shanklin needed putting right with any one. Never saw him again till I happened along here and took hold to help out.' She turned to Edith. 'I'm sort of putting in time to help them along up at the rig. They're trying to get the bit free now, and if any one talked there'd be trouble. Sort of dismal anyway. It won't come to anything, but dad swears he'll drill while the money lasts, and then wreck the well. It won't be long.'

'When did the fire happen?'

'Happen? It didn't happen; it was laid by a sort of human snake that's been trying to bust the thing for months. It beats me,' went on the girl wrathfully, 'why such men live. Of course, they don't live long. Some one kills them, or they go mad, or something like that.'

Claudia looked away, and Edith's voice came in quickly. 'I think we'll go up now.'

'Then I'll wait here,' said Claudia. 'Will—will you ask Mr Shanklin if he can spare a minute, when it's quite convenient?'

An engine began to cough at a little distance.

'That means that the bit is free and they're going to start drilling,' said the girl grimly. 'But what's the use? They'd little enough time as it was.' She led the way, breathing resentment against life in general, and one human snake in particular.

Their voices died away. Claudia sat quite motionless. The engine throbbed irregularly and stopped. The procession of cars slid by on the highway swift and shining. The sky held an intense blue whose curve seemed almost solid as it stooped over the far peaks of the Sierra Madre. There were butterflies beneath the orange-trees,

and a drone of bees overhead. Presently she heard a step, and looked up.

Shanklin was close beside her, his sleeves rolled up, a stained and weary man. His eyes had the hard lustre of intense fatigue, and in them glinted an indomitable resolution. His face was that of one who fights for the sake of the fight, knowing well that the issue will be against him. He stared down at her without speaking, then made a sudden gesture as though to ask what part she had in these tense hours. 'Well, Claudia, the game is nearly over. Martin has had excellent assistance. I'm sorry—especially for Miss Winter. She tells me you know about that.'

She nodded, and he went on: 'Last night put the finishing touch, though I doubt if we could have hung on, anyway.'

'Money?'

'Yes—and not much at that. A hole has been punched in our credit. We should have been down and out now but for Mr Harrison's daughter. She's the second woman to the rescue.'

'And now?'

'If we got running, we might pull through with help. Of course, there's no camp left. Tents would serve, but we can't buy them. The grub is about finished, so,' he smiled gravely, 'we can't offer you anything in the way of dinner.'

Her lips began to quiver. 'Do you remember what I told you when—when I saw you last—that it was your money I used—not knowing?'

'You must not worry about that.'

'But, don't you see, Jack?—it isn't only that—it's everything. It's the things that count. I haven't had them since I married.'

'Steady, Claudia,' he whispered. 'You have to see it through, too. That's a bigger job than mine.'

She pressed a folded slip into his hand. 'Jack, it's all I can do. Let me be the third woman to the rescue. I took something from you—not thinking what it might cost you—but this is something that will help me to feel I've undone a little of the harm. And I'm terrified lest I'm too late.'

He glanced at it wonderingly, and saw a cheque for eighteen hundred dollars.

'Is it any use?' she pleaded. 'Tell me—quickly.'

He drew a long breath. A new light flickered in the tired eyes, and his shoulders straightened. 'Use? Yes, every use. Whose money is it?'

'Yours now—it was mine—every cent of it. Quickly, what do you want to do first?'

He stared at the cheque again, then at her, a slow smile on his lips. 'Do! I'd like to shout. Do you know this means that we may win through?' He broke off. 'I'll tell the others. Will you come up? And how can I thank you?'

'Don't try.' There was a responsive glow in her face, and she felt inexpressibly happy. 'You must never thank me.'

'Wait!' he commanded, and raced off. He reappeared in a few moments with hat and coat. 'My job is to get into the city as soon as I can. Miss Winter will stay, and sleep at the nearest ranch.' He glanced at the car. 'Do you think you could?'

She was at the wheel in an instant. 'Oh, Jack, Jack! Why do you think I'm here?'

(*Continued on page 329.*)

THE SWEET POTATO.

THIS plant, like the ordinary potato, is a native of South America, and, like the ordinary potato, is widely known and grown, although chiefly in tropical and sub-tropical countries, being more susceptible to climate and rainfall than the English or the Irish potato.

The red variety of this tuber thrives better, and yields better returns, than the white; hence it is the one mostly cultivated in the warm temperature of the tropics, where it forms a cheap and nutritive article of diet. In Barbados, one of the islands in the British West Indies, it is widely grown, and forms the chief staple of food amongst the blacks, who are as healthy and virile as is possible, with a muscular development which a Life-Guardsman might envy, thereby proving by ocular demonstration its nutritive value as a food. Analysis shows that the sweet potato has about 20 per cent. of sugar and 16 per cent. of starch, and with the advent of power or industrial alcohol it should form one of the recognised sources from which this class of spirit is obtained. With ordinary fermentation on the above sugar content, it should take about seventy-five pounds of the tuber to yield one gallon of 98 per cent. alcohol by volume at 15° C., but this yield can be considerably increased in cases where yeast-culture and bactericides are used.

The plant grows best and gives largest yields under irrigation, but it does well also in countries with a rainfall, if grown on light soil, well drained and kept dry. In Barbados, for example, where there is a rainfall, but where percolation is rapid, astonishing yields have been obtained. In Peru, where irrigation is the only source of watering, it is quite common and ordinary to see 'camotees' (the Mexican name for sweet potatoes) slightly larger than a man's head. And it must be borne in mind that the plant is not *cultivated* in the sense in which the word is used now; it is simply grown with no

attention other than that of a third-rate weeding or two to keep down the weeds. Under conditions of growing such as described, a yield of twelve thousand to fifteen thousand pounds of sweet potatoes per acre has been obtained. Therefore to the man with small capital the cultivation and utilisation of this product should appeal as being a paying investment.

Planting is done by cuttings taken from mature parts of the stem, each cutting being long enough to have three eyes or nodes, two of which are buried underground at no greater depth than two inches, while the other is left open above ground. The planting can be done on flat beds, but if systematically prepared ridges, about one and a half feet apart, are formed and the cuttings embedded, one foot apart, on each side of the ridge, midway between the top and the furrow, the vine luxuriates, and reaping is more easily carried out; besides which, rats and ants do not cause so much trouble and damage to the ripe tubers as they do on flat beds.

The soil most suitable is a light friable or sandy loam, but it is essential that it be thoroughly loosened up by deep and careful ploughing. On clay soils, however, the plant can give a good return if, in addition to thorough tillage beforehand, a process of tilthing is practised; but this method would involve increased expenditure on one side, and a reduction of profit on the other.

Weeding should be done once a week or once a fortnight, as circumstances demand, until the vines cover the ground, and so keep down the rank growth of weeds; and it is advisable at these periods to take steps to prevent the plant from rooting at the eyes or nodes, which causes small suckers of no value to form. These suckers draw on the plant, resulting in a reduction in the size and weight of the tuber grown at the crop root.

It is possible to grow and reap two crops a year, sufficient time being allowed for preparatory deep tillage after each harvesting, when the vines (being reaped before the tubers are dug out) are ploughed into the soil in the form of green manure, which is, in ordinary cases, all the fertiliser necessary.

It has been worked out by calculation that the value of a crop of sweet potatoes per acre is more than double the cost of cultivating, so that the margin of safety against loss should be wide, and (unlike the coco-nut and other such plants, which take five to seven years) it commences to bring in a revenue from the first year.

SIR MALCOLM'S HEIR.

PART III.

VII.

'MY father and I were always together,' she began. 'There was only myself, you see; my mother died when I was three—a mere baby. We lived abroad, father and I, the last few years, for the English climate did not suit him. It was abroad we met Mrs Grey, as she was then. My father married Mrs Grey scarcely a year before he died. Of course, he was much older than she, and when he died he left her in my charge.'

'Left her in your charge?' Ronald repeated, with unconscious emphasis on the pronouns. It somehow seemed a reversal of the usual course.

'Yes. You see, for one thing, this'—she waved her little hand comprehensively—'will all belong to me—it was my mother's—I shall be of age next month. And, besides, my stepmother, she—she—father felt she needed—she is really quite young; indeed, she is younger than I am in many ways—and she is very impulsive.'

'Yes, I know,' Ronald agreed. He remembered their meeting. 'It was very good of you,' he added gravely. Inwardly he was saying, 'Selfish old beast, that father! Married after his daughter had devoted herself to him. Put a silly young stepmother over her head—a regular old man's darling—picked up abroad, too; and then died, and left her a burden on the girl's hands.'

'Not good at all. I had grown very fond of my stepmother. She is very charming; so helpless and affectionate—clings to one.'

'Yes,' muttered Ronald.

'And I was trying to do it for father's sake—what he would have done. But I have done it so badly!' She looked at him with vast trouble in her beautiful eyes. 'I have failed!' she told him, with the tragic intensity of youth.

'Failed? How? Surely not. She looks very fit,' the boy said consolingly.

'She married again, scarcely ten months after father's death. No, no, don't think I blame her. The blame was mine. My father was so devoted to her, gave her such a happy life, obeyed her slightest whim, forestalled every wish. And then—alone with me, and I mourning him! She is like a child, and loves gaiety; it must have been dull for her. It was my fault that she fell a prey—oh, perhaps I ought not to say that—and yet, if you are to help, you must know all. Mr Stott married her for her money, poor little stepmother, and she hasn't got any. It is all mine—or will be next month. Father had very little. It comes to me from my mother.'

'Whew! I see. But didn't she—didn't your stepmother know?'

Hilda looked down at her hands in her lap, and he saw the colour creep up the fair little throat.

'She—she cared for him. It seems incredible, but she does still. He has a curious ascendancy over her. She knew why he wanted to marry her, but she could not let him go. She confessed it to me after. Yes, she let him think it was all hers.'

'Humph!' said Ronald Mackenzie.

'It wouldn't have mattered, but there is worse to come.'

'Let's have it,' he said cheerfully.

'He—Mr Stott—was very angry—oh, shockingly angry—when he found out. He said he had been "tricked," and that he would expose her; and he threatened to leave her—desert her, you know—unless——'

'Unless?' he repeated, as she paused.

'Unless I married his son.'

'Enter Ambrose!' cried Ronald. 'And that is why——'

'Yes, that is why.'

A light of comprehension came into the young man's face. 'Your stepmother has never seen the son?' he asked.

'No; he wouldn't come. It was he who found out, somehow, that the estate wasn't hers, and warned his father. But the letter came too late. That was one of the things they said—that she had intercepted it. But I have met him, and now he pretends——'

'The unmitigated cad!'

'Yes, I think you would call him that,' the girl answered wearily. 'But, of course, it isn't his real reason; it is the money. He is deep in debt, and his father has power over him somehow. Oh! I wish I hadn't any money or estate. No, I don't! I love this place! It was my mother's, and her mother's before that. And it was my home as a child, though it has been let all these years. And I feel I ought not to give up hold of my money now, for that is the only means by which I can carry out my father's trust, and protect poor Esmée. That is why I would not sign a deed of gift.'

'Did they ask you to do that?'

'Yes, my stepmother, Esmée. She cried and begged me to save her. It was terrible, but I stood firm. Then there came this marriage scheme. It seems a minor can contract a legal marriage. I suppose they want me to do it before I am of age. Oh, I don't understand, but I am beginning to be *afraid*! I am at the end of my strength!' she said.

Ronald looked at her. Such a mere slip of a girl, in her white frock. And she was alone in a nest of rogues and fools. 'I suppose it is awful cheek of me—I'm not an experienced lawyer, or an old friend, or anything. But—please, trust me.'

'Of course I trust you,' she said simply, and his heart began to beat.

'This is what has happened,' resumed Hilda. 'Ambrose Stott wrote to me, proposing marriage. He said that my stepmother had been guilty of fraud in telling his father she was rich, and promising to pay both his and his son's debts; that his father was going to divorce her; that he, Ambrose, had tried to dissuade him, but without success; that the only honourable way out of it that he could see was for me to consent; and that his father would undertake, if I did——'

'Oh, the damned curs!'

'You must not blame my stepmother, for, indeed, the man seems to have some power over her—mesmeric, I sometimes think. And she loves him, as she never loved father. And I remember how father put her happiness into my charge, and he is dead, and it is all my fault, and I have nothing else to live for.'

'Your father would not have wished you to sacrifice yourself!' he cried hotly.

'Perhaps not,' she answered doubtfully.

'Think of the years before she came, all the years when you were alone with your father,' he began.

'I think of nothing else,' she told him. 'We were everything to each other—till *she* came.' Hilda's voice broke, and she bit her lip, and turned her head away for a moment, till she could begin her story again.

'My stepmother must have known about the letter. She wrote a reply, as if from me, copying the handwriting, and signing my name.'

The young man gazed at her speechlessly.

'I think Mr Stott must somehow have made her—mesmerised her. And the letter got into his hands.'

'That's better than if it had got into Ambrose's.'

'Not altogether; because, though he says he recognises it as a forgery, he swears that he will bring it into the courts if I refuse to assent. You see, it promises marriage; and the son will, he says, sue me for breach of pro——'

Ronald burst into a hearty laugh. 'The case would go against them!' he cried. 'They are only trying to frighten you. Believe me, it is pure bluff!'

'They are quite capable,' she assured him. 'And how can I accuse my father's widow of forgery? Don't you see? They have me in their power!'

He turned to her suddenly. 'And this paper—the paper I am to stea—to get for you—is the letter?'

'Yes. You see, as she imagines you to be Ambrose, she will give it to you.'

'I see.'

'Will you?'

'Yes, I will.'

'Thank you,' she said simply, and she rose.

VIII.

They walked a little way in silence. Then he stopped short. 'What are you going to do to-night?' he asked. 'When he—this man returns, he will detect—he will know it wasn't his son who came.'

'I am not sure that he will,' she answered calmly, 'because, you see, Ambrose's luggage is here—and I have the telegram he sent.'

'But *I* sha'n't be here—I mean, *he* won't—that is—and he will come to-morrow—oh, it's all too risky! The fact is, you must not remain.'

'I did not mean to—I could not meet Ambrose. I have my suit-case ready packed, hidden in my own little car. I am going to London, to my lawyers.'

'The best thing you can do!'

'But I can't go to-night—there's no train. I must risk that. I can drive myself down early, and leave the car at the station. The express stops here at 6.23. I shall be miles away before they discover—and now, thanks to you, I shall go with an easy mind, for I shall have destroyed that letter. I need not even tell the lawyers anything about poor little Esmée. I am going to arrange with them that I pay her an allowance so long as he treats her properly. I think that will safeguard her——'

'Here she is, coming to meet us,' he interrupted, as they turned into the terrace walk.

The little lady approached them anxiously, scanning their faces. Ronald looked at her with cordial dislike. She was certainly outwardly attractive, he allowed. But that she should have supplanted, even with a father——

'Oh, you two dear young things, have you been quarrelling?' she cried, looking from one serious face to the other. She spoke lightly, but a haggard look came into her eyes, and she turned them accusingly to Hilda.

Ronald instantly remembered he had a part to play. 'I have been trying to persuade Hilda'—he said the name softly, almost reverently, and paused; and he heard the girl at his side draw in her breath quickly—'to trust me. You have a letter for me, she tells me?'

'A letter?' the woman stammered.

'Yes,' said Hilda gravely; 'I have told him I wish him to have it.'

'My child!' cried the little lady, and, with arms outstretched, made a short run to Hilda; but Hilda stepped quickly aside to avoid the coming embrace.

'My son!' cried Mrs Stott, unrepulsed, turning towards Ronald; but Ronald ungallantly stepped farther away on his side, and the little lady was left with outstretched arms between them. 'My children!' she murmured, and her arms remained open, but empty. She seemed rather distraught. Ronald, with great presence of mind, took one of the waving arms, placed it within his, and led the way towards the house.

'Let us fetch the letter,' he suggested. 'I am growing impatient'—which was true.

She laughed her little indulgent laugh, and they went indoors together, Hilda lingering behind.

In a few moments Ronald joined her. 'Felony, or something,' he said lightly; 'cheap at the price,' and gave her the letter.

She almost snatched it, and tore open the envelope. Ronald turned away, and gave undivided attention to the lovely Highland view. It was as well that he did.

'There's some one coming towards the house across that field,' he said. She rose, thrusting letter and envelope into her dress as she did so, and looked in the direction of the approaching figure.

'It—surely—it—yes! It is my stepfather! Quick! You mustn't be seen—through this window before he sees us.'

Ronald vaulted in at an open window, and found himself in a passage. He put out his hand and helped Hilda up, and she jumped lightly down beside him. For a moment they stood facing one another.

'Let me go and meet the fellow. I should love to,' he urged.

'No, no; what use would that be? Let me think. We must *both* escape—but there isn't a minute to lose. Leave it to me.'

She took him by the hand and almost ran down the passage. It led into another, stone-flagged. Here she walked discreetly, for the clatter of dishes and sounds of song betokened proximity to the kitchens; but they met no one.

They reached a door, where she paused, and he unbolted and opened it, and followed her across an outer yard, evidently little used, with grass growing between the stones. She hurried across, and through an archway into the stable yard. A boy was carrying some harness, with his back to them, and they stood silently till he went into a doorway. Then she signed to Ronald to follow her, and slipped into a coach-house close by them. In the dark interior stood a little car. She went quickly forward.

'I have driven a——'

'*I* drive it—it's my own—it goes like a bird!' she whispered back. The engine began to throb.

'Have you a wrap?'

'There's one in the car—and my suit-case. I had it ready for the early start.'

'What luck! But——'

'Get in. Quick!'

THE PEARL-FISHERS OF THE TORRES STRAITS ISLANDS.

By THOMAS J. McMAHON, F.R.G.S.

FEW parts of the world have had a more interesting development than have the islands of the Torres Straits, to the north of Queensland. These islands, probably volcanic fragments of the continent that is supposed to have connected Asia with Australia at one time, vary in size from a mere patch of sand or coral to a few some fifty square miles in area. Only the larger ones are inhabited, the islets being used either as fishing-stations or, if the soil is fertile, for native gardens. Under the humane conditions of an Act of the Queensland Parliament, known as the 'Aboriginals Protection Act,' a truly interesting regeneration of these natives has been going on for some years.

When, some thirty years ago, the fortune-hunters of the world realised the worth of the Torres Straits pearls, estimated by experts to be the clearest in the trade, a rush set in to rake the bottom of the northern shallow sea. This brought many unscrupulous adventurers, who began an exploitation of the Torres Straits islanders, finally bringing them to slavery and almost to the point of race extinction. The men were seized as divers for the precious pearls, and kept so constantly at work that many came up dead or paralysed. The women were scattered over the islands, and separation from husband, children, and home ensued. Thus, with broken hearts, a once high-spirited people succumbed to sickness, famine, and disease. Just in time, prompt measures were introduced by the Queensland Government to check any further ill-treatment of the natives. Protectors, as Government inspectors were called, began to encourage and enforce humanitarian ideals for the uplifting of the oppressed people. The London Missionary Society, then conducting the spiritual welfare of the islanders, ably assisted the Protectors.

Several years went by without any apparent satisfactory results. Epidemics of various kinds kept frustrating all good intentions and efforts, until it seemed a hopeless task, and looked as if in a decade the native race would be no more. But the splendid work of the Protectors and the Mission was not unavailing, and presently the corner of difficulty and disappointment was turned, and once again the islands became bright with the quaint songs and dances of old times. Population increased; schools were opened; mission work and teaching were more fruitful; and eventually a system of self-government was instituted. As a result of these reforms the natives are to-day a highly industrious, intelligent, and thriving people, possessing capabilities far above those of many native races of the South Seas. Both men and women are veritable giants in stature, handsome, with regular, well-formed features.

To further their moral as well as physical well-being they have been zealously guarded in their absorption of civilisation, and as a result drink and immorality are practically unknown, and they have the best reputation for truthfulness and honesty. This new vigour is reflected in the fact that the islands are all self-supporting; that is, by their own labours the natives not only support their families, their sick and aged, but also maintain their own institutions, such as municipal boats, churches, and schools, without the aid of the Government. The source of revenue is found in the main industries of the islands—pearling, bêche-de-mer and trochus-shell collecting; the Government merely paying the teachers and white administrators of the islands.

From the very nature of their industries the islanders are born seamen, with a wonderful instinctive knowledge of the coral-reefs and the movements of the uncertain winds for which the Straits are noted. No white man can take a lugger through the tidal rips, and many other dangerous places around the islands, with the ease and nonchalance of the native. The skill with which an islander can handle a swiftly speeding lugger, turning her within her own length in order to avoid some reef visible only to his keen eyes, is remarkable. The seas of the Straits are full of wrecks occasioned by foolhardy attempts of other navigators to sail the treacherous waters. The danger lies in a network of hidden coral-reefs which influence the tides and currents in an unaccountable manner. During the early days of the late war, when the German ships of war prowled through the sea north of Australia, seeking to destroy the cables between England and Australia, the Torres Straits natives were used as scouts, and the Germans came to know this. They made one attempt to steal through and cut the telegraph-wire between Thursday Island and north Queensland, but the vigilant islanders were too smart and wide awake; the German ships nearly found themselves in a trap, and departed without even firing one shot. Every island of this group has its own particular feature, either in its history, its people, or its scenic beauty.

Mulgrave, or Badu Island, is famous for the prosperity of its people; Mabuiag for the retention of many delightful native songs, dances, and customs, and for an annual festival to which natives flock from every other island. Yorke Island is historical, and the old schoolmaster there tells that Guy Boothby, the novelist, at one time sojourned with him as his guest. It was off the palm-bordered shores of this island that

old Spanish ships passed three hundred years ago—some to go to the bottom, to give up in these days all kinds of strange swords, heavy guns, and coins.

Darnley Island is noteworthy because of the great fish-traps which entirely surround the island. These traps are made in all sorts of shapes and sizes, of boulders (many tons in weight) that, it would seem, could not possibly have been placed in position without the aid of machinery. The natives have a legend that black giants built the traps, picking up the huge boulders as an ordinary man would pick up pebbles.

Murray Island—'the Garden of Islands,' as it is termed from its tropic luxuriance—is the most prominent of the Torres Straits group. Scientists from all parts of the world come to this island to study the coral insect, for it is in the midst of the great coral-insect breeding-ground of the Pacific. The various colours of the coral give the sea the appearance of a brilliant and beautifully marked opal, and adorn one of the most magnificent scenic spots of the world. Thursday Island is an outpost of the British Empire. This island stands at the entrance of the Straits, and its forts dominate the scene. It now has a garrison of Australian soldiers.

The native villages of the Torres Straits are partly European in design, laid out on a definite plan with streets. The houses are healthful, with many doors and windows admitting plenty of fresh air. They must be fairly large, for in these days of prosperity families of twelve or fourteen are common. In the old savage days three children in a family were considered sufficient; more constituted an unpardonable offence.

As in all communities, the temperaments of people vary, and while one man and his family occupy a grass hut, indicative of poverty, or perhaps laziness, another in a galvanised-iron mansion, with its veranda and wind-screen, will display wealth and energy.

Under their system of self-government there is on each island a Teacher or a White Administrator appointed by the Queensland Government; the people, having the suffrage, nominate and elect native councillors, two or three, according to the size of the population. Police, municipal inspectors, and clerks are appointed by this board. Within the terms of the Government the people are expected to be peaceful, to refrain from gossip, not to steal, lie, or thieve. Their villages, houses, food, and clothing must be kept clean and in a healthy state. Fishing-boats must be kept painted and in good working order. The native gardens must be tilled, and planted to their full capacity. Children must be kept regularly at school. Sickness, no matter how tr ing, must be reported to the authorities within one hour; it is by this excellent regulation that epidemics, once very prevalent, are now almost impossible. If the municipal inspector of a village is suspicious of a housewife—that her cooking is not up to the mark, that there is neglect in tidying her house—he promptly raids the home, and woe betide the lady if her saucepans are not in spick-and-span order, and her rooms and kitchen spotless! The careless wife is summoned before the Court, reprimanded or fined according to the seriousness of the case.

At weddings the bridegroom is the highly favoured person, inasmuch as custom insists on his wearing 'musical boots'—that is, boots that have a very decided squeak. The idea of this is that, as the bridegroom walks up the aisle, his approach will resound throughout the church so that all heads must turn to look at him. The bride may have the regulation bridal gown of white satin, wreath, and veil, but no shoes; her approach is not to be noticed. Another peculiar custom is the throwing of flour instead of confetti or rice over bride and groom, and as this is dispersed in a liberal manner all round, the most ludicrous effects result in the black faces and hands so besprinkled.

The Torres Straits Islands offer one of the finest examples of what can be accomplished among black people through the paternal interest of a white Government. Some ten years ago the London Missionary Society handed their mission work over to the Anglicans, or Australian Board of Missions, and this energetic body has done wonders in the education and upliftment of the islanders.

OUR ESCAPE FROM MOSCOW.

PART II.

V.

As time passed, Artem, our host, grew less and less friendly in his behaviour to us. He would not help us any more to carry water, chop wood, and heat the stove, as he willingly had done at first, and he gradually became even rude and disagreeable to us. At last he told us to look for other quarters, as he had quarrelled with his parents (at whose house he and his family had their meals), and needed now his *hata* for himself. But when pressed as to the true reason of his refusal to lodge us any longer, he confessed that he was afraid of the Bolsheviks. People talked about us, he said, and their gossip might reach the dreaded ones' ears. Then he, Artem, would be made responsible for giving shelter to bourgeois and spies.

This was an unexpected blow for us. In the whole neighbourhood there was no decent cottage even like that in which we had been staying. Most farmers had big families, often seven or eight children, sometimes married sons or daughters with *their* children living in their house, and they could not take strangers in, besides being likewise afraid of the Bolsheviks. We had also heard lately that great Red Army forces were approaching—in fact, were already some thirty to forty miles from our farm; and that preparations on a large scale for an attack against the Poles were going on. Both these circumstances made it impossible for us to stay there any longer, so we decided to move on.

A few days before, a Jew, who happened to pass our way, had told us that there was, some twenty-five miles from the farm, and on the very bank of the Beresina, a small town, Cz——, that had shortly before been completely burned down by the Poles. The Bolsheviks came there during the day, but went away for the night, having nowhere to sleep. If we could arrive there safely at nightfall without meeting any soldiers, we might, at dawn, cross the river on to the Polish side. We resolved to risk it, hired a cart, and, saying good-bye to our host, who seemed at the end quite sorry to let us go, we drove off in the afternoon at four.

Again we were on a cart, our luggage hidden under masses of straw, we sitting on top of it. This time, to make our expedition look even more innocent, I had put most conspicuously on top of the cart a big bundle of potatoes tied in a dirty sheet! Who had ever heard of spies or suspicious refugees travelling with bags of potatoes? In fact, we met many soldiers, but they hardly took any notice of us.

In Pr——, however, near a most picturesquely situated mill, a Bolshevik officer, accompanied by three soldiers, stopped us, and asked who we were and where we were going. My husband told him that we were returning to Cz——, where our house had been burned down during our absence, and where we still had relatives. As we had no papers to prove what he was saying, I don't know what might have been our fate had not the officer's attention during this dialogue been attracted by my behaviour. My heart was wildly beating with excitement. I somehow felt that these were the last Bolsheviks we should meet; that if they let us go we were safe, and should succeed in our undertaking. Wishing to hide my excitement and anxiety, I began to joke with the three soldiers, who stood nearer to me. They wanted to smoke—had tobacco, but no paper to make cigarettes with. I gave them some paper I had, and we became quite good friends. I was sitting on the cart, my feet, with the most dreadful common boots on, hanging on the outside. I looked so harmless, gay, and happy that the officer, who had been watching us (he might have had suspicions), gave the order to let us pass. I gaily said good-bye to my new friends, and we drove off. Our relief was great, as this had been a most dramatic moment. But my instinct had told me right: those were the last Bolsheviks we were to see on our journey.

After this we had only one more small adventure. It was already getting quite late, and we were some six or eight miles from Cz——. We had not met a living soul for the last hour, when our coachman saw a belated farmer going home. This man proved to be an acquaintance of his. On hearing that we were going to Cz——, the man said, 'Why, you are on the wrong track! You ought to go into that wood on your left. You are now driving in the opposite direction, and straight into V——!' V—— was the place where the chief Bolshevik forces of that whole district were concentrated. And so, but for this chance meeting, we should have driven straight into the enemy's camp, owing to our coachman Ivan's mistake.

We now drove through a beautiful thick and dark wood; now and then we saw the glowing red sunset, when passing through a clearing. It was altogether a most lovely drive, and soon after sunset we arrived at Cz——.

VI.

The little town of Cz——, which must have had some five thousand inhabitants before the fire, presented now the queerest aspect. But for three or four houses, it was completely burned down, and in the beautiful silvery moonlight its ruins looked very much like the ruins of Pompeii.

Soon a crowd of young people gathered around us. I have never before seen such a lot of pretty girls in a crowd. Our coachman, Ivan, hurriedly threw our bags off the cart into the middle of the road, and immediately departed on his way back, not listening to our invitation to stop and have a rest. He was too frightened, he said, both of the Bolsheviks and of the Poles; either the one lot or the other would surely take him prisoner, together with his horse, if he stayed much longer in such a dangerous place!

We asked the young people how matters stood in Cz——. They assured us that now we were safe, as the Bolsheviks who had been there last had said they would return to Cz—— only next morning at eleven, and we could cross the Beresina at dawn, long before they came. But the next difficulty was that at first no one would give us shelter for the night. There were very few houses left in the whole place, and the owners were too afraid of the Bolsheviks hearing later on that they had taken in people who escaped to Poland. However, the night being very cold, as nights in Russia often are in May (even frosty), two girls took pity on our children, and let us sleep in their house, in a dingy room, on two hard sofas. For this kindness they charged us, next morning, a price we

had never paid, even in the most expensive palace hotel, for the most elegant apartment!

Almost the whole night I sat up, sleepless, looking at the starry sky, hope and fear mingled in my heart. Was this our last night in this awful Russia, or again would something happen to hinder us? At dawn, just as I was beginning to doze a little, I was suddenly awakened by a loud knocking at the window, just above my head. Looking up, I saw an old man, who asked admittance into the house. He said he knew there were refugees who were going to cross over to Poland that morning, and whom he wanted to join. I roused my husband and our two hostesses. We all were considerably frightened, thinking the old man might be a Bolshevik spy who meant to arrest us (such things had really happened before). So, notwithstanding all his knocking, we did not let him in, and pretended to be asleep, in the hope that he would go away. However, we were mistaken, as we discovered later. He proved to be a very decent old Pole, who also wanted to cross the Beresina.

VII.

At six o'clock that morning we got up, and, without even taking any breakfast—we were too impatient for that—took leave of our hostesses, and went down to the river-shore, some five minutes' walk from the house. The weather was glorious, and the view on the Beresina simply magnificent. The winding river was of the most vivid blue, the same colour as the sky in the blazing sunshine. Along the Russian hilly shore grew dark, almost black, pine-woods, that stretched for miles in both directions. Between the wood and the river was a narrow strip of bright, clean, yellow sand. The opposite bank was low, and emerald-green meadows stretched as far as our eyes could see. There lay the long-dreamt-of small village, now occupied by the Poles, that seemed to us the gates of Paradise! It had once been connected with Cz—— by a wooden bridge, which was now partly destroyed. The remnants of that bridge and of the burned houses of Cz—— looked quite melancholy in the morning light.

We tied a white towel to a long pole, and stood by turns waving it as a signal to the Polish sentinels to come for us with a boat, while the rest of us sat down in the trenches to wait for our rescuers, and in the meanwhile to eat bread and eggs. As time passed and no boat appeared, our anxiety grew worse and worse, especially my mother's and mine. What if the boat never came at all, and if, instead of it, the Bolsheviks made their promised appearance from behind those mysterious dark woods? Then, indeed, would we be caught like mice in a trap.

Our suspense was made still harder to bear by a sharp wind that made us shiver. We tried to get a boat from some one in Cz——, but there was none to be found. It was already nine o'clock, our patience had been sorely tried for three long hours, and I was almost despairing, when at last we saw a boat on the river, and soon were able to distinguish a sergeant and five soldiers landing a little farther down from where we were standing. We ran to meet them.

And now a curious surgical operation took place. My little daughter has a big white plush dog, a very old friend from England. We took out a pair of scissors, and, while talking to the sergeant, cut up the dog's inside, and produced from it our Polish passports, which had been hidden there during all our journey. And a safe hiding-place it proved for such important papers.

And so, on that lovely morning, we crossed the Beresina, and were safe at last in our own country again.

Though my story is finished, I shall say a few words more. It took us eleven more days to get to Warsaw. We still had to drive on carts, to sleep on straw on the floor of dirty *hatas* with peasants and soldiers. At Boryssow we were at first kept in a kind of prison (until our papers had been thoroughly examined by the Polish authorities). There we slept on the floor, together with forty or fifty other refugees of the lowest classes. Everywhere the places we slept in were filthy and full of horrid insects. Then at Boryssow, before starting for Minsk, we were kept for two days and nights in a railway-wagon for cattle, while the train it was making part of was morning and night bombarded from Bolshevik aeroplanes. We also saw several battles in the air just above our heads. After all these exciting adventures, we were happy to arrive at last at Warsaw, and to have a good rest and a proper wash! In Warsaw we read in the papers that *next day* after our crossing the Beresina, at that very place in Cz——, the Bolsheviks began their great attack. So, by a series of lucky chances—I would call them almost a miracle—we had managed to escape safe and sound, and just in time.

For six weeks we had slept on straw without once getting undressed; for six weeks we had not eaten a proper meal, but lived mostly on bread, potatoes, and milk, and very often only on dry bread. We also managed to live all that time without using knives, forks, plates, or glasses. For six weeks we had heard almost continually the noise of shooting or bombardment. For six weeks the children, who before had been accustomed to talk Polish, never once, even by mistake, said a Polish word or sang a Polish tune. Nor did they betray by word or look where our treasures were hidden, although they knew the places perfectly well. In fact, they both were 'little bricks,' and never gave the least trouble during the whole of that hard and dangerous journey. What is still more wonderful, they never once got ill!

The plush dog we now keep as a valued relic.

THE END.

ABOUT MELBA.

By Sir LANDON RONALD.

MY friendship with this great singer dates back many, many years, and I can scarcely think of one milestone in my career without the name of Melba being in some way identified with it. As a matter of fact, my first meeting with her was actually on Covent Garden stage, when I was a boy of nineteen, doing all the dirty (musical) work there was to do. Why she ever took the slightest notice of me or troubled to ask my name of Arthur Collins will ever remain a mystery to me. She has so often told the tale herself in her own inimitable manner that I repeat it here with the greatest hesitation.

Arthur Collins, I may explain, favoured me very much in allowing me to stand—vocal score in hand—in what is called the 'prompt corner' of the stage, so that I might see and hear everything. One memorable night I was in my usual place, during a performance of *Faust*, when in walked Madame (as she was then) Melba, about five or ten minutes before Mephistopheles shows Faust the apparition of Marguerite. She sat on a wooden bench, looked about her, saw me, glanced quickly at me, turned her head, then looked me up and down, and asked in a very direct fashion, 'And who on earth are you?' I went hot and cold, red and white, tried to stammer out that I was a sort of maid-of-all-work, but a humble worshipper of hers, when Arthur Collins bounced in, gave some directions to the limelight man above, and turning to Melba, said in his quiet way, 'This is the young fellow I spoke to you about, madame. I want you to give him a chance.' In telling the story she always declares that from that moment her every movement on the stage was followed by my 'two great brown eyes.' I think it most likely, because her singing was so far removed from everything I had ever heard in my life that she completely hypnotised me.

A night or two afterwards Collins asked me if I knew Massenet's opera *Manon*. I told him I never had heard a note of it. He seemed much perturbed and disappointed. I asked him the reason. 'Oh, it's just bad luck,' he said. 'Melba wants to be coached in it, and I have told her I would send you to the Savoy to-morrow morning at eleven instead of old X. As it is, I suppose I must send him in place of you.' I had no intention of allowing such an opportunity to slip, so I begged him to get me a copy of the opera, and promised him that I should be note-perfect in the morning. He slapped me on the back, saying, 'That's the right spirit, young fellow. You'll do!' At eleven-thirty that night off I walked, with a copy of *Manon* under my arm, to the bed-sitting-room I occupied in Cambridge Circus, determined to sit up all night rather than fail to justify whatever Collins had told Melba regarding my powers. I think I finished my studies about five-thirty in the morning—and then I was so excited that I couldn't sleep. I just dozed, and kept on waking up with a start, convinced that I had overslept.

I was very nervous when I was eventually ushered into Melba's sitting-room and found her waiting for me. She was quite amiable and nice, but lost no time in superfluous conversation. She seemed to take it for granted that I knew the opera I had come to play, and explained that she was singing it the following week, and wished to refresh her memory by going over her particular part. And go over it she did with a vengeance! She would repeat one passage or recitative a dozen times until it satisfied her. I have heard people talk about what a marvellous thing it must be to be born with a gift such as Melba has, but how little they know the work that is necessary before that gift reaches the state of perfection which makes it unique! There is no new Patti or Melba to-day; and I fear the reason is not so much that there are no great voices, as because the young people do not have the patience to practise roulades, scales, trills, month in and month out, as their great predecessors did. They want to get to arias and songs before they are in any sense prepared—to run before they can walk.

At the end of the practice Melba asked me a few questions about myself, and paid me some charming compliments about my touch on the piano and the patience I had shown. I told her that my ambition was to become a great conductor and accompanist, and she took me seriously and encouraged me. Suddenly it occurred to her to ask me to play one or two of her famous arias for her. I knew them all, and,

 [*All Rights Reserved.*]

being at my ease by that time, played them really well. She became enthusiastic, and went into minute details as to what she wanted here and what she wished there, seating herself at the pianoforte and actually showing me. She told her maid to bring her a big pile of songs, and made me play Tosti, Bemberg, Hahn, Gounod, Lalo, and many of the songs of that period, with the result that as I left her she uttered a single sentence, which probably meant little enough to her, but everything in the world to me: 'Remember that, for the future, you are Melba's sole accompanist.'

And for something like fourteen consecutive years she kept to her word, and had no one else to play for her. It was only when my work became so heavy that it was impossible for me to travel with her that she reluctantly got some one in my place. But during those fourteen years what fun we had, whether it was in America, or on tour in England, or in London itself! One tour in particular stands out in my memory, and that was under the ægis of the late Percy Harrison, of Birmingham, the best-known concert-impresario of his time. Huge crowds, thunderous applause, lots of polite officials, policemen, and hotel servants, hundreds of autograph-hunters, heaps of motoring, plenty of fun, very little time or inclination to work—these are a few impressions left after a Melba concert tour.

To those who are not in the habit of travelling with royalty, a short tour with a famous prima-donna is strongly recommended as the next best thing. Perhaps I should qualify this by saying a famous prima-donna with Melba's temperament. From the moment she rises till bed-time comes, always full of fun, laughing incessantly, telling one joke after another, recounting all sorts of experiences with much humour, and for ever brimming over with mirth and merriment. It is contagious; we laugh with and at her. A hard-worked man like myself must perforce forget all the worries and troubles of life and make merry too, or feel out of it.

But here's the motor just arrived to take Dame Nellie to the concert-hall. Of course, she leaves half-an-hour before she need; she always does that for trains and concerts, with the result that she has never been known to be late in her life. There is a crowd waiting in the hotel hall downstairs, and a much larger one outside, with three or four policemen keeping order. 'Oh, ain't she beautiful?' is heard on one side. 'Look at her real *diaminds*!' shouts an excited voice from the top of a lamp-post. At the stage door another large crowd to pass through, and on reaching the artists' room, piles of autograph-books and letters. One little girl hasn't bought sweets for a month, so as to be present to-night; a little boy confides that he has a great longing to kiss a great singer like Melba. (A wag promptly remarks that he knows plenty of 'little boys' suffering from the same trouble.)

About this time Melba suddenly discovers she has no voice. This may disconcert the uninitiated until the first solo is over, but those who are 'in the know' are prepared for the statement, and sympathise with a twinkle in their eye. Then the interval comes, and the artists' room is bombarded by people hoping to get in by some means or other. All their efforts are in vain. A London policeman couldn't be more polite and at the same time more resolute than Mr Percy Harrison in his refusal to allow any one to pass that sacred portal.

'But I am a friend of Madame Melba, and——'

'And so am I,' is the rejoinder, 'and that's why I cannot let you pass.'

The concert is over; crowds rush round to see the diva leave, amusing themselves until she comes by making remarks about her Rolls-Royce and her chauffeur, who never takes the slightest notice. Here she is! Shouts of 'Bravo!' and 'Hurrah!' burst forth; a mounted policeman keeps the road clear, and off we go back to the hotel to enjoy a quiet little supper—perhaps the hour that all artists enjoy the most in their lives.

Next morning it is decided to motor over to Liverpool. It is only forty miles, and we should do it easily in a couple of hours. We leave in the most brilliant weather, and everything goes well until the chauffeur discovers that something has gone wrong. I do not notice it, but he does—which I, in my blissful ignorance, consider very wonderful. The 'something wrong' being duly righted, off we go again, spinning merrily along at a very legal rate, when, without the slightest warning, a most awful explosion occurs, and the motor is brought to a standstill. I feel myself all over to see if any bits of me are missing, and finding myself whole, I learn that nothing worse than the bursting of a tyre has occurred. The optimistic French chauffeur assures us that he can put a new tyre on in a *petit quart d'heure*, so Melba suggests that we should stroll on, and let him overtake us. We accordingly begin to stroll, and it seems that we are strolling through lonely country lanes for the longest quarter of an hour on record. Eventually we find that we have 'strolled' about four miles, and that it has taken us nearly an hour and a half. I admired a sweet old eighteenth-century house, and got barked at by a vicious dog for doing it. Most horrible, burglar-looking tramps were liberally tipped, partly out of sympathy, but mostly out of fear. But here comes the car, and, without further adventure, I find myself landed at the Adelphi Hotel, Liverpool.

At night another concert, with similar scenes of enthusiasm, similar crowds, similar—but wait! One little episode varies the order of things somewhat. Many of my readers may

remember a phenomenal little violinist who made his début as a boy of ten, called Franz von Vecsey. This was just previous to the advent of Mischa Elman, who practically killed Franz von Vecsey's success. There is no denying the fact, however, that Von Vecsey had genius, and Melba got to know the little boy well, and was most enthusiastic in her admiration for him. The little chap on this occasion was among the audience, and in the interval rushed round to kiss his '*liebe tante* Melba.' More jokes, more fun, heaps of chaff. 'Franz cannot play a violin; all he can do is to eat chocolates.' With mock humility and a low bow, Melba handed a violin (belonging to a violinist of the party) to young Franz, and suggested that he at once disprove such a statement. The challenge is accepted, and without a moment's hesitation the little fellow leans against the pianoforte, and, facing his small audience, plays an unaccompanied Prelude of Bach. Immediately there fell over us all a feeling of awe and wonderment, and we listened spell-bound to the remarkable phrasing, the beautiful tone, and the astounding execution of this little wizard. A few moments elapsed before we all regained our usual spirits. Melba was affected as much as, if not more than, any of us. Franz got kissed by everybody, and I couldn't help thinking of the different effect I produced when I used to play the violin. Certain it is I never got kissed afterwards. Franz obviously liked it, and would have played another piece on the same terms, but the interval was over, and we had to get back to work. With an affectionate leave-taking and a parting kiss for 'Tante Melba,' the little chap was taken back to his seat in the hall.

On to Edinburgh, Glasgow, Newcastle, Sheffield, Bradford, and then back to dear old London, which we all love so well. One concert differed but slightly from another, the enthusiasm being identical in almost every town. Touring under such conditions is great fun, excepting for the inconvenience of having to live in one's trunk!

I have been on many tours, orchestral and otherwise, with all kinds of artists, but I have never found a more delightful travelling companion or a kinder, merrier chum. Yes, that is what Melba is on tour—just a dear good chum.

(*Continued on page 345.*)

SIR MALCOLM'S HEIR.

PART IV.

IX.

'AND now, where are we going to?' Ronald asked, as they turned out of a side-drive on to the main avenue. 'They may see us at any moment, and follow.'

'Yes. Pull your cap over your face and keep your arm up—bend down a little. The great thing is for them to think you are Ambrose.'

'Good Lord! I——'

'Never mind. They'll think I'm taking him for a drive before dinner. Perhaps they won't see——'

'That stable-boy did; he came out when he heard the car, and had a good look at us.'

'Well, he won't think anything about it.'

'Till they discover, and ask questions.'

'And then it will be too late. My car is much the fastest.'

'When we don't return, they will think that we—that is, that you and Ambrose—have eloped,' suggested Ronald, leaning back luxuriously in the car.

She laughed gaily. 'Nothing matters! I have the letter!' she cried.

'Oh, of course it is of no consequence, as you say—but as a mere matter of curiosity, where are we going?'

She thought he was angry. And so he was, but it was because he was suddenly, and most unreasonably, jealous of Ambrose—or, rather, of the position that Ambrose was supposed to be occupying.

'Won't you smoke?' she suggested.

'Oh—thanks!' Ronald's hand went gladly to his pocket.

'And as to where we are going, that is for you to decide. What would you suggest?'

The sudden reversion of command, combined with the cigarette-case in his hand, soothed Ronald. He offered her the case, but she shook her head. Selecting a cigarette for himself, he gazed at it for a moment for inspiration, feeling his manhood restored, and aware that she had turned to him, and was awaiting his judgment. Who shall gauge a woman's instinctive tact?

'We will go to my uncle's,' he said.

She had had it in her mind all the time, as the only possible plan.

'Sir Malcolm Mackenzie's? But I don't know him.'

'He knew your father—and, anyway, he would be more than glad to be of service.'

'But won't he think it very strange?'

'He is nearly eighty, the dear old man, and he must have seen a good many things that are strange. Think, he was in the Diplomatic Service in his younger days, and—oh, nothing ever surprises him—he'll be all right. By a fortunate chance there are no other guests in the house; they all come to-morrow. And, by an equally

fortunate chance, we shall arrive just in time for dinner. Do you know the road?' he asked, as a turn in the avenue brought them in sight of the lodge.

'Yes, very well.'

A woman with a baby in her arms came out of the lodge and opened the gates. Hilda slowed the car, and the woman curtsied and glanced with undisguised curiosity at Ronald. But all she saw was the outline of his shoulders, for he bent down and fastened his boot-lace. As the gates shut behind them he straightened himself and met Hilda's eyes, and they laughed together like children.

'This is no end of an adventure!' he cried.

'Ah, what is the end to be?' she responded, becoming suddenly grave and sad.

'What, indeed?' he answered; but his expression was by no means depressed, as he gazed ahead at the blue hills that lay between her home and the home that was to be his.

The car spun merrily along the Highland road.

X.

'Middleton's daughter?' Sir Malcolm said, holding the girl's hand and looking down at her sweet, troubled face.

'Yes; you knew him well, sir, did you not?' Ronald put in, anxious to give him a lead. 'Miss Middleton——'

'Not well; no—oh no,' the old man said dreamily.

'Oh yes, sir, *very* well—intimately—you forget! Miss Middleton did not quite like to come, but I——'

Sir Malcolm did not seem to heed him. He was still looking dreamily down at the girl. Hilda's troubled face broke into a little smile as she realised Ronald's frenzied efforts, and she put up her hand to silence him, without taking her soft, pleading eyes from the old man's face.

'I must apologise, Sir Malcolm, and explain——'

'Dinner is served, Sir Malcolm.'

'Another place at table, Lawson; and tell Mrs Lawson that Miss Middleton has arrived earlier than we expected, and ask her to come and take her to her room.'

'Very good, Sir Malcolm.'

'Do let me explain,' the girl began again, as the servant closed the door.

'Not before dinner, my dear young lady. When you have reached my age, or near to it, you will have learned that nothing should ever be explained before dinner, and very little needs explanation after. It is all right,' he added gently, as he took her hand and patted it. 'It is an honour to me if I can do anything to be of assistance to you, and it is a great pleasure to have so charming a guest arrive at the end of a long and lonely day.'

'Oh, sir, I——' Ronald broke in; but again he had the sensation that his uncle did not hear or heed him. The old man was looking at the girl with a peculiarly sad, intent expression.

'A long and lonely day,' repeated Sir Malcolm. 'Ay, many years—many years. And you have come at the close of the day—so like her! Turn to the light, my child.'

'Like whom?' she asked, wonderingly, as she turned obediently to the lamp, and the pink-shaded glow fell on her fair face.

'Your grandmother; whom else?'

'My *grandmother*?' the girl repeated. 'Father's mother?'

'Your grandmother, Hilda Crichton.'

'Oh, my mother's mother! Did you know her?'

'Yes, I knew her—many years ago.'

'Ah, of course, she lived here. And my mother, she lived here too. Did you know her?'

The old man smiled. 'Can one know a baby?' he asked. 'I saw her once, asleep in her nurse's arms. That was after her mother had died. I am fond of babies, and I asked the nurse if I might take her in my arms for a minute, but she would not let me. She said it might wake her. I suppose, my dear, you are too grown-up for me to repeat the request with the next generation; but perhaps, as I may claim to have—well, met your mother, and to have known your grandmother when she was twenty—and very like you—oh! wonderfully like—I may ask you to accept an old man's hospitality and homage.'

'You are very good; indeed, I am most grateful. Twenty—that is just my age!'

'Ah!' Sir Malcolm looked at her, radiant in her youth. 'It is long ago,' he said dreamily.

The housekeeper appeared, staid and decorous, as if the advent of a girl in a motor coat and veil, over a white linen frock, were an ordinary occurrence after the dinner-hour.

'I shall not keep you long, for I have brought hardly any luggage,' Hilda said, with a little nervous smile, as she passed him.

'That was neglectful of Ronald,' he answered gravely. 'He should have brought all your boxes, somehow. Never mind; we will send for them in good time to-morrow.'

XI.

When the men were alone, a little silence reigned. Ronald left Sir Malcolm to break it, and glanced at him a trifle resentfully. He was feeling neglected, distinctly left out in the cold, and very curious. But Sir Malcolm still appeared to have forgotten his existence. He stood in the middle of the room, with his hand resting on the carved back of a chair, and his eyes on the carpet. Ronald expected questions; but when the old man spoke, it was not to ask any.

'It is fifty years since last I walked back over the hills from where you have been to-day,' he

said. 'It was a glorious autumn day, like to-day. And I thought that life and all it held was over and done with. How old are you, Ronald lad?'

'Twenty-five, sir.'

'Strange! I was twenty-five when I first met her, and she was twenty. We were engaged for a year, Ronald, and then—I was a headstrong youth when I walked across the hills that day. She married an Irishman—Desmond. That was before I went to India. I was in India when she died. She died when the daughter, your Hilda's mother, was born.'

He stood silent a moment, and Ronald, his resentment completely gone, stood by him, realising all that this long life had held, of power and adventure and achievement, and of romance and sorrow. He felt a mere unfledged stripling beside Sir Malcolm, at the beginning of the real things of life, and his heart went out to the old man he loved, as he thought of that walk over the hills on the glorious autumn day fifty years ago, of the headstrong youth and that other Hilda—what had come between them?

The old man was speaking again, dreamily, without looking at him. 'She has been dead for forty-eight years,' he said. 'Dead . . . a little slender girl in white, so like this you have brought here—so like—the same eyes when she looks at you—dead, forty-eight years—and to-day I have seen her again in those eyes—she is living still in those eyes!—I remember every little trick of her face!—and her hair—my God, boy!'

The old man's face suddenly quivered. His eyes seemed to see visions. His hands clenched themselves and fell at his sides.

'Sir! sir!—uncle!—I never knew——'

Sir Malcolm straightened himself, jerked back his head, and faced him suddenly, dignified and masterful. 'You did right to bring her to me, Ronald. And she is in trouble, poor little child! We will put that all right. Ah, here she comes.'

Hilda entered with a pretty air of shy diffidence, as Sir Malcolm went forward to meet her. The suit-case had evidently contained a change of dress, for she was in soft filmy black, with the pearls she had worn in the day-time showing round her throat. Ronald, following his uncle and Hilda across the hall, past the suits of armour and the equally immobile men-servants, felt again a little left out in the cold, till the girl, as she took the chair given her on the old host's right hand, raised her eyes and flashed a radiant smile at him across the table, full of comprehension and shy complicity. Sir Malcolm intercepted the glance, and looked quickly, with a glint of his keen eyes, at his nephew, just in time to see the young man flush and his eyes light up. A sharp look of pain crossed the older man's face, and then it was filled with a great tenderness.

The two young people talked little during dinner, and it fell to Sir Malcolm to entertain them. The old diplomat was fully capable of the task. He talked brilliantly and gracefully, adroitly choosing subjects likely to interest the girl, subjects that would allow her to show to full advantage, and listening with grave deference to all she said. He spoke of countries in which she had travelled with her father—he himself seemed to know every capital in the round world, and many of its untrodden tracts as well. He spoke of her father, whom he had known slightly. But there was a tacit avoidance of any allusion whatever to the happenings of the day.

When the fruit-dishes were on the table, the lights lowered, and the servants gone, he cut her some grapes.

'We will have our coffee in the library,' he said. 'It is Ronald's and my favourite room—eh, Ronald?—and if you do not mind coming with us, we can talk things over comfortably.'

'I will join you later, sir,' Ronald said, and Sir Malcolm nodded.

Ronald Mackenzie watched them disappear, at the far end of the hall, into the library. Then he went out on to the terrace, into the soft darkness and fragrance of the night, lit a cigarette, and let the disjointed thoughts of youth in love lead him where they would. He was just preparing to light his second cigarette, and had reached the stage of feeling bitterly jealous of his uncle, when he was sent for.

He opened the library door, and in a moment, by one of those strange tricks of memory, smelt the honey scent of heather warmed with sunshine. For there, before him, he saw the vision of the morning. A girl, sitting far back in the big arm-chair, her golden head against the dignified red leather and carved oak, her slim black ankles crossed on the square oaken footstool. Instinctively he glanced at his uncle—the uncle who, in his vision on the hillside that morning, had appraised the girl with keen, cynical, bitterly disappointed eyes, before which he, Ronald, had winced with shamed realisation. Ah, what a change had come over the fine old face! His uncle was leaning back, facing the girl, his glance resting on her with playful kindness, great tenderness, interest—and—yes, that was it—he was looking *happy*!—positively happy. He had never seen him look happy before. Dear old chap!

XII.

'And so that is what I proposed doing, and she agreed. I hope you approve.' It was long past midnight, and Hilda Middleton had gone upstairs an hour before. 'As to this man Stott—what a name, poor devil!—it won't be difficult to deal with *him* effectively. Miss Middleton has given me the name of her lawyers—I know

them, as it happens—and I think she can leave the matter in my hands. The stepmother must be protected—as far as a woman can be, married to such a man. However, it is easier to protect women—or men either, for that matter—from other people than from themselves.'

'And Miss Middleton, sir?'

'Had better remain here in the meantime. Cicely comes to-morrow, and she'll mother her. We'll send over to-morrow and let the stepmother know. A night's anxiety in the interval will be very salutary for that lady. Yes, Miss Middleton had better remain here in the meantime, as I told her.' He looked keenly at his nephew. 'Do you happen to remember what I said to you last night, Ronald?'

'Perfectly, sir.'

'Well, I should like to see her—to see you both—before I die, boy—if it is fated to happen—to see her here, in this very place where I once thought—to call her "Hilda."'

'I will do my best, uncle,' Ronald Mackenzie answered gravely.

THE END.

SOME BRITISH BIRDS.

III.—PARTIAL MIGRANTS.

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals*, *Tracks and Tracking*, &c.

I.

THE lapwing is a general favourite—particularly among the people of the hills, to whom its first arrival is the earliest sign of coming spring. I remember how, when a boy, we used to herald with glee the arrival of the lapwing flocks, and how, early in March, their cheery 'Kee-witt' along the river-margin, the sight of their black-and-white forms tumbling merrily in the air, meant to us that the long and not over cheerful winter was nearing its end. It was the first outward and visible sign of spring. Blizzards might follow, and for weeks yet the river might roar angrily with the snow-water from the heights, but nevertheless 'the ice was broken'—the lapwings had come! From that day on the valley was brimming with migrants; almost every day brought new arrivals from the coast, all following the ancient highway of the river.

The curlews were already here. Generally they appear in the hills about 11th February, the lapwings about 23rd February, though everything, of course, depends on the distance from the sea. It is a curious fact that, though the curlews are the first to arrive inland, the lapwings are the first to nest. The redshanks are among the early arrivals, flying, alighting, calling, calling; and at night-time one hears the soft, romantic piping of these feathered voyagers as they fly through the darkness, coming, passing, fading into the distance, till their notes become a part of one's slumbers. Now and then a honeymoon brace of oyster-catchers, the most handsome of our partial migrants, are seen drifting by with the daylight throng, gorgeous with their orange bills and striking plumage, their sharp, piping note recognisable from afar. They are already mated, and while the curlew packs wheel and manœuvre up and down the valley flats during the daylight hours, while the golden plover bands bank at prodigious speed hither and thither, and the lapwings dot the stubble-fields, the oyster-catchers alone seem to be swayed by a sense of settled motive—they are either going straight there or coming straight back, heedless of the whimsicalities of the remaining rabble.

Yet not all the oyster-catchers are finally mated when they arrive at their spring-time haunts, as I have repeatedly watched them fighting valiantly for the hands of their fair ladies. There were three participants in one of these struggles, and after a lengthy fray the victor strutted confidently up to his prize, while the other two hung about in the offing, piping dolefully. The hen, who had watched the contest with interest and approval, now turned upon the hero of it, jumped on him and struck him with her bill, then finally she flew away with one of the ignominious vanquished! This incident seemed, indeed, to argue true monogamy.

II.

The date at which the first lapwing eggs are collected is dependent entirely upon the immediate weather conditions. Whether the preceding winter has been mild or severe does not enter into the lapwing's reckonings. These are my notes on the subject, made at New Galloway in 1919:

'*February 23rd.*—Saw first flock of lapwings.

'*March 15th.*—Found numerous lapwing scrapings in fallow fields by Loch Ken. They will be nesting in full swing ten days hence.

'*March 24th.*—Strong northerly winds, with snow and rain day after day. All signs of lapwing nesting activities have vanished. They, and most other birds, are in packs again. But for these unusual weather conditions there would doubtless be many lapwing eggs by now.

'*April 6th.*—Weather improved. Fresh lapwing scrapings. Indications of nesting season exactly where they were on March 15th.

'*April 8th.*—Collected nine lapwing eggs—the first of the season.

'*April 12th.*—Lapwings nesting in full swing.'

Any one who writes up his bird observations will probably have similar entries to record.

The sensitive soul of the lover of bird-life shrinks from the thought of egg-collecting of any kind; but, taking a common-sense view of the collecting of plover eggs, which many appreciate as one of the greatest delicacies of the year, my studies of the habits and character of the bird involved lead me to conclude that so long as the dates of the close season* be observed, the species does not suffer by the activities of the collector. When a lapwing has been robbed, she lays again immediately. If her second clutch be taken, she again wastes no time, but at once produces a third. This process is repeated till, as in certain deplorable cases I have heard of, the hen-bird becomes so weak that she can hardly rise from the ground. Such persecution is obviously brutal, but with the proviso above laid down it is impossible for this stage, or anything approaching it, to be reached. In fact, in a normal season, the first nest of a bird having been spoiled, her second treasures were under the protection of the law by the time she had produced them. She lost her first clutch, which merely set back her nesting for a few days, and before there was any close season I have known individual lapwings to be nesting till well on into the summer, owing to the repeated loss of their early eggs.

Now let us consider what the taking of the first clutch means. As has already been shown, it does not entail a direct loss to the species, for the bird at once lays again. The result is that the young birds, when they appear, have the advantage of being several days later than they would have been, and consequently are less likely to be killed by storms. The loss of young birds is a direct loss to the species; it means a month wasted, and the bird which would have reared two broods, now rears only one.

But there is a more important point than this. Hundreds—nay, thousands—of the first eggs laid are destroyed by snow and frost. The old bird does not know that they are addled, and continues to incubate them till well on into the season. By the time she realises that there is 'nothing doing,' the season is so far advanced that it is even doubtful whether she lays again. Thus the bird which would, had she been robbed of her first frost-addled eggs, have produced two broods of chicks, now produces none at all, or, at the best, only one brood.

III.

The lapwing has many foes, among which inland gulls take a foremost place. I have repeatedly seen gulls alight in a field immediately after a flock of lapwings has alighted there. Thereafter there is no peace for the lapwings. The gulls sit idly watching while the weaker birds search industriously for food, and immediately one of the lapwings discovers a dainty morsel two or more gulls are upon him to take it from him. The gulls tease and disturb the lapwings to such an extent that in some parts the poor birds are really hard put to it to obtain sufficient nourishment. Also, the gulls steal their eggs and swallow their newly hatched chicks, and since so many gulls during recent years have taken to breeding inland, the lapwings in some parts have appreciably decreased in numbers.

I have seen a tawny owl systematically hunting the breeding-haunts of lapwings during the season that the newly hatched birds are about, and, of course, the carrion and hooded crows make terrible inroads into their numbers.

Another great foe of the lapwing, of which mention might be made, is neither man, bird, nor beast. In my diary for August 23rd, 1913, I find the following entry: 'Rabbit-shooting at Kilnsey' [in Wharfedale], 'I saw a lapwing running along under the wall. Gave chase and caught it immediately. It was in a starved and wretched condition, owing to its feet having become enmeshed in a wisp of sheep's wool. Two of the toes were missing from one foot, and one from the other. The stumps were quite healed, so its feet must have been entangled for several weeks.'

Some years previously I had caught a lapwing in an exactly similar plight, and on both occasions, when rounding up the unlucky bird, I noticed a curious antic in its behaviour. Every few paces the bird would stop and strike its beak into the ground with repeated rapid strokes—sometimes with such force as to have difficulty in withdrawing it. Why is this? It looked exactly as though the bird were feeding.

Examining dead lapwings displayed for sale, I have noticed that quite a large percentage of them are minus a certain number of toes, sometimes the whole foot being crippled. In this respect—the absence of minor members—the species is almost as remarkable as the sourdough toughs of the upper Yukon River!

IV.

So the coming of the lapwings is to the people of the hills what the coming of the swallows is to the people of the flat country. With the curlews and the redshanks and the golden plovers they are our first migrants, and thereafter the long silence of winter is dispelled by many piping voices. For, strange to relate, spring comes to the bleak heights, so far as bird-life is concerned, long before it dawns in the more sheltered regions. The birds of our hills—the grouse, the ravens, the plovers, the curlews—are the first to breed, and by the time the birds of the valleys are just beginning their family affairs those of the heathered slopes are well advanced.

* Observed in England prior to the recent Act, which totally prohibits the taking of eggs.

Visit the moors very early in the morning in the month of March, while the silence of winter still reigns supreme in the flat countries, and you will find that here on the hills the mating season of the bird-life is in full swing. The challenges of the red grouse ring across the slopes, faintly answered by the strange, vibrating notes of the hen-birds. High over the rushes a snipe is wheeling in mid-heaven, uttering his 'Chipp-churr' love-note as he flies, and now and then the elusive, musical sound of his drumming is wafted down as he pitches giddily towards earth. A redshank hangs on quivering wings above the moorland pool; his restless, tentative flight, as well as the low, persistent notes he utters—utters for hours on end, till the melancholy of it nearly drives one mad—are peculiar to this season, the Love Moon. The curlews are flying, alighting, calling, calling, vastly conspicuous as they fly, but vanishing like vapour as they alight, so closely does Nature guard her children by their colouring; and the curlews, too, utter many strange notes peculiar to this season. As the days pass by, these birds become more and more restless, till it is indeed a sight to watch their powers of flight. They are the most anxious and restless of all our hill birds, and their solicitude seems to embrace all the other wild kindred of the range. Longer in the leg than the rest, their eyes set high in the head, they are the first to see danger and to give the warning, and should it be unheeded by any other bird or beast they seem to go half-mad with anxiety, dashing hither and thither around the heedless one with cries of the utmost desperation.

The manœuvres of the male curlew while he watches over his wife sitting her eggs are fascinating to watch, for this bird has unique powers of flight. Rising vertically on lashing wings, he hovers in mid-heaven like a gigantic humming-bird, wheels at prodigious speed, then comes wafting vertically earthwards with wings erect, night-jar or buzzard fashion. The bird's hawk-like flight at this season has given rise in many localities to the belief that it is an egg-stealer, and this belief dies hard. Certainly the flight of the curlew during nesting-time would seem to suggest that it is scouring the moors in search of something, but I have not the least doubt that it is never guilty of taking the eggs of other birds. What may happen is this. An egg-thief comes along, the curlews catch him in the act, and such is their distress that they hover above, and even alight on, the earth near by. The keeper watches them, and going up, finds the plundered nest. The circumstantial evidence against the poor curlew is very strong, but all the accusations I have heard against this bird as an egg-thief might be explained away as above. It is hard to believe that the curlew, considering the curious design of his bill, can ever have acquired the habit of draining eggs. Eating soup with a fork would be a simple task compared with such a feat.

v.

The anxious solicitude of parent curlews for their young is pathetic to observe. The shepherd's dog crossing the moor a mile away is watched with the utmost vigilance, and should he draw nearer, one of the birds swoops towards him, almost lashing him with its wings, and resorting to every endeavour it knows to turn the direction of the trespasser, while the other parent herds and hustles the chicks to a place of greater safety, finally inducing them to lie concealed in different hiding-places. But curlew chicks seem to be among the most wayward of earth's simple children. For a time they lie obediently hidden, but very soon they tire of it. One pokes up its head, then another, answering in soft, feeble notes the wild, strong call of their parents flying and alighting near by. Then one gets up and begins to stumble among the tussocks on clumsy chicken legs; another gets up and begins to stumble in the opposite direction; while in the interim the parents go clean mad in their efforts to divert the approaching source of danger. Often they betray the whereabouts of their young on the same principle as that employed in 'hunt the thimble'—hot, cold, warm, freezing; but the little curlews have a friend higher and wiser than their poor devoted parents, and in their protective colouring lies their safety.

It has often occurred to me that it would not be hard to learn curlew language if one could devote the time to becoming sufficiently familiar with it. When I was a boy I made some steps in this direction, but I have forgotten what little I learned. The curlews possess a far more extensive vocabulary than most wild birds, and any one who has studied them will agree that their different notes serve as a method of intercourse. There is the ordinary familiar call-note of 'Coy-coy!' which would seem to be equivalent to 'Coming-coming!' There is the wild S.O.S. alarm; there is the 'danger in the distance' warning; there is 'danger draws nearer'; there is 'danger turned aside,' in addition to the usual bubbling notes of greeting and joy, and the low, sad note of loss and sorrow, one of the most pathetic sounds in all the wilderness. I have heard a curlew that has been robbed of her eggs utter this note when, for days after, she haunted the scene of her sorrowful memories.

From the foregoing it will be seen that, in spite of the suspicions that still exist in some parts of Scotland regarding the 'whaup,' which for long was classified among witches, warlocks, and the like, there is much that is lovable in the character of these wild birds of the hills. To many a lonely shepherd their shrill, cackling alarms are the songs of spring, the spring-time of boyhood, renewed each year by the coming of these cannon-balls of the upper air.

The call-note of the golden plover is among the most plaintive of moorland sounds, yet among the most joyous, and it is strange how exactly the notes of these hill birds, like the garments they wear, are in harmony with the wind-swept loneliness of their surroundings. I have heard plovers passing over London at night-time, and their musical piping, high in the heavens, was so incongruous as to seem almost discordant.

VI.

It is difficult to decide what are the factors that govern the feeding-hours of these moorland birds. They are both diurnal and nocturnal. On certain nights a death-like stillness reigns upon their haunts, while other nights the very air vibrates with the call-notes of feeding birds. They are everywhere astir, and weather conditions do not appear specially to influence their movements. I have been on the hill at midnight when every tuft of heather seemed to find voice, and the following night, perhaps, at the same hour, in the same weather conditions, not a bird was to be heard. Sometimes they are astir all through the night; sometimes they settle to roost with the dusk and are silent till daybreak—and this seems to apply to all birds which winter along the seacoast. If the nights of special activity immediately succeeded rain it would be easily understood, for their food would then be most plentiful, but this is not so.

I have often wondered whether the feeding-time of these birds living inland is influenced by the tide of their maritime haunts—that is, whether the periods of activity inland coincide with the periods of activity along the coast. When the birds are living by the sea, their feeding-times are decided entirely by the tide. They are active when the tide is out, whether it be day or night, and idle during the hours of flood-tide. Such strange and distant conditions often govern the movements of birds that the theory advanced is not so wild as it may at first seem. When these birds are living by the sea they often retire miles inland during the flood-tide, but just before low-tide is reached they flock back to the sea, arriving at exactly the right moment, as though acquainted with the movement of the tide to within a minute.

All the wading birds seem to undergo considerable fluctuation from season to season as regards numbers of each sex. I remember that one year thousands of male unmated redshanks thronged inland, and were to be seen flying about in droves along the shores of hill lochs throughout spring and summer. These merry bachelors had clearly not a care in the world, and seemed to be enjoying themselves immensely. Another year hardly a redshank will be seen unaccompanied by a mate.

I have observed the same thing regarding the curlew. Some years great flocks of unmated birds frequent the seashore throughout the spring, but another year the shore will be almost destitute of curlew-life during the nesting season.

Two or three miles off the coast of Devonshire my brother and I one day saw a curlew alight on the surface of the sea, and remain there several seconds, eventually rising without difficulty and pursuing its way. I have seen a sandpiper lose its footing while wading, and coolly proceed to float down-stream, carried by the current several yards ere it was able to touch bottom. The incident seemed to cause it not the least dismay.

MAN'S WORK.

CHAPTER XIII.

I.

AT noon on the 16th Hunt arrived at Los Angeles. He had wired to Sitwell that it would be unnecessary to meet him, and was rejoiced to find Edith at the barrier. They had a delightful hour before he remarked that, since Spencer Martin was waiting his report, it would be necessary for him to proceed to the property at once.

'You are so mysterious about that lease,' she said, making a little face. 'Could I come this time?'

He pondered. The day was fine, and the thought of her in the car beside him was alluring. 'We might compromise. That is, I'd rather you didn't actually visit the property with me, but you might wait close by.'

'And that wouldn't be unprofessional?' she said demurely.

He laughed. 'I won't be professional till I get there. Watch me. Have you seen anything of the Sitwells?'

'Not much, but I've heard of him once or twice. Do you like him?'

'There are all sorts of folks in my business. I like her.'

Edith nodded. The ice was getting thin. 'Is Mr Martin coming out?'

'I expect so—later.' He wanted to forget Spencer Martin and all connected with him, so for the next hour they sped happily through an earthly paradise almost as fair as that which was encompassing their thoughts.

'Is it going to be long, Jimmy?' she said, after a telepathic pause.

His arm slipped round her. 'I'll be getting another fifty next month. We could nearly do on that. But, you see, I'd be away most of the time.'

'If you had capital, what would you do?'

'There's nothing better than oil—if you understand it.'

'I suppose that's it,' she murmured—'if you understand it. We're nearly there now.'

He turned and stared at her. 'How did you know?'

She bit her lip. 'Didn't Mr Sitwell say it was about forty miles out?' She looked at the speedometer for the first time. 'We've gone thirty-seven.'

'You're a remarkable girl, Edith. I didn't know you'd noticed that. I'll drop you just round the next turn. What will you do till I get back?'

'I've got lots to think about, Jimmy,' she said with a little laugh.

II.

Five minutes later Shanklin, sweating over a very temporary forge, saw the engineer approaching. He laid down the hammer, and extended a grimy hand. Hunt took it in his firm grip.

There was something heroic in that salute, carrying with it much of the essence of manhood. It expressed the mutual recognition which honest men have for each other in times of stress. Hunt, glancing about, saw what a change was here. The blistered derrick-legs told their own story, and irregular outlines of black cinders, amongst which were pitched a cluster of tents, said the rest. But the rig was working as smoothly as ever. A chalk-mark put the present depth at seventeen hundred and twenty feet.

'Trouble?' said Hunt inquiringly.

'Yes—the other night. We've fixed it up. Lost a good many hours, though.'

'How did it happen?'

Shanklin's face did not alter a muscle. 'Just how it happened we don't exactly know.'

'Where's Harrison?'

'Asleep. We've been—well—rather busy here, and he takes it when he can get it. Have some coffee?'

Hunt laughed. 'How did you guess?'

Shanklin whistled, and a mass of yellow hair protruded itself from one of the tents. He asked for coffee. Presently a tall, blue-eyed girl waved a dainty arm, and Hunt went in, wondering. When he came out he looked at his host gravely.

'Putting on a good deal of dog out here, aren't you? That's the best coffee I've had in months.'

Shanklin squirted oil on a bearing that began to complain. 'Under the circumstances we think we're entitled to the best that's going. That isn't the only woman who has helped us along.'

'When are you going to shoot?'

'Harrison says the 29th. That leaves us time to get to the bank and back,' Shanklin added with a laugh.

The engineer fingered the coins in his pocket. This was a straight man, and he knew it. Months ago Edith Winter had marked the resemblance between the two. Now, in a way, they looked less like each other. One was wearied to the limit of his endurance—dressed in grimy clothing, unshaven, a man of toil, and, more than this, a man deprived of his heart's desire, and fighting desperately for his future. The other was well dressed, confident, established in his profession, his future assured—and with the girl he loved waiting a few yards away. But in spite of the apparent gulf, there was the same fixity of purpose, the same candour, the same unshakable confidence in the things that are worth while.

The thump of the engine continued, and Hunt, dipping his hand in the sludge, examined it critically. Presently he looked up.

'It seems good to me—straight sedimentary. You reckon on two thousand feet, don't you?'

'Yes—barring accidents.'

'You ought to make it—and, by George! I hope you do.'

'Thank you,' said Shanklin quietly. 'I believe that.'

'My boss wants to be here on the 29th. He'd like to see this well shot.'

What was in Shanklin's heart about Spencer Martin did not bear repetition, but he only smiled at the intensity of his own feelings.

'I've no objection.'

'Some men wouldn't stand for it.'

'We've stood for a good deal here, Mr Hunt.' The tone underwent a subtle change.

Hunt sent him a comprehending glance, as though to suggest that he understood, and sympathised.

'I'm in a queer box—with you,' he said slowly. 'I've the feeling that I would do just what you're doing were positions reversed. But outside of that I'm backing you. I wish I had an interest.'

'If you were a free man, I'd make you an offer. Want to see Harrison? I'll wake him.'

'No. As a matter of fact, Miss Winter, my fiancée—you don't know her—is waiting in the car. I'll get back now, and see you in a few days.'

'Why don't you bring her up?' said Shanklin soberly. 'It isn't pretty—but—perhaps it would interest her.'

'I will—on the 29th. Is that all right?' He laughed a little. 'I'm just trying to imagine the scene if your well comes in strong. You embracing the cook—hats in the air—the reward of honest toil—the kind of face my boss will have—my own envy—my girl's questions as to why I don't go and do like-

wise. I hope to God it does work out just that way!'

III.

Hunt waved a hand, and went off to find Edith. They walked arm-in-arm toward the car, which, diplomatically, she had sent half a mile up the highway. His brows were pulled down, and he seemed hardly the happy lover. She sent him a curious glance.

'Would it be unprofessional to tell me something about this property? You're very mysterious.'

'It's one of those cases where my heart is not in my work.'

'But why?'

'Imagine two good fellows—little men in the business—men who have only just started fighting with their shirts off against money, and influence, and—well—other things that shouldn't come into the game at all. If they win out, the industry gains by having them. If they're beaten, the industry loses what it needs—more decency. I wonder sometimes,' he went on a little bitterly, 'whether the decent man has a fair show in this life.'

The girl pressed his arm, being drawn to him more than ever. 'I love you for that; but don't you feel inside that in the long-run the decent man has the best of it?'

'Not in the oil game.' Something moved him to unburden himself still further. 'I'm going now to see another fellow,' he continued. 'My private opinion is that he's not fit to clean these men's boots, but the odds are he'll win out on this property, and make his fortune. It's these contrasts that sicken me. By George! I'd sooner drop this business altogether if I'm never going to be in a position where I can give a good man a leg up.'

She indulged in a little secret smile. 'You're going to see Mr Sitwell?'

'Unfortunately, yes. I have to. Then for Catalina with you.'

'Couldn't you stay here for the next few days? There's so much to do and see.'

'All right.' He was a little puzzled, for, having read of the golden sands of that fairy isle, he wanted to see them—and with her.

'And if you happen to meet Mrs Sitwell, give her my love—remember, not my best wishes.'

He nodded; but when, two hours later, he sat talking to Sitwell, all thought of the man's wife left his brain. Sitwell was jerky and nervous, continually leaving his chair and conversing in high-pitched, ragged tones that Hunt found increasingly suggestive. His eyes were very bright; their colour appeared to change constantly; while his tall figure, as though inoculated with some fiery virus, seemed to move incessantly. He looked at his visitor almost furtively, his long hands clasping and unclasping.

'You expect Mr Martin on the 29th?'

'Yes. Harrison will shoot then.'

'How far are they down now?

'Something over seventeen hundred. I've an idea they may make it.'

'What!' Sitwell leaped from his chair. 'After that fire? Impossible!'

Hunt looked at him silently. 'The fire didn't hold them up long. They're drilling now.'

'The papers said they were wiped out.'

The younger man revolted suddenly and savagely. Then, as he scrutinised the face in front of him, it seemed that Sitwell was on the edge of some great disaster whose proportions already began to swell before his distorted eyes. This invested him with a strange new interest, such as one feels in an explorer who starts out to rediscover forgotten lands. He appeared almost to epitomise the oil game, with its frenzy, delirium, and stress.

'The papers missed it,' said Hunt, after a pause.

'Had—had Mr Martin any messages?'

'No. I've wired him to-day, giving the depth of the hole.'

'Did you mention the fire?'

'That's not my end of it.' Hunt's voice was cold. 'By God! Sitwell, these fellows deserve to win out, and I hope they do. When you see Martin, you can tell him that if you like.'

He stormed out, slamming the door behind him with a crash that lifted Sitwell from his chair. The air seemed foul in that immaculate office. Hunt was seized with a great desire to do something for Shanklin and the others, a desire intensified by what he felt was a slimy contact with Sitwell. But there was one thing he could not do, being in Martin's employ. Presently he turned into a tobacconist's, and, selecting a box of the best Havana cigars, scribbled Shanklin's name and the nearest post-office, which was on one slope of the Richfield anticline. A little later he rejoined Edith, his eyes still cloudy with thought. 'Let's have a good dinner. I want to get a certain taste out of my mouth.'

She smiled with a divine understanding, and he felt as though all the winds of the world had blown through and cleansed him.

(Continued on page 347.)

THE MOOR IN SUMMER.

I LIE amidst the gold of gorse and broom,
And hear the song of skylark far above;
He sings his song of rapture tirelessly—
His song of bliss—his ecstasy of love!

I lie amidst a rolling sea of gold,
A boundless sea of beauty, wave on wave
Of vivid gold! This is no earthly dross
That kills the soul! God spends this wealth to save.

The soul! . . . O Crœsus! cast your minted lure!
Grasp freedom! See this blaze of living gold,
And hear the bird sing endless songs of love!
Come, Crœsus, come! Lo! here is wealth untold!

JESSE DRINKWATER.

THE LEADED SPEAR.

A BOAR-HUNTING STORY.

By Lieutenant-Colonel J. W. WRAY.

AS I do not think many have had the opportunities I have had of hunting the wild boar single-handed, I can claim to know something about the weapon that is most effective, and at the same time the least dangerous for the man who uses it and for the horse he is riding.

I have always used the long spear, as distinguished from the 'jobbing' or short spear, and I therefore speak of the long spear only.

There is a theory that by having a great lump of lead at the butt-end of the long spear driving-power is given, but in my opinion that is quite wrong. The driving-power should come from the pace of the horse, combined with the strength of the rider's arm at the moment of striking; while the aim is greatly assisted by having the weight *not* at the butt-end, which makes the lighter end wobble, but at the point itself, to keep it steady in its direction. I have seen two or three accidents, when I have been out with other people, from the spear being forced out of the rider's hand and the weighted butt-end dropping on the ground, throwing the point of the spear upwards, ready to transfix anything that may come along at the moment, which is generally, of course, the poor horse, or perhaps the rider himself.

I once had an experience of this, when the mare I was riding was severely injured, and I narrowly escaped being impaled myself. The mare had been very kindly placed at my disposal with one or two more by the well-known and grand sportsman, the rajah of the remote province in which I was doing duty at the time.

A large boar had been marked down in some scrub jungle, or series of scattered thorn-bushes, and the news of him was brought to me. As it was fairly good country, with no large cover very near, and therefore with plenty of room for the run and the fight, I chose for this occasion an inexperienced and rather clumsy mare, a gray, for her first time 'after pig.'

My wife usually rode with me, but this time she accompanied a friend who was suffering from rheumatic gout, and they came along in a bullock-cart. This friend had been a great sportsman, and, however ill he might be, he always came out, somehow, when he could. He was a believer in leaded spears, and, knowing my prejudice against them, he persuaded me to try one of his 'just for once,' and I foolishly consented.*

We all went together till we came to a patch of stunted thorn-bushes, where the boar, on his way back from his feeding-grounds, had determined to halt for the hot hours of the day, instead of going on to lie up in the larger jungle, or cover, a few miles farther on. Boars often do this when they are late in leaving their feeding-grounds in the early morning, and have a long way to go.

These 'outlying boars,' as they are called, are generally alone, and they are marked down by the *shikari*, or tracker, making a series of circular casts, till he encloses the boar within a large circle. Gradually narrowing it, he can almost tell in which bush the beast is hid. He then puts his companion in some concealed position to watch whether the boar moves or not, and he goes himself to give the news and bring the rider. No beaters are required.

We went quietly along till a soft whistle, like the note of a plover, revealed the watchman, who silently pointed to a large thorn-bush one hundred yards away. Leaving my wife and my friend in a safe place to watch the start, I went on with the two men till we came to the bush where the big boar lay. Some clods of earth thrown on to the thorns, and a few shouts, and in an instant there was a loud 'Wough, wough,' a tearing and scattering of the undergrowth, and the big gray form emerged, carrying a mass of brambles with him, and was away on the other side heading for his stronghold, some three miles distant.

It is always well, when rousing a boar from his lair, not to get between him and the direction he is likely to take, for he will invariably attack the rider on his way past him, and can easily knock him over, horse and all. I have had my spear snapped in an instant by disregarding that little principle.

I was on the proper side this time, and we got away splendidly. The boar was very large and heavy, and he seemed angry at being disturbed in the heat of the day, for he did not go very fast at first. For a little time I suited my pace to his, but, as some baubul-trees began to appear, I put on a spurt, and lessened the distance between us. On getting nearer to the baubuls, I saw they were quite a thin patch, and knowing that the boar would go straight through them, after refreshing himself in the muddy pool that was sure to be there, I eased my mare to let her get her second wind, and cantered slowly on, while the boar disappeared amongst the little trees and patches of thorn-bushes. As I passed the little circle of mud, which in the rains had been a pond, I saw that the boar had rolled in it, and had gone straight on without pulling-up at all, which meant that the large cover he was making for could not be very far in front, and

* In the same way I was once persuaded, much against my will, to use a hollow bullet for a tiger in thick jungle, and I have regretted it ever since.

that it would take some hard riding to come up with him before he reached it.

On passing out of the baubuls into the open, I caught sight of the boar about a quarter of a mile ahead, going at a good steady pace, but not fast, as he evidently thought he had shaken me off. I shook up the mare and began to gallop, and as I drew nearer and he realised that I was on him again he went ahead like a shot out of a gun for a short distance. I did not respond, and by degrees he fell back to me, and then for half a mile we galloped on, with about twenty yards between us. Gradually I drew nearer and nearer to him. We were both going at a desperate pace, when all at once the huge beast slackened a little, gave a sudden sharp turn to the right, meaning—as boars always do—to draw me after him, and then, if I turned half-right after him, to swing round sharp across my mare's legs and throw me over. I did not turn, but kept straight on, and in an instant he came back on to his original line, and gradually drew inwards towards me, and we raced along, my mare's head level with his hind-quarters.

The time had come for me to put down my spear, so I leaned over to the right, and in one second more I should have speared him behind the shoulders—what I was waiting for, for I always tried never to touch a boar until I could do so fatally. That second, however, was a second too late. The boar made one more feint outwards, and then, swinging round with a tremendous dash and a loud, angry 'Wough,' he was across my mare's forelegs. I tried to turn her to the left, but she was new to it, and did not answer to my call, and I saw we must go down; but as the boar passed I had time to drive my spear with all my strength behind his shoulder through the heart. Simultaneously there was a crash, a noise of splintered wood, a sensation of falling, and I remember no more.

I woke up, and found myself lying on my back with my helmet over my eyes and bashed in, and when I could look round I saw that the boar was lying dead close to me, with half the spear through him, from one side to the other. A little farther on the poor mare was standing in a little pool of blood, with the other half of the spear through her neck. It had entered from below and penetrated upwards, passing through the muscles of the neck and coming out through the mane at the top, with the jagged end of the bamboo all flattened out like a rose by the mare's weight as she had fallen over on to it in her somersault.

My wife and my friend soon came up, and in their bullock-cart were water, bandages, and restoratives, which are so frequently needed in these hunts that they invariably form part of the equipment. We took out the broken spear from the poor mare's neck, stopped the bleeding, and made her comfortable. After a drink of water and a good rub-down, she was soon busy with her nose-bag, and in a few weeks she was all right again.

What had actually happened was this. As I leaned over with my spear down, and drove it through the boar, he carried it across the mare's forelegs, snapping it in two, taking one half with him, and leaving the other half in my hand. As I fell on to my head, this portion of the spear, which had a large lump of lead at the butt-end of it, fell out of my hand, and the leaded end naturally reached the ground first, with the jagged end standing upwards for a moment. In that moment I must have fallen clear of it, but it caught the mare in the lower part of her neck, and came out at the top, just missing the jugular vein, and passing through the muscles only. It was a great escape for her, and the broken spear could not have been far from impaling me.

I killed many a boar off that mare afterwards, and she was never in the least timid. Doubtless she remembered the necessity of inclining to the left at the critical moment, for she never let a boar cross her again. Nor did I ever ride again with a leaded spear.

THE HOME CALL.

PART II.

IV.

IT was the following summer. A boat lay rocking gently off the Runnel Stone. A mile away over the sea, Porthgwarra creek and fishermen's houses shone in the August sun. In the boat a solitary boy leaned over the side, fishing intently. The bell on the Runnel Stone chimed softly from time to time as a gentle swell rose under it.

For more than an hour the fun was fast and furious. Bream, pollack, and an occasional gurnard seemed to swallow the bait as soon as it was let down. The boy could hardly haul his three lines in and rebait fast enough. Then, all of a sudden, the fish stopped biting. After a few minutes more he pulled his lines in, flung himself on the seat, and took the oars.

'I hope Tom Jackson won't get ratty because I took his boat this morning,' said Jim to himself as he swung the prow round towards the Cornish coast. 'He told me not to go out without him. But I couldn't find him anywhere in the village, and there was the craft all afloat and ready, lines and all. The morning was too ripping altogether to waste. Time to get back, though, now. Old Lance ought to be turning up from Penzance time I get back.'

But was the morning quite so ripping now, after all? There was a bit of mist hanging about surely, and the land seemed a mighty long way off. What of the set of the tide? Tom Jackson was always talking about it and the race, Jim suddenly remembered. Nasty thing a race must be. He had been fishing a bit too long, perhaps, and was rather fagged. Why did Jackson keep such heavy boats? Hang that mist! Where *had* Porthgwarra creek got to? And that beastly bell—he was sure it couldn't be where it sounded. Anyway, he was getting some way on the boat now. There was a regular bubbling at the bows. Confound that big, ugly brute of a goggle-eyed gurnard! Why hadn't he stunned it properly? He couldn't leave the oars now, though. Yes, there *was* a current, certainly. If it took him down Porth Curno way he would be late for Lance. That was a bore. But he must go with it, that was clear. Was there a decent landing anywhere under Porth Curno cliffs? Tol Pedn, of course, was hopeless, and as dangerous as could be. But he didn't much think he was being swept that way. If he got southward beyond Porth Curno bay, weren't there some sandy beaches at low-water towards the Logan? But was it low-water?

Jim tugged manfully at the oars. But the remorseless rush of the tide had the boat in its grip. Three grown men would hardly have stemmed it. What could a lonely, weary boy of fifteen do against it?

There! Down came that cursed sea-fog again, thicker than ever. Was that the noise of the waves on Porth Curno beach? . . . .

Ashore on Porthgwarra Terrace an older boy stood fretting. Here was the fog come down, and he could not see Jim through the glass any longer. Jackson looked mighty grave just now when he came back. There he was, strolling down to the creek where the other boats were, through that congery tunnel. Should he follow him? Or should he go along the cliffs Logan Rock way? Jackson said there was a run of the tide that way when it was making. Yes, that would be best.

Lance started off along the cliffs at a great pace—past the little granite church of St Levan and its graveyard, where the shipwrecked mariners rest, up to the next headland he hurried, and to the Porth Curno signal-mast beyond.

'Yes,' said the signal-officer, 'there is a strong race just now to the eastward. You never can tell exactly, year in, year out, what these tides will do. Your friend alone out there! Let's hope he is back by now. If not——' He shrugged his shoulders and gazed out seawards. 'Much too thick to see,' he said.

Lance started running to the extreme tip of the headland. There he flung himself on his face on the short grass and peered over. Was that something white, far down there in the water?

v.

Jim was dead-beat now—no doubt of it. His hands were a mass of blisters. As for thirst! Here was the land at last, though. He could just see it through the mist. Deep water up to the very base of the cliff. He must let the boat still drift along a bit. What a pig of a swell there was just here!

As the boy rested he held the oars loosely in his sore hands. A green, silent billow knocked them out of his cramped hold. Loosed from their thongs, they went floating away, and were lost in the mist almost before the startled boy had recovered his balance.

Oh, the oars gone now, were they? That pretty well settled it. Did the currents run right inshore? Or was he bound, say, for the Wolf? If only the fog would lift for a minute! What was *that*?

There was a sudden swirl in the water, the glimpse of seaweed, a sucking eddy. Crash the boat came down heavily on the jagged edge of a rock just beneath the surface. The sea came pouring in.

Well, he must swim for it now, at any rate.

As the boat filled the boy hastily stripped, kicked off his shoes, and dived into the sea. He swam cautiously along the base of the towering line of cliffs.

No handhold anywhere for twenty feet above sea-level, and no bottom either. The current had him, anyway. The mist seemed lifting a bit. How long could he keep afloat? Once he had done about a quarter of a mile, he thought it was, in the Thames. But he wasn't so tired to begin with then. Was it really any good going on swimming? The water was jolly and warm. How if he——?

Drowsily he stopped swimming. His eyes half-closed. His body began to sink deeper and deeper in the green water. From the top of the cliff there rang out a clear call on a whistle—a sharp, peculiar call.

That must be Lance on shore, then. It would never do to give in with Lance there.

The swimmer struck out again, feebly. Was that Lance coming down the cliff? Why had he his whites on, though? Pretty green they'd get if he slid at that pace. Ah, he remembered, there was a bit of a ladder down that last fifty feet to the shore there. Could he get as far as the bottom rung? Lance would hoick him up the rest. . . . .

Lance's clothes lay on the cliff sward above. Down the ladder he himself came at furious speed. From near the bottom of it the boy half-fell, half-dived into the waves. Two dozen strokes, and he had gripped the other and towed him to the ladder's foot. By sheer strength he hoisted him out of the water, and shoved him with his shoulder rung by rung up that weary

length of ladder. At the top of it he picked him up, and staggered with him up to safety on the grassy slope above. There both boys fell exhausted at full length.

Presently Jim sat up and grinned. 'Jolly sick Jackson will be about his old boat,' he said. 'I say, Lance, I thought you were in whites when I saw you coming down to me. Your old Home Call bucked me up no end. Now, are you going halves in those clothes of yours, Lance?' he continued. 'We must get back somehow without scaring the village to fits. You might stand me a shirt, anyway.'

VI.

A young khaki-clad officer lay on his face, snugly ensconced among protecting rocks, and swept the waste of desert in front of him with his field-glasses.

It was the afternoon of the second day of the retreat. The sun blazed down fiercely. The two platoons detailed that day to cover the withdrawal of the small force were having anything but a restful time of it.

Chased like red-shanked partridges, reflected the youth; and where his men were at that particular moment, Heaven only knew. Scattered in open order over a mile or two of that God-forsaken country, he supposed. Anyhow, all who were left alive were well over the low sandy ridge in his immediate rear, he was sure of that, and not another man shared the risk of his delay here for a few minutes. Everett of the other platoon had the whole lot well in hand. Hang it all! where *was* old Lance? The silly beggar was always lingering, stopping to let him, Jim, draw off his own men first, he knew, and saying all the while that he must have one more pot-shot or two at the pursuing Arabs. Now, *was* that laid down in the regulations for scout officers? Not a sign of him! He, Jim, was as jumpy as their patrol leader, David Wynnstay, had been—so the other boys told him—that summer long ago when Lance and he had lost themselves on the Welsh hills. It was David's fault, though. David knew the way, and he ought to have waited for the pair of them. He only wished *he* knew the way back to camp at Beersheba. Those Welsh hills had points about them, though. At least there was plenty of water in them—sometimes a bit too much. (Jim grinned at the recollection.) What was the state of his water-bottle now? Two inches of brown fluid, mostly mud. Ugh! What a weird fellow Mr Purun Dass had been! Of course it was a faked name. He knew it all along—but he wasn't so well up in Kipling then.

Where the deuce *was* Lance? He had done it this time, and no mistake. There wasn't a soul in sight. Yet those wily Arabs were creeping round on both flanks all the while, he warranted. If they were creeping round twenty flanks, he was not going back a step farther without Lance. What *had* come to that temerarious beggar?

Hullo! There was a shot, and, yes—curse that mirage!—yes, it *was* a figure coming his way. Not crouching, though, nor taking an inch of cover—just stumbling along. Now, *were* they, he asked you, taking a stroll over the Wiltshire Downs? It was swerving off now to the left. Lance, he was sure, and something wrong with him, so far as he could make out. He must venture their Call again, Arabs or no Arabs.

Jim blew their pet Home Call softly on his whistle; then once again, a trifle more loudly. The distant figure turned at the sound, and came staggering towards it. Then on a sudden it fell prone.

Second Lieutenant James Ranold of the Oxfordshire and Buckinghamshire Light Infantry and the Palestine Expeditionary Force leapt up from behind his boulder and ran at top-speed to the spot. Lance lay there senseless, blood oozing from a wound in the shoulder. In vain the other tried to stop the bleeding. He propped him up against his knee, and forced the last trickle of precious water between his lips.

Lance's eyes opened, and he smiled up at the face bending over him. 'Misty, Jim,' he whispered; 'all thick mist again. It's frightfully dark and cold here on the mountain-side. But I heard you. I heard the Call.'

His head fell back; his eyelids dropped. Jim knelt by his friend's dead body in the full rays of the declining sun.

Another shot rang out. Jim sprang to his feet. 'The Home Call, Lance,' he cried. Then he, too, fell dead by his chum's side.

VII.

The shepherd, now five years older, sat dozing over the flickering red embers of his peat-fire. All that night white mist had wrapped the cottage round with soft eddying waves, and the wind moaned, sobbing round the house. His aging collie lay stretched out on the hearth, slumbering uneasily. On a sudden the man sat up erect, a curious light in his eyes. 'Come in, lads!' he cried.

Through the open door came in two boyish figures. They moved noiselessly towards the hearth, dimly visible in the light of a small spurt of flame from the dying peat. The dog still slept, but its tail beat faintly on the floor.

'Tell him, Lance,' whispered the younger of the two.

'We have come to tell you, sir,' said the other in clear tones, 'it has happened as you foresaw. The mist is cleared away. We are off duty. The Call Home has come for Jim and me.'

The boys faded away. The shepherd sprang up and went to the door. In a clear sky the moon was sinking to the west. On the mountain-tops there shone the first golden glow of dawn.

THE END.

SOME FLOWER NAMES.

By William Gillespie.

In the interesting article which appeared in the October number of *Chambers's Journal* on 'The Science of Plant Names,' the author states, with regard to the foxglove, that 'it has never surrendered the secret of its etymon.' This, I hold, is not the case. The plant in question is one of a large number which are popularly known by names involving reference to some animal, or to what appears as such. Occasionally this animal-element in the name is appropriate to something in the character of the plant, but in many cases it is so completely irrelative to anything in the plant itself, its locality, and its uses that it is necessary to look for other reasons for its application. In these latter instances it will be found upon inquiry that the animal name is a corruption of an early term with an altogether different signification from that which it has to-day. The foxglove is a case in point. It is simply the red-glove, or red-gauntlet, for fox or foxy does not apply to the fox, nor is it a corruption of folk's glove, the glove of the little folks or fairies; it means tawny or red, as the Latin *fuscus* and Italian *fosco*. The plant received its name from its colour and its shape.

The toad-flax (*Cymbalaria linaria*) is thus named from the appearance it presents of a multitudinous mass of threads (flax) matted together in a cluster or bunch, the name for which in Old English was 'tod.' It is to be found in many old dictionaries, and is from 'tot' or 'total,' a mass or assemblage of things. So also the toad-pipe (*Equisetum arvense*), which consists of a cluster of jointed hair-like tubes, and the bastard toad-flax (*Thesium linophyllum*), a plant with many clustering stems. Louse-wort (*Pedicularis palustris*) seems to be simply a corruption of loose-wort, the plant being otherwise known as the red-rattle, from its close resemblance to the yellow-rattle, the seeds of which, being loosely held in a spacious inflated capsule, may be heard to rattle distinctly when the ripe, dry seed-vessel is shaken. Buck-bean (*Menyanthes trifoliata*) is in reality bog-bean, from the fact that it is always found in wet bogland. Swallow-wort, or celandine (*Chelidonium majus*), is more properly sallow-wort, the name being given to it because of the dark, yellow juice which freely exudes from its stems and roots when they are broken. Horse-radish has nothing to do with a horse, but takes the name from its excessive pungency, the word 'horse' used in this instance being derived from the Old English *curs*, or the Welsh *gwres*, meaning hot or fierce. The horse-chestnut has received its name from the same word, as it is hot or bitter, and thus differs from the edible chestnut, which is sweet to the taste; and horse-mint also is pungent and disagreeable to taste and to smell, as compared with the cultivated varieties of mint.

The sow-thistle, which is not a true thistle, has the latter part of its name from the thistle-like appearance of its leaves. When these are handled, however, they are found to be perfectly harmless, and incapable of inflicting the slightest puncture. They are formidable to the eye only, being quite soft; hence the old name sote or soothe thistle—that is, soft thistle, an apt name for the plant. The duck-weed, that small, round, leaf-like plant which covers stagnant pools and ponds with a dense growth of green, is simply ditch-weed. Its Latin name, *lemna*, confirms this, derived as it is from the Greek *limnē*, a stagnant pool. Coltsfoot (*Tussilago farfara*) may be derived either from cough-wood or cold-wood, in accordance with its Latin name, which is derived from *tussis*, a cough. Pliny states that it had been in use from remote times, even in his day, for curing colds, the fume of the burning weed being inhaled through a reed; and the belief still prevails in country districts. One is inclined to conclude that the name has been derived from its medicinal virtues, rather than from its resemblance to a colt's foot. That name was probably given to it at a later period.

There are many other animal-named plants, such as crane's-bill, larkspur, mare's-tail, mouse-tail, adder's-tongue fern, stork's-bill, and hare's-tail grass, which are more appropriate, and have a more apparent connection with the animal whose name they bear than those above mentioned. Beyond a doubt the study of plant names is an interesting one, and is worthy of more consideration than is usually given to it.

MAY-TIME ON THE BEN-Y-VRACKIE SLOPES.

Away by Ben-y-Vrackie
Sure, there's the Rainbow's End,
Where, hidden well by magic spell,
Lies gold that none can spend:

But, oh, by Ben-y-Vrackie,
The fairies recklessly
Make fond display each year in May
That those with eyes may see!

Yes. Down by Ben-y-Vrackie
The wild broom flames to-day.
Treasures of gold the valleys hold:
It's always so in May.

And though by Ben-y-Vrackie
Soft rains soon quench the blaze,
There's some that dream long by the gleam
Of fairy-golden days.

SEVENTH SERIES

THE HEART OF THINGS.

By Henry Leach.

LONDON, *Yesterday.*

IN Germany now there is a man of secrecy and force who stirs the attention, the curiosity, the anxious speculation of very influential elements in care-worn Europe. Enormously wealthy, he possesses quite remarkable faculties for business and high finance, and an energy, equipped with elusiveness and cunning, to exercise them well. He is a picker-up of threads of political and economic power wherever he may find them loose, or may cut them loose for his new picking. He is controlling coal, ships, newspapers, and other commodities that matter most; he is dominating in vast quantities money other than his own. From his youth he has dreamt brilliantly and with breadth, devoting himself, like a good German financial chemist, to the conversion of his films into facts. Some of these films of dreams he described to bankers when he was needing money, but they smiled upon him. Yet nearly all his fancies have come to material and profitable substance. Now he is imagining more expansively, more daringly, than ever before, and it comes to pass that fancies to which, in other times, no more attention might be given than to the babblings of a fortune-teller are being much and seriously considered in London, in Berlin, in Paris, in New York, Moscow, and other cities of various concentration in effort. He would form a syndicate of nations—'Europe, Limited,' one might call it—with himself apparently as its chief director, for the restoration and exploitation of Russia, that she might regain herself—incidentally—and might the more assist the stricken Powers of Europe, Germany especially, to rebuild their fortunes and economics. Likewise he has been fondling a scheme, shrewdly planned, carefully considered, for the reshaping of Germany herself; he would, with the assistance of some foreign money, take over, in the way of private enterprise, her railways and other affairs, now held by the State, and would conduct them for plain profit-making to the end, as he suggests, that Germany might the better be enabled in this way to deliver her dues to her quondam and somewhat anxious foes. It appears that much money from the outside world is needed for such grand thoughts as these, and lately the thinker came to London, and in the city which is still the richest called upon the most important persons, being received with much consideration, and his schemes discussed. He has interests here, interests at Cardiff, interests at Newcastle, and in other parts. Strangely secretive and elusive is this man. When he was in London, with the newspapers guessing intensely, but with little accurate effect, why he made the visit, it was caused to be announced that the Premier would be pleased to see him did he but intimate his desire to see the Premier; but he did not. Having moved stealthily among great financiers in the City only, he crept secretly back to Berlin when his work was done. For long ahead Germany must needs think more of business than of battles; she recognises the necessity, accepts such an inevitable consequence of her errors with a certain willingness, and adapts herself as speedily and efficiently as she may to the new and puzzling circumstances. Thus the Hindenburgs and the Ludendorffs recede, and the industrialists, the financiers, advance. He of whom we write is not only the chief of these, a formidable and impressive emblem of the new period of desperate—yet, as Germany sees it, by no means hopeless—struggle; but an uneasy feeling awakes in other lands that he may be the most considerable entity of his rare kind in either hemisphere. There are many far richer men, but it is difficult to name any of such substantial richness who is at the same time so fecund in industrial and commercial initiative, so fiercely energetic, so persistent and determined, so seemingly resolute. He is very practical. He is a believer in the still tongue, the watchful eyes, the ready ears, but most the silent tongue. His genius plays in the selection of men for his assistance. He covets a peculiar political power, and is gathering it, but not in a personal sense, for himself; something of a certain unusual patriotism enters here. For social distinction, that which so often saps the energies and capacities of men newly risen to great wealth and power, he has no taste, and in this he may be blessed. He covets no publicity; he is less mentioned in the newspapers because they can gather little news of him. This man seems to stand for a future Germany, good or bad, as does no other, high or low. In that sense the remaining world regards him most

 [*All Rights Reserved.*]

circumspectly as one of the powers in the grand economics of the sphere. Some have called him the Bismarck of the new Germany, but it is not an accurate idea. His real name becomes increasingly familiar. It is Hugo Stinnes.

* * *

In looks and ways, what kind of man is he who, in the mystery with which he wraps himself, is fancied to be practising a new kind of financial alchemy, preparing potions called by the name of schemes by which he may work Germany — Germany with a few associates, Britain for choice; may work Russia, and from that wasted, maddened chaotic mass produce the piles of sparkling riches with which his country shall pay France her reparations, and then advance on her industrial way again? And on and on, until . . . What is Hugo Stinnes aiming at? Men murmur in places that no man like him could conceivably mount up the power of wealth that he is doing without a certain object; they say it would be too unhuman for any living thing to strain the effort beyond a given stage. Perhaps it might be so. There are some who with a certain awfulness sometimes whisper 'Kaiser'; the miserable William is mentioned in many connections in Berlin now, harnessed by name with various forlorn and fantastic hopes. There is a suggestion that when the time is good for it, if ever it should be, Stinnes may finance the politics that work and aim at restoring the regality of the Hohenzollerns, even as now he is an element of great political power, and exerts himself most forcibly in many ways, though he makes no public speeches, appears rarely on public occasions, yet is sometimes seen in his place as deputy in Parliament, though he does no speech-making there. But it is indicative of the power and influence of the man, and his manner of their exertion, that when he is present, or when he is not, others, his associates—his dependants one might call them — men who bank their prospects not alone upon his present position, but the greater one to come, voice in this German Parliament not just their own thoughts and ideas, perhaps not their own at all, but those of Hugo Stinnes. That is often said. They state his case, and some may play with variations of it, to mark the effect upon the assembly and deduce accordingly. Stinnes listens and determines. It is his custom in business to permit all about him — colleagues, assistants, technical advisers, and others—to perform the speech while he, inscrutable, pencils an occasional note. His peculiar mind is probably making rapid and intricate calculations involving the vastest sums of money and changed economic and industrial arrangements; he may reach solutions that those about him could never gain with all the toil of hours among the mathematical fantastics. Then, at the end, he speaks, but only to announce his determination; and the words are few. His plan, sensational it may be, is promulgated; there is silence, and the gathering dissolves. He is always calm, inscrutable, mysterious. He has nought to do with the mere political firebrands, fanatics, and humbugs whose names are printed in the newspapers every day, and whom the less sophisticated readers everywhere seem to regard as powerful human entities, though they are often powerful only through political structures they have raised about themselves, and intrigues they assiduously exert to keep them taut and firm. 'Tis said that Hugo Stinnes holds an idea, if circumstances are suitable, as they may not be, of helping the Kaiser back. Some may find it difficult to believe entirely that such a keen super-business man could let such fancies stray, but we are invited to remember the opposite thing to Kaiserdom, which is indicated to be Bolshevism, and in a general era of Bolshevism where then would be Hugo Stinnes and his millions? But it is suggested that if he could support his soaring capitalism with a reformed monarchy, backed by the people—his idea, so it is said, being the Kaiser and people's party—there might be a security not to be obtained in other ways.

* * *

There is an odder view of Hugo Stinnes. Some, in a half-mystical manner, suggest that this man is like an exaggerated figure thrust out by invisible powers of infinity as an emblem, grotesque in its proportions and pretensions, of the materialistic vanity and egregious madness of a world that through 'progress' has lost its way. He is unknown for acts of charitable donation; nor is he a 'patron of the arts' or of what is only beautiful and lovely, yielding grace to raw existence. Yet here there are two points to be placed for Mr Stinnes. One is that to be an open 'patron of the arts,' according to a phrase found on monuments and tombstones and in official biographies, is perhaps to be a super-prig, with probably no honest liking for what is lovely, since true love of art must be unselfish, and thinks not of being 'patron' or of phrases cut in marble. The second point is that if he held desires of benevolence or the will to do good, as the saying is, in some form, he would act upon the will, and, acting, would wrap his work in folds of mystery like all his acts besides. So for fairness we should not be swift to mark a negative against the character of this Stinnes in the matter of generous assistance to humanity. However, such as hint that in some manner he falls upon us from a misty void say it may be that he was hurled on to our distracted planet as a sign, a wild, fantastic exaggeration of the sadness and the failure and the stupidity of our materialism and too vulgar earthly aim, and that, with his personal fortunes and works at the gleaming climax of their triumph, when it

might seem he could nearly master all, the whole of this sorry scheme of so-called civilisation shall collapse, and in the morning there shall be left but whitened cinders of it all on black-burnt earth. Thus he should furnish the ultimate catastrophe of the tragedy of Earth, as played from the beginning in a thousand million acts. So some temperaments may figure it, but it is rather flattery for Mr Hugo Stinnes. There are few romanticists in Germany now, and there were hardly ever so many as in certain other lands, but some of them have pictured naturally further streaks of glory about the ultimate destiny of Mr Stinnes. In the general world discovery follows upon feverish invention now; the heavens seem uneasy, judging by most capricious weather and the seemingly erratic adventures of the planets, and Earth appears too small as business premises for its occupants today. Such romanticists may suggest with smiles that Earth shall come to link with Mars or some other planet, and then shall be ample scope for exploitation by Mr Stinnes.

* * *

He is a somewhat short and thick-set man, with black and close-cut hair, moustache and beard to match. The complexion is sallow, the nose a little hooked, and his general appearance, including a certain penetration by the eyes, suggests to many that he is of the Hebrew race; but it is not so. Those eyes, assisted by paleness of the face, the slightly drawn expression, hint at weariness, an effect of strain; but when engaged in listening to what is important to him—and he listens to nothing else—they gleam and sparkle. He is now fifty-one years of age—perhaps he looks it, but no more—and in general he is a healthy man, for otherwise he could not labour as he does. He wears a plain black hat of the bowler type, and dresses invariably in a simple suit of black which is believed unquestionably to have seen better times. Probably he has two or three suits of this kind—or it may be ten—each of which by characteristics suggests that it has seen better days; but the impression given to those who observe Herr Stinnes from time to time is one of the plainest, most unpretentious, and even slightly shabby sartorial continuity. Overcoat to match. An even weaker point is an apparently made-up black tie. Altogether a man who needs to be what he is to carry himself with such ostentatious carelessness, but, being what he is, may be the better for the way. The diamond-decked millionaire was never a success; even the cheapest kings could beat him every time. Mr Stinnes keeps out of rags, but he is on the romantic side. And seeing him emerge from his hotel some morning in Berlin, one would suspect that at morn, when the heart is at its best, there flickers through this strange being some emotion of the simpler and unfinancial kind. It is an echo, perhaps, of a former self now reincarnated, or a faint stirring in the depths of his nature of some romantic family infusion of his blood, caused by the new sense of life and action or by something he may have thought or glanced upon. For he comes forth from the Hotel Adlon with a spring in his step, his hat a little tilted to one side, a hand in a trousers-pocket, quite a jaunty fellow, and perhaps, withal, a twitch less of the pained look upon his face. That is Mr Stinnes at his human best. The Adlon is the main general headquarters of this man who spreads his tentacles over all the business world, who has just opened a railway-carriage factory at Java, and is ousting Dutch firms from their own colonies; who is buying shipping in many countries (one hears of his purchase of seven Swedish liners); and who, however much any one may deplore the existence and procedure of such persons, is beyond doubt the possessor of the long and unrestrained imagination that, when applied to finance and commerce, raises him above the others, and makes him a formidable entity in the consideration not only of Germany, but of the world complete. The burden he assumes is colossal, and that is a thin adjective for it, but the best at hand. Others may imagine and scheme more, but usually they have an instinctive feeling of timidity, a sense that such would or should be beyond mortal capacity, that responsibility would be too oppressive, and that it would seem like a challenge to humanity—nay, even to some diviner scheme of things. Now and then, once or twice in a generation, a man with full imaginative equipment strides along who is unafraid, and then the world may pause. Once an achievement, a new reach of imagination, has been explored, and the possibilities have been demonstrated, it is easy to cover the same ground again. It is the initiative that tries and tells. Hugo Stinnes has gone farther than others, and he has reason to be of solemn mien, to live a simple life, and to forget the trifles of attire. After all, a greenishness of jacket is a small thing beside taking over Russia and her conversion into a going and a new concern, run by the rest of Europe—to make money for payment of German debts. A hole or two in garments would hardly lessen the interest and consequence of such a scheme. And, as to holes, a cynic inquires upon the situation in which such a man as Stinnes might be found in the event of the gold and other money standards—which, after all, are purely artificial and a world convention—being abandoned, as is the bad dream of financiers on their most distressing nights, Bolsheviki croaking about their uneasy pillows. The world social and commercial system of humanity has been so much established on the money standards that their abandonment for some other system of exchange and barter is scarce conceivable; but yet it is possible, and the discoveries and elucidations of chemistry make it not less so.

We believe no longer in many things believed in once, and the absolute finality and inimitability of gold cannot now be more than a most limited belief. Pearls and diamonds fall into like suspicion. Who knows? Who can tell? But not in our time perhaps. Yet it was only the other day that we heard, from Germany herself, a report of means being found for the making of artificial gold, which seemed quite the proper gold, and the scientists of the world could not in their consciences dismiss the story with mere contempt. However, if there was an upheaval in the business affairs of Mr Stinnes upon such a happening, so also there would be the same with all of us, and in the long-run it is to be doubted whether we should emerge from the ordeal better than this German. He has a problem at hand in these days which gives him a certain training in the manipulation of the exchange of his country's money with that of other states, since the mark, so much stricken in its value, is practically outside the general system. Mr Stinnes has a capacity for delivering himself from holes. His first great experiment was in the early stages of the war, and his second in the corresponding stages of what was called the peace, and he did well both times. This man, who in his youth once worked down a coal-mine, and who was worth two million pounds before the war, is said to have multiplied his fortune ten times or more since then.

* * *

Smiles must not be sought upon the countenance of a man like this, and you do not see him smiling as, with a considerable staff about him, he enters the restaurant of the luxurious Hotel Adlon, which he does most nights when he is in Berlin. There seems something peculiarly ceremonious about his entry into the dining-hall. He is usually a late arrival; many of the people are nearing the end of their meal before his party with solemnity enter and proceed to the little alcove, where, in a semi-mysterious separation from all the rest, they eat—and that sparingly, for it is untrue that this Stinnes, as some have suggested, is a trencherman of the Bismarck kind. He does not look it, and his body and mind would not allow it. His various confidential assistants advance in this informal procession, a secretary commonly bringing up the rear with a portfolio full of papers. This conversion of the luncheon and dinner periods to a sort of business rite is something of a custom with some of the keener Germans. One might speculate at times upon what this solemn money genius might be like in a domestic home, whether at last some family warmth might miraculously exude from such a cold financial composition. It may be so; but if there is a Frau Stinnes alive, one does not hear of her. Yet the genius of this story has four sons, and one of them, being the eldest, Hugo, is being trained in the way his father would have him go, the Stinnes way he has invented. But two of a kind like this do not live in successive generations. His only intimates are those few people of his general staff. Most carefully picked men they are, for Hugo Stinnes has the characteristic of real rulers of men in that he can select his generals with rare circumspection. Among his staff are certain keen and also silent men who were Intelligence officers in the German Army; the chief of them is a genius who was once attached to the Luttwitz corps. One of the rules imposed upon them is that neither in conversation nor in correspondence shall they ever mention him, Hugo Stinnes, by his name; he is always referred to as 'The Principal.' One time in the past a mouse, seized with much courage, dared to bring a law-suit against the giant Stinnes, and fought it with a fine energy and ability. That appealed to Stinnes, and he took over the mouse—just a little man—to make a manager of him, by which he gains more than he would win through a hundred cases at the law. These solemn men sit long at their table; they talk most seriously of countries and many millions. A secretary takes notes unceasingly. At the end they rise, and the procession passes back towards the private apartments of the man who thus juggles with the labour of the world and some of the fruits thereof.

AD NIGERIAM.

(TWO SONNETS ADDRESSED TO THE WEST COAST.)

I.

I SOMETIMES think that I have trod this earth
  In the dim past, as heir to some small state,
  Where all things wild and strange did congregate;
Where mighty pillars of assuring girth
Upheld the palace of my princely birth;
  But the unpitying mastery of Fate
  Sent me to death, a child immaculate,
And guessing little of life's magic mirth!

There flowed the river I now love so well,
  Where I, unfashioned, immature, ungrown,
  Floated at will, a dreamer, all alone—
Learning the secrets that the rush could tell. . . .
Ah! my dead past, it was inevitable
  That I should love again the scenes once known!

II.

For love that counts the years on Time's bead-frame
  Gave me a passion, wonder-tinted, red,
  Came to me in Memory's guise and said,
'Thou *know'st* this land—hadst guessed its very name,
Its magic, mystery, beauty, brilliance, blame
  At first glad greeting, when its kiss was shed
  Upon thy heart, thy lips, thy down-bent head,
And all thy soul leapt forth in sudden flame!

'Give thanks, O Mortal! Patient Memory,
  Imperfect, hesitating, lends its gleam
  To keener intuition—for in thee
The splendour of blue sky and wandering wave
Has lived beyond the oblivion of the grave,
  To lend th' imperishable rapture of a dream!'

J. M. STUART-YOUNG.

THE THUG.

By Peter Carpenter.

I.

THERE is a department of the police-detective service in India which deals with Thugs and Dakoits. Thug corresponds to the term footpad or highwayman in English; Dakoits were armed bands of robbers who attacked and looted villages.

For many years prior to the Great War, Thugs and Dakoits had ceased to exist. Captain Sleeman, some twenty years before the Mutiny, traced and exposed the ramifications of Thuggism; while the Arms Act practically put an end to Dakoiti.

In most countries murders are committed from motives of revenge, or for pecuniary gain, but not for mere lust of shedding blood, except in some exceptional cases where the culprit is insane. The Thugs, however, had a love for murder. They plundered their victims, and usually selected wealthy persons for their prey; but the poor did not escape. An old man, whose worldly possessions consisted of a cotton-stuffed quilt and a brass drinking-vessel; a pilgrim dressed in saffron-coloured cotton clothes, on his way to bathe in the sacred river Ganges at Benares, or to visit some other sacred place, who carried no money, but depended on charity for his food; even children and others from whom there could be no expectation of profit—all these were strangled by Thugs.

The Thugs worshipped a Hindu goddess, known by the various names of Kali, Devi, Bhagnavi, and Durga: the wife of Shiva the Destroyer. In ancient times human beings were sacrificed in public to this goddess. That a fanatical Hindu votary of the goddess of destruction should consider the sacrifice of human blood as a meritorious act is comprehensible; but Mohammedans also belonged to the cult of Thuggi, and it is difficult to explain the worship of idols by followers of Mohammed, many of whom read the law in such a literal manner that they consider even the making of a picture of an animal or a man as an evil act.

The Thugs were not all poor men. Some members of the fraternity were wealthy merchants or shopkeepers, men of standing and respect in their native town or village. Some were of the agricultural class; others were carriers, accustomed to transport merchandise between large towns and neighbouring villages, and as they were well acquainted with the merchants, and knew the roads, the tracks, and the wells, their knowledge was useful to the Thugs. Government officials were also to be found in their ranks. At investigations and trials, their assistance was available in favour of their comrades.

Besides the Thugs, there were other thieves and robbers on the road; it was usual, therefore, for travellers to journey together for mutual protection. The Thugs availed themselves of this fact. Some of the band would join a party on the road, explaining that they were afraid of robbers, as the country had a bad name. The strangers welcomed this addition of strength. These spies would then send word to their chief, reporting the number of persons in the party, how armed, the number of servants and guards, the quantity and nature of the merchandise, and whether loaded on carts or pack-animals.

The leader then made his plans as to the number of men he required, and the place where the ambush should take place.

On one occasion a band of Thugs joined a rich merchant, who was journeying with valuable goods, protected by some well-armed and trusty servants. The transport was hired from professional carriers; but often these carriers were in league with robbers, or were even Thugs themselves. Numerous armed servants were required, not only to guard against danger from without the camp, but also against danger from within. The chief of the Thugs was a man with a charming manner, well dressed, and evidently of rank and position. He explained that he was proceeding on a diplomatic mission, from one Indian prince to the Court of another. On account of his rank, and also because he was carrying several valuable presents, it was necessary that he should have a strong and well-armed bodyguard.

The merchant was pleased to meet such a well-bred and agreeable person, and suggested that they should continue their journey in company together. The stranger beguiled the weariness of the road with tales of his adventures and of life at the Courts of Indian princes.

At sunset they arrived at a spot which was a recognised halting-place for travellers. The servants arranged shelters for their masters; the cooks lighted fires and prepared the evening meal; the water-carriers drew water from the well; the cart-men fed and looked after their cattle. Except for the followers of the merchant and the stranger, no other people were spending the night at that place.

It was growing dark when the two newly formed acquaintances sat down to dinner. They were tired and hungry, and while chatting together did full justice to the various dishes

which were set before them. When the meal was finished, the stranger called out in a loud voice, 'Bring hookahs.' The robber who was standing near the merchant threw the *rumal*, or scarf, over his head, and with a swift motion of his wrists drew it tight round his neck and strangled him. At the same instant another Thug, in the same way, throttled the merchant's servant. Other members of the gang fell upon the cart-men and servants. The whole business did not occupy more than a few minutes. The dead bodies were hastily buried in graves which had been dug beforehand. The valuables were divided, and the thieves separated and dispersed in various directions.

II.

At all Government offices in India one meets the *peon*, or *chaprassi*. Sometimes he wears a scarlet coat—that is, when he is the servant of some high official; more often he contents himself with a scarlet shoulder-belt with a brass plate engraved with the title of his department. He is the doorkeeper and messenger. The pay he receives is small, equal to the sum a scavenger or a water-carrier obtains; but the *chaprassi* has means of augmenting his monthly pay, and the authorities, being acquainted with this fact, take it into consideration when fixing his wages.

When an Indian gentleman calls on the district officer, he encounters the *chaprassi* in the veranda of the office or the private house. Before obtaining entrance to the presence of the great man, the *chaprassi* must be propitiated; otherwise the visitor may be kept waiting with poorer applicants, and so receive injury to his *izzat*, or dignity. Even the poor must pay toll before they can present a petition.

Devi Ditta was such a one. He was head *chaprassi* to Mr Saunders, the collector or chief civil officer of Basoda, a small station in central India. At that time the electric telegraph was unknown, and the railway non-existent. The district under his charge was an extensive one, and as there was a lack of communication, he was not much interfered with by his superiors, and governed his people in his own way. The country-people knew that there was a Queen in England, and a Viceroy at Calcutta; but they never saw these high dignitaries, while Mr Saunders was present on the spot and accessible. The poor came to him with their grievances, while the rich consulted him regarding the state of their villages or lands, or on more private matters. It was truly a patriarchal form of government.

Devi Ditta was always present at his post on the veranda. He met many people from the outskirts of the district, and by methods of his own gained a knowledge of their rank and wealth. An Indian has the bump of curiosity well developed. He likes to know all there is to be known of a person he meets, the place where he lives, what his occupation is, and how much money he has. But it was not from idle curiosity that Devi Ditta made these inquiries—he had an object to attain.

One day a gentleman, of good appearance and well dressed, appeared, accompanied by a body-guard of armed and mounted servants. Devi Ditta was told to introduce Suraj Mull, a *zamindar*, or landholder, to the collector. Devi Ditta got into conversation with the servants, and learned that Suraj Mull was a rich man, the owner of several villages near the town of Dhuma. Now it happened that a certain Mulraj, a fellow-casteman of the *chaprassi*, lived at Dhuma. A message was promptly sent to Mulraj asking him to come to Basoda, as Devi Ditta had an important communication to make to him.

Before many days had passed, Mulraj arrived. After the usual salutations and inquiries as to the state of his health and the well-being of his household, Devi Ditta said, 'Brother, some nights since the goddess Kali appeared to me in a dream. On seeing her terrifying appearance, my liver became like water. I trembled and shook before her. In an angry voice she addressed me. She asked why I had been remiss in acts of worship and in sacrificing to her, and warned me as to my future conduct. To escape disaster I was to present her a worthy sacrifice. Brother, since that vision I have noted all visitors to the collector-sahib. When Suraj Mull appeared, I said to myself, "This is the man; he has much money and is a sacrifice worthy of Kali." Do thou, brother, make all necessary inquiries as to the movements of Suraj Mull.'

'Master,' said Mulraj, 'I know Suraj Mull well; his servants are my friends. He often visits the holy city of Jaunpur, and perhaps once a month or so goes to Bhandara. He has transactions with a banker in that town, with whom he deposits his money. As soon as I hear that he is about to travel I will tell thee, so that thou mayest inform the chief.'

III.

When an Indian servant requires a holiday to visit his native village, which he has not seen perhaps for years, or for change of air and water, he does not say so, but urges some other reason. He has just received a letter, or, in more civilised parts, a telegram, saying that his father is at the point of death, and his presence is urgently required. Sometimes it is that the Pundits have fixed the auspicious day for the marriage of his daughter, and he must be present at the ceremony.

Devi Ditta wanted leave. What excuse he gave, whether death or marriage, is not known, but his real object, as the sequel will show, had something to do with a funeral.

His leave being granted with less difficulty than he had anticipated, he started from Basoda. At first his route lay along the high-road to Dhuma. He met many other persons, like himself passing between the two large towns and intervening villages. Here a man and a woman trudged slowly, carrying their bedding and cooking-pots on their backs—the woman plodding behind her husband, bearing the heaviest load. Next a bullock-cart, with a bevy of gay young women, on their way to some religious fair. A water-wheel was working at the roadside. Devi Ditta stopped to have a drink of water and talk with the driver. The groaning of the water-wheel ceased, while the bullock enjoyed a few moments' welcome rest. At evening he came to a village, where he decided to pass the night.

He was up before sunrise next morning. Quitting the high-road, he followed a rough country track that led to the banks of the Narbada River, which he crossed at a ford. The country became wild and uncultivated, and except for a solitary goat-herd he met no one. The track now led through the foothills of the Mahadeo range. During the heat of the day he rested, and ate the food he had brought with him. As the sun's rays lengthened he arrived at a ruined Hindu temple, dedicated to the worship of Kali.

He gave the password and private sign to a man who was standing outside, and was permitted to enter. There were about a dozen men present, all strangers to him, except for his friend Mulraj. These people addressed one another by fictitious names, in a language which we should describe as thieves' slang. One man he judged by his dress to be a Mussulman. This astonished him. He had never met a Mohammedan at a meeting of Thugs, and, knowing their hatred of idols and idolaters, he could not understand how a follower of the Prophet could join in the worship of Kali. The person who appeared to be the chief was a man of short stature and slight figure. His face was stern and forbidding, and the expression of his eyes showed a strong and unyielding spirit. Some present appeared to be people in a comfortable way of life, while others were simple ryots.

The chief explained his plans. A certain one, disguised as a *jogi*, or Hindu religious mendicant, was to proceed to a spot on the road which traversed the foothills of the Mahadeo range. The site chosen was near a well, where travellers would probably rest. Devi Ditta and Mulraj—as they knew Suraj Mull—were to proceed to Jaunpur, a rich and flourishing town on the banks of the Narbada. This city contained a celebrated shrine, and was much frequented by pilgrims. They were to clothe themselves as respectable shopkeepers, travelling to Bhandara on business. Suraj Mull was going to Bhandara, and they were to follow him. The chief himself, in the guise of an inspector of police, accompanied by two constables, would appear to be travelling from Bhandara to Jaunpur. The pace of the parties was to be so arranged that they should arrive at the rendezvous at the same time.

Before separating, they had to propitiate their tutelary goddess. A kid was sacrificed, and a bowl of its blood placed in front of the idol, together with offerings of sugar and *ghi*. Prayers were offered to her that their enterprise might be successful. The *rumal*, or scarf, with which they strangled their victims, and the pickaxe with which the graves were dug, were consecrated with ceremonies dating from ancient times.

IV.

At early morning the view of Jaunpur is picturesque. The reflections in the river of the white-washed houses and of the temples are tinted rose and yellow by the rays of the rising sun. Groups of gaily dressed women stand on the steps of the bathing *ghaut*. Some are about to enter the water; others have bathed and completed the religious ceremonies of their sect. Here stands an ascetic, with long, matted yellow-reddish hair, his face and naked body smeared with wood-ashes. His left arm is stretched vertically above the shoulder; it has remained in this position for years, and is now rigid and withered. Close by a man is lying on a wooden planked bed, studded with long iron spikes. He also has long, matted, dirty hair; his body is gray with ashes and dirt. Other *jogis* there are, with heavy iron rings in their ears, and massive chains wound round their bodies. Itinerant vendors of refreshments have set up their stalls, and are doing a good business. A sweetmeat-seller calls out the varieties of confectionery he has for sale, while flapping a fan to drive away the plague of flies which settle around. A milk-seller is advertising the good quality of his curds, and a fruit and vegetable dealer draws attention to the freshness of his goods.

Devi Ditta and Mulraj passed slowly through the chattering crowd, and walked towards the town, the streets of which were full of women purchasing food for the day's consumption. They were not in a hurry, and their progress was slow. They gazed about, asked the price of flour and *ghi*, and talked with the shopkeepers regarding the prospect of rain and the condition of the crops. A man was approaching them whom Mulraj recognised as a servant of Suraj Mull. Mulraj saluted him, inquired after his health, and asked what he was doing in Jaunpur. The servant explained that his master, the *zamindar*, was travelling to Bhandara; that he had trouble with the cartmen, who for some inexplicable reason did not wish to go farther; and that he was stopping in Jaunpur until he could obtain fresh men. Mulraj suggested that he and his companion

might be of assistance in the search for carts and men. This offer pleased Suraj Mull's servant, so the three men wended their way to the quarter of the town where the cart-men were usually to be found.

V.

His difficulties over the question of transport having been settled, Suraj Mull made an early start the following morning. He met the usual number of country-people on the road, but nothing out of the way occurred, and late in the afternoon he drew near to a grove of trees, where he intended to pass the night. At the roadside was seated a Hindu ascetic, or *jogi*, who asked for alms. To refuse the request would have brought bad luck, as well as maledictions from the *jogi*. The *zamindar* gave him some money, and heard that no other travellers had halted at the camping-place. The servants and the baggage having arrived, preparations were made for the night. While he was finishing his evening meal his confidential servant informed him that an inspector of police had arrived, and wished to pay his respects. Suraj Mull was glad to hear this news. He thought that the presence of the police would be an additional safeguard against thieves and robbers.

'*Ram, ram, maharaj*,' said the inspector as he advanced, salaaming. 'I hope I find your Honour in good health.'

'Quite well, inspector-sahib. 'I hope that you are not fatigued with your journey?'

'The journey has not been a long one. I have come from Bhandara.'

'And what is the news from Bhandara? Is it true that Dakoits looted the banker Khrishan Lal?'

'Quite true, *maharaj*. The *sowcar* would not disclose the hiding-place of his money. The Dakoits placed him over a charcoal-fire, and it was not until his flesh was badly burned that he told them where to dig for the treasure. They also injured his wife by tearing the jewelled rings and ornaments from her ears and nose.'

'Well, inspector-sahib, now that you and your sepoys are here, I think we may be safe from evil-minded persons.'

After further conversation on various topics, Suraj Mull said that, as they all had to rise early the next morning, he thought it was time to go to rest.

The inspector called to one of the constables, 'Moti Sing, come here. The instructions I gave are to be carried out now.'

The constable moved quickly behind Suraj Mull, slipped a handkerchief round his throat, and drew it tight. There was no time for the *zamindar* to resist, and he fell dead without a sound.

Meanwhile Devi Ditta and Mulraj had been sitting over a fire gossiping with Suraj Mull's confidential servant. On hearing the police-inspector's order, Devi Ditta sprang upon the servant and strangled him in the same manner. Mulraj and the cart-men who had been engaged with his assistance disposed of the remaining attendants of the *zamindar*. Graves were hastily dug, and the dead bodies buried. The plunder was divided among the members of the gang, who then dispersed in different directions.

The grove was empty, except for the *jogi*, who still sat by the roadside wrapt in meditation.

VI.

'Well, Devi Ditta,' said Mr Saunders, 'I am glad you are back again. I hope you have settled your business satisfactorily.'

'Thanks to your Honour's kindness, matters have gone well with your servant.'

Devi Ditta had resumed his duties, and was to be found again waiting on the veranda for visitors.

Some ten days or so after his return, a young man, attended by two servants, rode up to the collector's house. One of the servants asked the *chaprassi* to announce Krishan Lal, son of Suraj Mull, the *zamindar* of Dhuma. Devi Ditta led him into the reception-room. Coming out again, he sat with the servants, and discussed the news of the day. From them he learned that Suraj Mull had not returned home, and as his absence was longer than usual, his son was becoming anxious about him. It was known that Suraj Mull had arrived at Jaunpur, but there were no traces of his further movements.

Days and weeks passed, and yet Suraj Mull had not returned home, and no news of him was received. This disappearance of a rich and important man caused much speculation and gossip in the bazaars. Many said that he had been robbed and killed, while others believed that he had been detained on business, and would eventually arrive home safe and sound.

There was also much talk concerning Devi Ditta among his neighbours. It was noticed that on Sundays and holidays he wore better and richer clothes than he used to do; he had bought some land, on which he intended to build a house; the *bunnias* said that his daily purchases of food had increased; while the women gossiped about the new and valuable jewellery his wife wore.

These stories reached the ears of the police, who began to take an inquisitive interest in Devi Ditta.

Krishan Lal had informed the police that his father had a considerable sum of money in gold and silver and several articles of jewellery with him when he departed from his home. Some of the ornaments he would be able to recognise.

That Devi Ditta should have been absent from Basoda at the same time as Suraj Mull disappeared was perhaps only a coincidence; still, connecting his absence with his newly acquired wealth, there were grounds for the police to make further investigations. A search being made in his house, a large sum of money in gold and silver, together with jewelled ornaments, was found. It was improbable that a man occupying the menial position of a *chaprassi* could be the lawful owner of such valuable nose and ear rings, necklaces, and bracelets. As Devi Ditta could not give any reasonable explanation as to his possession of these articles, the police took him into custody.

At the trial Krishan Lal and his mother identified a necklace which Suraj Mull always wore. The links were of a peculiar pattern, and there were private marks on the clasp which they recognised. There was a gold bangle, which had the same marks. Devi Ditta was convicted of being in possession of stolen property, and sentenced to a long term of imprisonment.

VII.

Fifteen years had passed. To Devi Ditta it seemed that his whole life had been spent in prison, and that a former existence, which he sometimes remembered, was but a dream. He was not punished for laziness, neglect of tasks, insubordination, and other faults, like so many other prisoners. He was as quiet and well-behaved in jail as he used to be when he was a Government servant. Owing to his good conduct, he no longer had to wear heavy iron shackles on ankles and wrists; his labour was lighter, and he obtained other ameliorations.

One day a party of Englishmen arrived, with permission to visit the prison. They saw the prisoners working in the garden, preparing the soil for the cultivation of vegetables; inspected the sacks, matting, and similar articles made by other prisoners; watched the manufacture of the coarse paper used by the inferior Government officials for accounts and correspondence; but they were chiefly interested in the carpet-factory, where carpets and rugs were made, equal to those of Kabul and Bokhara for beauty and strength.

One of the visitors had heard many blood-curdling stories of the Dakoits: how they surrounded villages, killed the inhabitants, burned the houses, and carried away as much plunder as they could. The mysteries of Thuggi, and the secret manner in which they were able to carry out their nefarious designs, fascinated him. He wanted to see a Thug, and learn how they strangled their victims.

He therefore asked the head-jailer if there were any Thugs in the prison. He was told that there was a man who, it was believed, had belonged to the fraternity. Devi Ditta was accordingly sent for, and shortly appeared. The head-jailer was told to inquire how the Thugs manipulated the *rumal* and threw the noose.

Devi Ditta was standing quietly, apparently uninterested in what was taking place; but on hearing the head-jailer's question his demeanour changed, and he became more alert. He hesitated a moment, and then said, '*Maharaj*, your servant knows nothing about Thugs, except what he has heard from other persons. It is true that a friend once explained how they killed people. Let me have a handkerchief, and I will show what he taught me.'

One of the Englishmen offered his pocket-handkerchief. But Devi Ditta shook his head, and said it was too small. 'Give me that one,' said he, pointing to a scarf which one of the warders was wearing round his waist.

Taking the scarf in his hands, he stood silent, his eyes cast to the ground, his lips moving, as if uttering unspoken words.

The warders were standing close by, watching the prisoner. The Englishmen drew nearer to obtain a clearer view of what he was doing.

Devi Ditta threw up his hands quickly. The horrified spectators saw the noose fall around the neck of the nearest visitor. . . . .

The warders seized the prisoner—but too late.

'*Devi Ji ki Jai!*' ('Victory to Devi!'), cried the Thug. He had once again sacrificed to Kali.

MORE ABOUT MELBA.

By Sir LANDON RONALD.

I.

ONE of Melba's most marked characteristics is her bluntness. She says what she means, and means what she says. I remember her plain-speaking causing a little scene at Paddington Station which tickled my sense of humour. It was at the time she had a house at Marlow. After singing at the opera, as indeed under almost any pretext, she would always have a special train. But on this particular Saturday afternoon she chose to travel by the ordinary train, accompanied by her maid, a foreign violinist of repute who was on a visit to this country, and to whom she wished to pay some attention (his name, for the moment, I forget), and myself. It was in the height of summer, and the train was packed.

Just as we were about to depart (having found seats in a carriage where soon afterwards at least five people were standing) a regular English exquisite, with an eyeglass in his eye and a drawl, sauntered up to our carriage, and, addressing Madame Melba, who was nearest the window, said in a very affected voice, 'Is there any room he-ah?' 'Can't you see,' was the prompt reply, 'we are more than full up?—unless you wish to sit on the floor.' The young man stared at her for a second, drawled, 'Oh, no! I should prefer to sit on your lap,' and moved away.

A minute's awful silence reigned, but immediately the train was well on the move our gallant foreign fiddler friend got up from his seat in great excitement, and shouted at the top of his voice out of the window, 'You plackguard! You scountrel! If you kom here, I gif you one ponch in ze nose.' The wrath of this chivalrous defender of the fair sex only subsided when the train was well away from the young man, left behind on the platform, roaring with laughter and shouting, 'Come on, Sausage; I'll knock you out first round.'

A few days afterwards I received an invitation to spend Sunday at Marlow, as Joachim was staying with the prima-donna. I must admit they made a funny couple together. The heavy, ponderous, learned Hungarian fiddler, used to being listened to with awe and bated breath; and the vivacious, chaffing, light-hearted prima-donna, throwing all seriousness to the wind and heartily disliking hero-worship in her own home. They were in very truth the two extremes meeting, and yet Joachim's fascination and admiration for Melba was very real and very sincere. So far as I remember, there was only one other person present, Mr Arthur Davis, a Stock Exchange magnate, a well-known 'first-nighter' and patron of concerts and opera.

After dinner some informal music began. Joachim played with me several of the Brahms-Joachim Hungarian dances, and played them wonderfully. Then Melba sang a Mozart aria, with violin obligato, and eventually Joachim and I played the Kreutzer sonata of Beethoven. Just as we were about to begin the last movement I discovered, to my dismay, that we had missed the last train back to town. Davis and I had to get back, so what was to be done? There was only one way—a special train. The local station-master placed every possible obstacle in the way, but eventually, on his being persuaded that the matter was of vital importance to the State, the special train was duly obtained. It was composed of one saloon-carriage and an engine, and when Davis was called upon to pay for it, I remember his remarking that it was the greatest and the cheapest concert he had ever been to in his life.

II.

For several years I conducted Sunday concerts at the Winter Gardens, Blackpool, in the summer, and Melba on many occasions came and opened the season for us by appearing at the first concert. It was on one of these annual visits that an incident occurred quite worth relating. The great diva had sung several encores, and could not make up her mind what to choose for another. Just as she was going on to bow her acknowledgments once again, she said to me, 'Come and play "A Little Winding Road" for me'—that being a song of mine which she sang a good deal at that time. Oddly enough, it was originally written for a contralto—Clara Butt, to be precise; but, owing to certain difficulties with publishers which it is unnecessary to go into here, it was never sung by her. It is a song (one of a cycle called 'Four Songs of the Hill') which has been a great selling success, and the artiste who first sang the complete cycle was that exquisite singer (who has now retired) Miss Muriel Foster. As it was very much in vogue at the time, I happened to have been playing it in the contralto key a great deal. It was fairly natural, therefore, that on the sudden demand of Melba to play it for her I should strike up the original key—two or three tones lower than the soprano key. The diva had not sung a bar before she also realised it, and, in the most natural manner imaginable, stopped, and said in her very carrying speaking voice, 'Landon, you are playing it in the wrong key.' I laughed, played a few chords of transposition, and began again. She caught my eye, and we both burst out laughing, with the result that the whole audience took it up, and that it was *the* success of the evening.

A year or two after I became Principal of the Guildhall School of Music I was most anxious to get so great a singer and so dear a friend to come and give the students the benefit of her advice and great experience. After very much persuasion, I got her to promise to read them a paper, 'On Singing,' written by herself. It is very curious that at that time she could neither read nor speak well in public. During and since the war I have heard her make admirable little speeches without fear or hesitation, but at the particular period to which I am referring her nerves, as a rule, completely prevented her doing herself justice. Realising all this, she asked permission to come to the school a day or two previously and rehearse her essay on singing in the theatre where she would have to read it. This impressed me very much, because it showed how serious she was about everything she undertook. I duly sat in front with one other friend of hers, and she went on the stage and began reading. Continually she stopped and assured me she could never do it, and continually I assured her that she was doing

splendidly. She went away very 'fussed' and unhappy, but promised that she would not disappoint me by keeping away altogether, as I rather feared.

We had made great preparations to give her a royal reception. The chairman and committee, all dressed in their mazarine gowns, were there to receive her; hundreds of girls had donned their white dresses with red sashes; and an address of welcome and a small souvenir of the occasion were to be presented to her by the chairman. Her entry into the theatre was the sign for an enormous outburst of cheering such as even Melba could seldom have experienced. The chairman having duly performed his part, it was my turn to say a few words about the great artist whom we were entertaining. This done, she got up, manuscript in hand, to commence. But the cheering and applause was deafening, and at least two minutes must have elapsed before she was allowed to begin. She was cruelly nervous, and this overwhelming reception unnerved her the more. I was sitting next her on the platform, and felt, after her few opening phrases, that she would never get through. I was but too right. Another heroic attempt to master her nerves failed, and, with a pathetic smile and a gesture of regret, she turned to the audience and said, 'I'm awfully sorry, but I cannot go on.'

The students did not know whether to applaud or to keep silent. But I at once got on my feet, took the manuscript from Melba's hands, and announced that I had arranged with her to read it on her behalf. It was a difficult thing for me to do, because I had never read it, and had heard only part of it at the private rehearsal to which I have alluded. I believe I got through all right, but it was a job I should not care to have to repeat. It is the only time, during the many long years of our friendship, that I have known Melba break down before a public, and I believe it was a unique experience on her part.

III.

The great singer has not had many 'narrow escapes' during her travels, but one that occurred at Chicago when I was with her is worth relating. She was announced to give a concert, and the newspapers, in true American fashion, had written columns about 'the great musical treat in store,' but dwelt more on the fact that 'the great singer has with her all her most priceless jewels, and will wear them the night of the concert.' Melba had been in the habit of occupying the same suite of rooms in the Auditorium Hotel (they were called 'The Melba Suite'), and it caused her great annoyance when she was informed that on this particular occasion they were already occupied by a lady and her husband. As after-events proved, this was fortunate for the prima-donna.

On the day of the concert two well-dressed men entered the hotel, walked upstairs to the 'Melba Suite,' and ringing the bell, were admitted by the lady in question. Promptly closing the door behind them, one of the ruffians, producing a pistol, said, 'If you scream, I'll shoot! Show me where you keep your jewels.' The poor lady had the presence of mind to answer, 'My husband's inside, and if you don't leave, I'll call him.' This happened to be untrue, but in any case it made no impression on the men, as they believed they were speaking to Melba, who, they knew, was not married. Accordingly, they proceeded with their work, one keeping the pistol pointed at his victim's head, whilst the other ransacked the rooms. Finding nothing of any particular value, and afraid to prolong their stay, they cleared out a wardrobe, taking several coats and trousers, and escaped. The unfortunate lady completely collapsed.

When the story leaked out, Melba was most sympathetic and kind, and did everything she could to help. Since that fortunate escape she has ceased to travel with many jewels—at all events any of great value.

MAN'S WORK.

CHAPTER XIII.—*continued.*

IV.

WITH the arrival of that anonymous box of cigars, brought to camp by Denison two nights afterwards, a touch of solace settled on three weary men. They smoked wordlessly, breaking the unwritten law, and blessing the unknown giver—though Shanklin made a shrewd guess at his identity. It was the sort of thing he would like to have done himself. There was, too, another factor he found comforting. It seemed as though from strange and unexpected sources they were drawing aid in the time of need. Three women—each stimulated by a different motive—had come to the rescue. He mused over this till it gradually became clear that hidden forces were aiding: not those powers by which man most often wins success, but secret elements that moved mysteriously and brought with them a fine, high strength of amazing quality. Intuition, gratitude, love, and filial contrition had all ranged themselves in support.

His mind moved on to what would follow if he did win out. There would be freedom, reputation, and independence. The world would lie before him, opening inviting arms to his youth,

and health, and riches. He could gratify every longing — except one. At that thought the vision faded. He saw Sitwell sinking lower and ever lower. He saw Claudia—but at this he shut the eyes of his soul, and tried not to see anything more.

Harrison, emerging from the cook-tent, thrust his hands into his pockets and stood looking at the dipping cable. He stooped, scooped up a handful of sludge, rubbed it between his fingers, and snuffed it, his eyes half-closed. Then he grunted contentedly. He was like the rest of them, walking in his sleep; but sleep, of late, was out of the question. 'I smell oil, Jack. That is, I don't actually smell it, but the something one smells first.'

'What you smell is hope. I've noticed it for months. It's the effect of a good cigar.'

Harrison shook his head. 'It's what I've taken twenty-five years to learn. Suppose we do strike it, what then?'

'Pay up, sit tight, and watch our money come back; then cut this fifty acres up into small leases and sell out.'

'It's likely we'll want twenty thousand at the end of the month. Where's it coming from?'

Shanklin grinned. 'On the least show of oil, we can get all the money we want.'

'Maybe. I reckon we can. But I'd like to see that fixed. Whom are you going to?' The older man spoke as though fortune were assured.

'I hadn't got that far,' said Shanklin slowly, and relapsed into thought. It had been too difficult to visualise himself as a successful man, no matter what determination might animate his efforts. It was the sort of thing one read about as happening to others. 'There's Burley,' he murmured, half-aloud. 'I used to work for him. He's the most likely. I've an idea he likes me.'

Harrison regarded him shrewdly. 'Then for God's sake wash, shave, get into decent clothes, and go and see him. On your looks now, I wouldn't lend you thirty cents myself.'

Shanklin smiled a little. 'He fired me six months ago.'

The other man stared. 'Then why go to him now?'

'Because I think he's sorry he fired me.'

'Then hustle, or he may get over it.'

V.

Shanklin hustled, then waited two hours for a lift into the city. He went straight to Burley's office, and was recognised at once by the elderly stenographer, who had missed his youth and buoyancy more than she cared to confess. She greeted him with undisguised pleasure. 'You've changed, Mr Shanklin. You look older and—well—bigger, and even stronger than you used to.' She examined him with frank interest. 'There's something about you that's different.'

He chatted for a moment; then she tapped at the senior partner's door and put her head in. There issued Burley's big voice. It held a note of surprise, but he would see Mr Shanklin at once. The latter found him as bustling and masterful as ever, but with a certain genuine pleasure on his bulldog face.

'Come for that advice, &c., young man? Well, what is it? Don't mind saying I've missed you every day. Got a sort of plaster-face idiot at your desk who doesn't know his own mind. Ever think of taking up legal work again?'

'No, Mr Burley.'

'H'm—pity. Think you should do well in spite of your darned altruism. That's what got me, confound you! Hear that Mr Brooks died some months ago?'

'Yes, I heard it.'

'You married, didn't you?'

'No, sir.'

'Oh!' Burley was linking up the death of Courtney Brooks and this young man's dismissal. It made him a little uncomfortable. 'What have you been doing?'

'Practical work — drilling wells. Can you give me ten minutes, sir?'

The last words sounded like old times, and Burley smiled at that. He confessed to wanting his senior clerk back again. There was even room for a junior partner now. 'Yes, as long as you like, but first let me get a word in. That last talk we had was—well—a little hot. I've thought of it since, and I'm inclined to believe now that you were right—only you were so damned lofty about it. It may interest you to know that I'm not doing any work for—well—your particular friend. I've good reasons, too. Now, as to yourself, if you're just a little tired of drilling wells, come straight back here, and we can fix up that partnership business right away. That's all.'

Burley finished with a snort. He had done the decent thing, and was rather red in the face.

Shanklin stared out of the window at the Sierra Madre. For a minute he could not quite trust himself to answer, and scanned the distant crests, now tender in the rays of the declining sun. When he did speak, it was with an unmistakable jerkiness. 'Thank you for that, sir. It means a lot. May I decide on the 2nd of September?'

'Why not now?' Burley was vividly mindful that when Shanklin commenced a job he finished it, once and for all. At present it seemed that nothing in the office was ever definitely finished.

Shanklin told him, beginning at the beginning. The little man sat quite still as the tale unfolded, and only a little twitching of the bulldog features revealed his changing mood. It was a plain tale and dispassionate, but every word a stinging truth. Sitwell's name was not mentioned, but there was no chance of misap-

prehension. The losing of the bit, the emery-sand in the oil, the fire—all these were detailed in words that lost nothing through their direct simplicity. Shanklin might have been relating the tribulations of a friend.

The little man listened spell-bound, realising that this was a chapter of life, intimate in its drama, heroic in its setting and presentation. It was the real thing. The walls of his office melted away, and he saw himself again young, battling for success with all the fierce joy of manhood in his veins. Could a man who had tasted this spend his life at a desk, fingering briefs?

'So the way the thing stands is that I may want twenty thousand dollars on the 1st of September. If I do, it will be because I have made my fortune. If I don't make it, we drop the lease, which automatically passes into other hands—and I get a job. Will you finance me to that extent? I'll give you my note for the amount, and my interest in the property as security. If the well doesn't come in, you can destroy the cheque. If it does, you're safe.'

Burley grunted vigorously. 'Of course you can have it. Why the devil didn't you let me know before how things were going?'

'I didn't feel it was the sort of proposition I could fairly put up to any one. Harrison and I were satisfied, and we pyramided on it—but that's another thing. As for those three women—they didn't, as it were, come in at all. They were sent.'

Burley pulled down his brows. 'Just what do you mean?'

'I only half-know myself. It was something more than chance. I guess it was destiny.'

'Perhaps.' The little man nodded. 'Perhaps it was. Do you call this destiny?' He handed Shanklin a cheque. 'You'd never guess what I call it.'

'What?'

'Bread upon the waters returning! I owe you something. This doesn't exactly pay it—but it will serve to show you how I feel. Stay and have dinner with me. I'm all alone.'

Shanklin fingered the cheque as in a dream, then made his thanks with stumbling sincerity. 'May we leave it that I'll dine with you in any case on the 2nd of September?'

Burley nodded. 'Meaning that either you'll be a rich man or——?'

'Or perhaps your junior partner.'

(*Continued on page 365.*)

THE MONTH: SCIENCE AND ARTS.

THE 'CONTAINER' SYSTEM OF TRANSPORT.

THE advantages of what is known as the 'container' system for the transport of goods seem so obvious, once they are perceived, that it is difficult to understand why this method was not adopted years ago. As in many other directions, however, the war has rendered a new system possible by causing the almost universal adoption of the motor-lorry—a necessary concomitant of transport by means of containers. Those of us who have crossed the Channel to France will have seen containers in use for passengers' luggage, the various items being packed into huge crates, which are lifted off the railway trucks into the steamers, and back again at the port of landing, thus saving an enormous amount of handling. For ordinary goods, containers are loaded at the manufacturers' or merchants' warehouses, conveyed to goods-stations on motor-lorries, and lifted into railway trucks, the process being reversed when delivery is made to the customer at the end of the journey. The saving in labour by this plan is too evident to need any explanation here, the only requirement being that the containers shall be uniform in size, and limited as regards weight, so that railway wagons and road vehicles can be made to suit. On our railways the nearest approach to the container system, apart from the example quoted above, is offered by the pantechnicon, which can be loaded with furniture at a house, locked up, and delivered at another house intact, sometimes after a journey by both rail and sea. Furniture-vans, however, are too big and unwieldy for the transport of ordinary goods; in fact, it is not unlikely that they themselves will be superseded, even for the special purpose for which they are at present used, by containers on lorries. One great advantage of containers is that they prevent pilfering *en route*, as not only are they locked, but the trucks in which they are carried are so constructed and partitioned off into sections that the doors cannot be opened until the containers are lifted out. Furnished with a lifting eye at each upper corner, containers are made weather-proof, and, being handled by cranes, they are not subjected to the severe usage meted out to the ordinary packing-case. Hence the goods inside need not be so carefully and expensively packed as for despatch by existing methods. A type of container being adopted on the railways in the United States measures, roughly, 9 feet by 7 feet, with a height of 8 feet. It weighs approximately 3000 lb. when empty, and will carry 7000 lb. Railway trucks for these containers will take eight each, and they can be transported on the road by 5-ton lorries. There is little doubt that the container system will eventually be adopted in this country.

THE LIGHTING OF MOTOR-CYCLES FROM THE MAGNETO.

Even among the owners of cars and motor-cycles, there are few who understand the working of a magneto well enough to know that current for lighting can be obtained therefrom. Yet such is the case, and apparatus for this purpose has been in use for several years. A complete explanation of how a magneto produces the sparking current for a car motor would occupy too much space to be given here, but it may be stated that the revolving armature has wound upon it an inner coil of stout, insulated copper wire, and an outer coil of very fine, silk-covered wire. When the armature is revolved between the poles of a magnet a flow of electricity is produced in the inner coil. This current is broken by the contact-breaker when a spark is required, and the effect of breaking it is to induce a current in the outer coil of fine wire, which is in circuit with the sparking-plugs. The current in the inner coil is not uniform in either strength or direction, but begins from nothing and gradually increases to a maximum in one direction, then dies down and begins to flow in the opposite direction, increasing to a maximum, and then gradually ceasing. This cycle occurs twice in each revolution, and the current is broken at its maximum flow, as the bigger the current broken the stronger is the sparking current in the fine wire. It would be quite possible to collect the current from the inner coil and pass it through low-voltage lamps; but owing to the variation from nothing to a maximum twice in each revolution, and the momentary breaking of the flow, the lights would flicker badly. The current is, therefore, passed into a storage-battery, whence it can be drawn in a steady flow for use in the lamps. When a battery is being charged, it is necessary that the pressure, or what is called the voltage, of the current should exceed that of the battery. If the pressure is too low the current will flow backwards, and the battery will be discharged instead of being charged. Again, current must be fed into the battery one way only. These exacting requirements are met by means of a tiny lever which is fixed to a disc attached to the contact-breaker and revolving with it. One end of this lever is pivoted, and is connected to one end of the inner coil. The other end carries a carbon brush. When the magneto is stationary a spiral spring holds the brush end of the lever in a central position, but when the speed increases beyond 600 or 700 revolutions a minute the lever flies out, owing to centrifugal force, until the brush makes contact with a metal segment in the cover. From this segment the current passes through a wire to the battery, and back to the other end of the coil through the frame and spindle of the magneto. At the speed specified the pressure of the current is enough to overcome the voltage of the battery, and the battery is charged. The segment, of course, catches the current in one direction only; the charging, therefore, is done by an impulse current once in every revolution, but this is enough to maintain the lights. Designed principally for motor-cycles, an outfit recently devised comprises a special attachment to the circuit-breaker as described, with a new cover, a battery, and a switch, and head, side, and rear lights.

A NEW TYPE OF ELECTRIC MOTOR.

Some of the best brains in the world have been and are still engaged with the problem of the invention of new electrical apparatus and the improvement of old, yet it has remained for a comparatively obscure worker to originate a new type of electric motor for small powers. The principle upon which the new motor works may be grasped by attaching a cord to one prong of a tuning-fork, the loose end being lightly stretched in a direction away from the other prong. If a cotton-reel, mounted on a knitting-needle so that it can turn very easily, be pressed against the cord while the tuning-fork is vibrating, the reel will rotate, and that always in the same direction. Exactly what form of motion is given to the cord by the vibrating fork has not been explained, but the important fact is that it tends to produce motion in a specific direction in any body in contact with it. This fact is taken advantage of in the new electric motor, in which the vibrating part of the mechanism is worked by an electro-magnet. If an electric current be passed round a coil of insulated copper wire wound upon an iron core, the core becomes an electro-magnet while the current is passing, and will attract other pieces of iron. If the current be alternating, it will pass in pulsations, first in one direction and then in the other, rising in each case from nothing to a maximum, and then dying down again, and making the core a magnet at each pulsation. This happens at the rate of fifty to a hundred times a second. When the core of such a coil is placed close to one prong of a tuning-fork it will attract it in a series of impulses, and if the impulses per second synchronise with the natural vibrations of the fork, the fork will vibrate continuously so long as the current is passing. As a matter of fact, a tuning-fork need not be used, any kind of spring plate being equally good. Instead of a cord being used, a tape is attached to the spring plate and passed partly round the driving-pulley of the motor, the other end being stretched by a spiral spring. Curiously enough, the tape does not wear, showing that no slipping takes place. The chief claims made for these motors are: (1) their cheapness and simplicity, with an absence of bearings and the consequent necessity for lubrication; (2) the unusually large initial power, allowing a full

load to be taken up the moment the current is switched on; (3) the low speeds attainable (as low as 4 or 5 revolutions per minute, if required) without the use of intermediate gearing; (4) while the efficiency is low, the power developed by these motors per unit of weight is very much higher than the normal. It may be added that at present only motors of fractional horse-power are being manufactured.

A SIMPLE LOAD-INDICATOR FOR LORRIES.

Although the overloading of motor lorries and vans does not often involve danger to life and limb, as is the case with ships, the practice imposes a strain upon the springs and the driving mechanism for which they were not designed, and every owner of such a vehicle endeavours to limit the load to the makers' rating. For goods in bags, bales, or packing-cases, the load is easily calculated; but for materials in bulk, such as sand, gravel, or road metal, the weight (owing to varying conditions) is often a matter of guesswork. To overcome this difficulty a very simple load-indicator has been brought out, which measures the weight by the depression of the springs. Leaving out for the moment certain features for rendering the device suitable for different vehicles and loads, we may say that it consists essentially of a light steel bar, with a pointer mounted at one end, while the other is bent round at a right angle to form a lever. This bar is mounted in two brackets under the floor of the vehicle, parallel with the axle, but a little to one side, so that the bent end comes over the middle of the axle. The pointer end of the bar passes through a hole in the middle of an indicating dial, which is fixed at the side of the body. At the middle of the axle is clamped a steel upright bar with a fork at the top, in which lies the end of the bent lever, the bent portion being practically horizontal at half-load. When the body is loaded and falls, depressing the springs, the indicating bar falls with it, but the end of the bent lever being held up by the axle-fitting, the bar and the pointer are turned to an extent dependent upon the weight of the load. It is a simple matter to mark the dial 'light' when the vehicle is empty, and 'loaded' when the load has reached the rated limit. Motor lorries and vans vary in width, height of axles with reference to the body, and other features, and these differences have to be allowed for in an instrument of this character. To meet these requirements the upright bar on the axle is made in two pieces to give vertical adjustment, while the clamp will take any size of axle. The indicator bar is telescopic, the inner end being a solid bar, which slides into an outer end consisting of gas-piping, and is locked into the piping by a screw. Flat bar steel, $\frac{1}{8}$-inch in thickness, is used for the brackets, which are fixed with wood screws to the floor of the body. A coil spring is fitted to the bar at the inner bracket to keep the lever pressed down in the fork. The pointer is fitted with a screw passing through it, the function of which is to lock the indicator out of engagement with the axle when the vehicle is running. In the most recent form of the indicator the movements of the pointer are multiplied in the proportion of four to one of the bar. It is claimed by the inventor that the indicator will show the load within one hundredweight.

A CHEAP PORTABLE GAS HEATER AND COOKER.

In addition to the various forms of gas heating and cooking appliances which are designed to be more or less permanently fixed, there is a distinct demand for a portable type of heater upon which simple cooking operations can be carried on. Among the appliances devised to meet this requirement is a heater and cooker which can be readily moved from room to room, and placed in any convenient position, assuming that a long enough rubber tube is used to connect the burner to the gas-supply. The appliance is so simply constructed that it can be sold at a very low price. The lower portion consists of a rectangular box, open at the sides, and having a slightly raised floor. This box is surmounted by an upper storey in the form of a pyramid with the top cut off. Inside the pyramid are asbestos fireballs, while running across the apparatus, just below the bottom of the pyramid, is the horizontal pipe of a Bunsen gas-burner. At the sides and ends of the pyramid are holes through which some of the heat escapes into the room by radiation. The complete contrivance measures 9 inches by 6 inches at the base, and is 9 inches high. When the burner is alight, the fireballs become red-hot, and give out enough heat to warm a room of 3000 cubic feet capacity, with a gas consumption of 15 feet an hour. Grilling or toasting can be carried on under the burner, the heat from the fireballs striking downwards; the top of the pyramid is available for a kettle or a saucepan; while the ends are arranged to hold two flat-irons. This heater and cooker is strongly made in sheet-steel, and includes a pan for grilling.

AN INGENIOUS WOOL-WINDER.

One method by which woman has been accustomed to demonstrate her power temporarily to enslave the 'mere man' bids fair to become obsolete, owing to the invention of a simple but effective device for holding a skein of wool when it is being wound into a ball. The device comprises, in the first place, two flat arms, about 13 inches long and 1 inch broad. Each arm is formed of a strip of tin-plate bent round at the edges so as to form long, narrow tubes. Into these tubes slide the two straight portions of a stout steel wire, roughly like a very long hair-pin in shape, but bent at the top into a U-shaped fork. One of these forks, therefore, projects from each end of both arms.

The two arms are fastened together at the centre by a small copper tube, which passes through each flange of the tin strips, the arms being mounted edgewise on the tube. Fixed in one arm, the tube is loose in the other, which can, therefore, be turned at right angles to the fixed arm, the two thus forming a cross, and allowing of the skein of wool being placed round the four forks. When not in use, the two arms fold up, so that they lie parallel side by side in one flat strip. The cross turns on a wire spindle which passes through the copper tube, this spindle being part of a very ingenious wire clip which can be pushed over the edge of a table or the back of a chair. Powerful springs cause the clip to hold on to whatever piece of furniture may be found convenient, and thus make the device a 'temporary fixture.' The forks, of course, may be drawn out or pushed in so as to fit the size of the particular skein being wound. The person winding should sit facing one end of the device, so that the arms of the cross revolve towards her.

A DIRECTION-INDICATOR AND A STOP-SIGNAL FOR MOTOR-CARS.

A Norwegian printer has recently invented an ingenious 'direction-indicator' for the use of motorists. The device consists of a cylinder which may readily be attached to the top or bottom of the wind-screen by means of two claws. The length of the cylinder is exactly the same as the breadth of the wind-screen. Inside the cylinder is a rod fitted with an electric-lamp at each end. When the driver of a motor-car is within twenty or thirty yards of a spot where he wishes to turn either to the right or to the left, he pushes, with a very easy motion, the rod in the corresponding direction, thus exposing the light and indicating the direction in which he intends to proceed. At the same time an electric-bell is automatically set in operation, and is kept ringing until the driver has rounded the corner and pushed the rod back into its normal position. The lamps may be made so as to show green to the right and red to the left, in accordance with the rules in use at sea; or any other variation may be adopted which is in accordance with police regulations. The inventor claims that there is in existence no other apparatus in which a single movement sets in motion both a light-signal and a sound-warning. The invention will undoubtedly be of great benefit to motorists driving in the dark, as it will diminish the risks run by themselves and by other traffic. It will entirely do away with the lifting of the hand by the driver, which is of little use in badly lighted streets, and which cannot readily be done from an enclosed car. The same inventor has also devised a stop-signal to be placed behind the car. It consists of a rectangular lantern, the light of which can be switched on in an instant, showing the word 'Stop' in white letters, and thus indicating there is danger ahead. An application for a patent for both inventions has been lodged in this country, and it is expected that in due time the devices will be on sale in Great Britain.

A NEW PISTON-RING TOOL.

Owing to the high charges made at garages, many car-owners now undertake for themselves minor repairs to their motors. Of these the operation of renewing a faulty piston-ring is often fraught with some difficulty, and even the good rings have to be taken out occasionally to clean the grooves. It is no easy matter to get out a piston-ring without breaking it. A recent device for overcoming this difficulty consists of a curved and grooved steel tool. Two projections are slid along inside the groove by means of a pair of external rings in which thumb and finger are inserted, as in a pair of scissors. When the rings are pulled apart, the two projections come together, and in this position they can readily be inserted in the joint of a piston-ring. The two rings are then pulled towards each other, which has the effect of opening the piston-ring, when it will come off the piston without further trouble.

A PUNCTURE-SEALING INNER TUBE.

In our issue for December last we described an inner tube for motor-cars and motor-cycles which defies punctures, for as fast as the punctures are made they are made good. Since then we have become acquainted with another device which achieves the same end in a different way. In this tube the 'tread' half contains a layer of mastic, inserted between an outside and an inside layer of ordinary rubber, with the result that when the tube is pierced, and the piercing agent is withdrawn, a small bead of mastic instantly forms and fills up the hole, rendering the tube as air-tight as before. The much longer life of these self-sealing tubes, as compared with the ordinary varieties, and the lessened wear of the outer covers due to the inner tubes being always fully expanded, make for both comfort and economy.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (*a*) a reply post-card, or (*b*) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'
2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.
4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

SAMSON AND THE DELILAHS.

AN ELEPHANT TALE.

By Lieut.-Colonel GORDON CASSERLY, Author of *The Elephant God, Life in an Indian Outpost, Jungle and River Warfare, The Red Marshal,* &c.

PART I.

I.

THE little brown monkeys in the tree-tops were in a paroxysm of fury. They chattered, bared and gnashed their teeth, and in impotent anger grasped and shook the branches on which they sat. Then, finding that the demonstration had no effect, they fell to quarrelling among themselves, as is their wont, and bit and scratched each other savagely, breaking off their fights now and then to look down again and shriek out more abuse.

But the big elephant on the ground below was indifferent to their insults and anger. He was too used to the wordy clatter of the *bunderlogue** to notice it, and, with skull pressed against the tree-trunk, he continued to push steadily with all his weight, until the roots gave and the tree came crashing down, rending the rope-like creepers that bound it to its neighbours and agitating them wildly in its fall. Then the destroyer moved forward to its crown, and sweeping huge bunches of leaves from its upper branches with his trunk, crammed them into his mouth. His calm indifference infuriated the monkeys beyond measure. It hurt their vanity; for the great grievance in life of their tribe is that the animals of the world on the ground below ignore their existence. Except, indeed, the tiger and the panther—and their attentions the unhappy *bunder* would gladly dispense with. For these great striped and spotted cats are far too fond of breakfasting on any unwary monkey that they succeed in surprising on the ground or in fetching off a low bough by an unexpected spring.

Against elephants monkeys have a different cause for complaint. These big beasts have a selfish habit of destroying the trees in which the dwellers above the earth find homes and their food-supply. A herd will in a few hours lay low a large patch of trees, which, among other results, closes the air-road in the upper branches and forces the monkeys to descend and travel on the ground, a thing they naturally dislike doing—for there they are apt to have undesirable meetings with those unpleasant beasts of prey that have a penchant for monkey-flesh. So it was not to be wondered at that this particular band voiced their grievance against this particular elephant loudly. And, still abusing him, they leaped off by airy paths to other and undisturbed parts of the jungle, swinging across the voids between the trees, gripping the meeting boughs with ready hand, the babies clutching their mothers fast, and proving no hindrance to their flight. Indifferent to their departure as to their presence, the elephant continued his meal, in the course of which he did further damage to the forest.

But the jungle possesses a marvellous power of recuperation, and recovers from worse ravages. In the hot weather, when the leaves fall from most Indian trees at the very season when in northern climes they are greenest and freshest, come the forest fires. Through the parched jungle they sweep, devouring the tinder-dry grass and undergrowth, shooting up the trunks of the trees and along the great boughs, seizing on the glossy green orchid-plants that blaze as fiercely as though steeped in oil. The roar of the rushing flames is terrifying, rising through a gamut of appalling sound when the breeze freshens, sinking in diminished volume as the wind dies away. Deafening noises mimic the crackle of musketry as the hollow stems of burning bamboos explode with sharp reports, now swelling into the rattle of thousands of rifles as the fire seizes on a large clump, now falling to a few dropping shots when only a single plant burns. A fiery column blazes fiercely to the leafy canopy overhead, as the flames rush up through the hollow trunk of a decaying tree, or devour the dry wood of another long dead, but held up by a network of creepers. With every puff of wind clouds of sparks fly forward; where they drop little fires begin to flicker, and swell into tongues of flame that lick up the vegetation around. And the red ruin roars on, and leaves utter desolation behind. The forest is swept clear between the scorched

* Monkey-folk.

 [*All Rights Reserved.*]

trunks of the monster trees; the earth is blackened and covered deep in ashes; the tall undergrowth, the interlaced creepers, the breast-high grass, and the matted bushes have all vanished in flame. And the eye can now see far between the tree-trunks, where formerly five or ten yards was the limit of vision. The forest seems blasted, dead.

But presently the black clouds will gather before the swift breath of the monsoon, the sun be blotted out, and the heavens rent by the flaming swords of the tropic lightning, as the world shakes at the awful crashing of the thunder. Then the rain will come—not as the dweller in temperate zones sees it, but in ropes, in sheets. Six, seven, eight inches a day; and that for weeks without intermission. And the forest awakes to a new incarnation. The blackened earth is washed clean, the parched and thirsty soil drinks its fill, and the jungle is born again. The grass, the tangled undergrowth, spring up incredibly fast at the welcome, revivifying caress of the water, and rise in taller, denser growth than before. And the forest animals, which fled before the fires and starved, come back to roam the forest again and feast on the new and luscious vegetation.

II.

The elephant had seen many such visitations during the thirty years of his life. He had come into the world in the troubled days of the Sepoy Mutiny, when Britain's grip on India seemed loosed. And now, from the Himalayas to Cape Comorin, from Aden to Mandalay, the varied peoples of the Indian Empire were celebrating the jubilee of their white-haired Empress, Victoria, Kaisar-i-Hind. When he was born the great Terai jungle in which he lived was not under her sceptre; but eight years later her soldiers made it hers in the Bhutan war. In his early days the myriad elephant-paths were seldom pressed by the feet of men. Now the farthest recesses of the jungle were known to the white hunter. And already the axe was sacrificing the forest giants to the needs of the tea-planter.

Heedless of history and the encroachment of man, the elephant browsed contentedly on the leaves of the tree that he had brought down. He was a splendid specimen of his race, nearly nine feet ten inches in height, worthy to carry the silver *howdah* of a viceroy. Although he would not arrive at his maximum strength for another five years, he was now fully grown and immensely powerful, truly a Samson among animals. He was all that an elephant should be. The best points of the thoroughbred were his: short, muscular legs, a straight back sloping to the long tail, a massive head set on a short, thick neck. His tusks were magnificent—long, shapely, curved, and spreading gracefully outward.

He was alone; for he had strayed, as was frequently his wont, from the herd to which he belonged. He had always been a wanderer. In his early youth this propensity had sorely perplexed his mother, and once in his young days had nearly made him fall a victim to a prowling tiger. Unlike his kind—as a rule elephants are sufficient unto themselves—he took a lively interest in the other denizens of the jungle. This curiosity led to trouble when, as a calf, he came upon what seemed to him a misshapen elephant with malformed trunk permanently upraised. When he tried to approach it, the stranger beast, which was a surly, ill-tempered rhinoceros, resented his familiarity with sharp teeth. The young elephant learned to distinguish between the only other forest-dwellers that approach him in size—the bison and the buffalo. He knew the *sambhur*—the big, black *nur*, or stag, with his thick, four-pointed horns and short, sharp brow-antlers, and the *maddi*, the hind, with her bright brown coat, slim legs, and ever-apprehensive ears. He could distinguish between them and the graceful, sprightly *muntjac*—the barking-deer, so named from its sharp call, that resembles a dog's bark—the buck with incurving horns, five or six inches long, growing from hair-covered bony pedicles three inches in length, and the curious sharp tushes projecting down and backwards from its upper jaw. Both it and the doe were quaintly marked with black lines springing from the nose and running up over the eyes, like elongated eyebrows raised in astonishment. The elephant babe used to watch inquisitively the huge, solitude-loving Himalayan bear as it shambled through the jungle, rooted in the ground like a pig, or climbed trees in search of food. He shrank back instinctively from the rippling, sinuous curves of that dreaded snake, the *hamadryad*, fifteen or sixteen feet long, as it glided swiftly through the undergrowth in search of prey. After his narrow escape from a marauding tiger in the days of his calfhood, he was careful to give the striped beasts a wide berth, until he grew too big to fear them, and they slunk aside when they encountered him in the jungle.

Only of the world that existed above ground-level was he ignorant. Animals do not look up; and so this great babe knew nothing of the life of the tree-tops. Of course, he had sometimes seen the bald-headed vultures when they jostled and pecked and quarrelled with each other over a carcass. And often the jungle-fowl whirred up suddenly from his feet and disappeared into the branches above his head—the sober, brown bantam hens, and the trim little cocks with their red combs, sharp spurs, and long, curving, green tail-feathers. Night and morning the silence of the forest was disturbed by their abbreviated crow—these progenitors of our common barnyard fowl have

but four notes in their 'Cock-a-doodle,' as compared with the five of the 'Cock-a-doodle-doo' of their civilised descendants in our farmyards. He sometimes saw those noisy tree-dwellers, the monkeys, on the ground, squatting on their hunkers or loping along on all fours, babies clinging tightly to their mothers' bodies, all ready at the least alarm to spring up into the nearest trees and disappear above the level of his eyes. But once they reached the upper branches he knew nothing of their life, though sometimes, in their rage at his indifference, they threw missiles at him. He had never seen the pretty, black-and-white-coated Giant Squirrel, or its aviator cousin, the Flying Squirrel, which springs boldly into the air and planes across the void between tree and tree, upheld by the wing-like membranes stretching from its upper to its lower limbs. Of the scanty bird-life of the forest, of the chattering green parrots, the gay-plumaged hornbills passing overhead with loud and measured beat of pinions, he also knew nothing.

Of men, too, and their habits he was ignorant. For the jungle tribes hold all wild elephants in dread, and keep out of their way, because of the cruel deeds of the few 'rogues' among them. And in Government jungles the stern laws of the Indian Forest Department protect the well-behaved of his race from the rifle of the sportsman. Only these evil 'rogues' are condemned to slaughter and allowed to be fair game for the hunter.

In the thirty years of his life Samson had roamed through much of the great woodland in which his lot was cast, the wonderful Terai jungle, that lies at the foot of the Himalayan Mountains and stretches into the plains of Bengal and Assam. Always a rover, he had quitted the herd into which he was born, and had won admission into another on sufferance, being then too youthful to excite the jealousy of the bulls in it. After some years he had abandoned it for a third, into which he had had to fight his way. Here, young as he was, his strength and courage had gained him the leadership of one of the groups into which an elephant herd is divided. This group he often deserted for days, weeks, at a stretch; though, when he returned, woe betide the tusker, young or old, that had dared usurp his place during his absence!

III.

He was now on one of his solitary expeditions, prompted by the wander-desire that had always possessed him. No dislike to the society of his kind moved him, for he was of a companionable temperament—only the spirit that ever urged him on to new ventures, new haunts. He had been alone for some days. It was early in the hot weather of the year. The cool north wind, that swept down from the mountains and agitated the tree-tops wildly, did not penetrate through the canopy of foliage—the leaves had not yet begun to fall. But now and then a faint air stirred the undergrowth. Suddenly the elephant raised his head and stretched out his trunk in the direction from which the breeze blew; for it bore a message to his sensitive nostrils. Elephants can scent their kind two or three miles away when the wind is favourable, and the breeze carried to him the unmistakable odour of others of his race, unknown to him, and not members of his herd. Curiosity overpowering him, he left his meal and moved slowly towards the strangers. Without undue haste he advanced, halting every now and then to sniff for the scent again, proceeding cautiously, not from fear of any bull-elephant that he might come upon, but lest he might startle the new-comers and put them to flight.

After he had gone a mile or two he came upon them—five cow-elephants plodding along in single file. On the back of each one's neck was a curious great hump that stirred and heaved strangely. But, unsuspiciously inquisitive, the wandering tusker went forward to greet them. At the sight of him they stopped, and their humps became more wildly agitated than ever. Then, with true feminine coyness, they pretended to ignore him, broke their file, and strayed off slowly and separately in different directions, halting to pluck a mouthful of grass here, or tear down a leafy creeper there.

Our Samson was skilled in the ways of the females of his kind. He had won the favour of many of them in his time; and he knew that these cow-elephants were not as indifferent to him as they seemed. As the superior male, it behoved him to show as little interest in them. So he, too, checked and began to eat, although he felt curious as to the identity of the strangers. Then, keeping apart and yet together, the six great animals trudged on aimlessly through the jungle, feeding as they went. Whenever Samson approached one of his coy companions she moved away from him; but at once another would come closer to him, as if to attract him towards her. Yet, if she succeeded, her boldness would be followed promptly by a shy fit, and she in turn would shrink away timidly from his advances. First one, then another, of the Delilahs decoyed him to her, only to repulse him and keep him at a respectful distance. But the big tusker was content to be in their company, if not of it, and remained with them. They continued moving on, even when night was beginning to fall.

In the gathering gloom Samson did not notice that one of his charmers had gradually dropped behind. Out of sight, she deliberately halted and allowed the rest to go on, until she was a long distance from them and well out of earshot. Then from the strange hump on her neck came suddenly the cry of an owl. Silence succeeded. The elephant remained motionless. Ten, twenty minutes went by, and again the night-bird

hooted. Then from a few hundred yards away came an answering cry. Again the owl called; and again the reply was heard, nearer this time. It was followed by the noise of breaking twigs and the trampling down of the undergrowth; and through the darkness loomed the figure of another cow-elephant. Once more the owl's hoot and the answer were heard, and the new arrival stopped. On its neck and back were three men, and four or five more stepped from behind it. Then the mysterious hump of the first heaved up and resolved itself into a blanket concealing a man crouching on the neck, who flung the covering off as he sat up.

'Allah be praised!' he piously ejaculated in a low voice, stretching himself. 'My bones ache and my limbs are sore, as though I had *wahee ka durd* [rheumatism]. How I suffer!'

'*Kuch dekkha? Kuch mila?*' ('Have you seen anything? Have you found anything?'), asked one of the new-comers eagerly.

'*Hai. Dekkha aur mila*' ('Yes, seen and found'), answered the *mahout*, or elephant-driver. '*Dhantwullah* [a tusker]. *Pukkha shaitan* [a veritable devil].'

Then, striking his elephant's head with his *ankus*, or iron goad, shaped like the head of a boat-hook, he cried to the animal, '*Buth; buth, Moti*' ('Lie down, Pearl').

The obedient animal sank stiffly down, and the *mahout* slid to the ground and rubbed his cramped limbs. Then, squatting on his hunkers, he cried, '*Arhé, bhai, Man Singh; Khuda ki mihrbani se pani do*' ('Hi, brother, Man Singh; for the mercy of God give water').

He held his cupped hands to his mouth, palms uppermost, fingers to the front, wrists against his chin, while a young Oudh Rajput took down from the newly arrived elephant a *mussack*, or goatskin bag, filled with water, and poured a stream from its nozzle into the hollowed hands. The *mahout* washed out his mouth, then drank thirstily.

'Ah, *bhai*, that is good,' he said.

'What has happened? Tell us, Ebrahim,' said the first speaker.

'Slowly, *havildar-ji*, slowly,' returned the *mahout*. 'Let me get my breath. Twelve hours have I been stifling under the blanket. It is well to be thou, *bhai*, sitting at ease on Gulabi's back, eating the air in comfort, while we smother.'

The *havildar* laughed and came to squat beside him, patiently waiting while the *mahout*, a gray-haired old Mohammedan, slowly unfastened a cloth-wrapped bundle tied to his *kamarband*, or waist-belt, and with much deliberation produced from it the big bowl of a red-clay pipe and some dried leaves of native tobacco. Shredding the latter, he filled the stemless pipe, lit it with a sulphur match, and inhaled the rank smoke with enjoyment.

Meanwhile the rest of the party prepared to bivouac for the night. Some cleared away the vegetation from a space of earth in the open patch of jungle in which they had halted, and lit a fire. Others unloaded the elephant that they had brought with them. First they threw down short chains and lengths of rope, then bundles of ragged blankets and cotton-filled quilts—their bedding. The thick cord surcingle that bound the big, straw-packed pad on the beast's back was loosed, and the pad itself allowed to slip down to the ground. Then the hind-legs of both elephants were shackled to trees close by, and the animals left to browse contentedly on the lower branches and the long grass within reach of their trunks. Each man squatted down and opened a little bundle that he carried on him—a cotton handkerchief containing his pipe, tobacco, *chupatties* or flat cakes like thick, leathery pancakes, some handfuls of parched grain, an onion or two, and a few chillies. The Rajput went round the group with the *mussack*, pouring water into the hollowed palms of the various members of it. Then in native fashion each man turned away from his fellows and ate his solitary meal, conveying the grain to his mouth by his hand and tearing the tough *chupatties* with fingers and teeth.

(*Continued on page 376.*)

THE JUNGLE.

A PLACE where shadows, strange and huge, hang
heavy like a mist,
Where, round a myriad ghostly trees, lianas twine
and twist,
And where the light of heaven is lost, and each
thing seems to sigh:
The world without may change, but yet immut-
able am I.

A place where echoes, thundering forth, sound like
an unseen doom,
And monkeys' chatter rings out shrill across the
far-spread gloom,
But where deep silence reigns withal, and breathes
the eternal sigh:
The world without may change, but yet immut-
able am I.

A place of fever-haunted swamps, and rivers cruel
and vast,
Where crocodiles keep hidden watch, and gorgeous
moths flit past,
And hot winds, like a scorching breath, bear on
the forest's sigh:
The world without may change, but yet immut-
able am I.

And while Time moves across the world, and
brings decay and rust,
While men live and die, and nations rise and pass
again to dust,
Unchanging is the jungle's heart—and endless is
its sigh:
The world without may change, but yet immut-
able am I.

MALCOLM HEMPHREY.

GARDEN EXPERIMENTS.

SOME ADVENTURES IN FORM AND COLOUR.

By Edwin L. Arnold.

FEW, even of those who love their gardens, recognise what accommodating things fruit and flowers are. By the exercise of a little art they can be made to take all manner of forms or colours nature never intended, and, since vegetables presumably have no emotions, our consciences may be easy in experimenting upon them. There are possibilities in this way as yet undreamed of. What we already know has been mainly discovered by chance; how much more we might find by further research can only be guessed at. Meanwhile those who admire novelties, and have time at their disposal, can try some harmless tricks upon old favourites, the results of which will astonish the uninitiated, and be interesting, even if they do not add much to our permanent resources in beauty or utility.

There is, for instance, that charming firstling of the year, the hyacinth. Very curious colour combinations, apparently springing from the same root, may be easily reared by any amateur. In the planting season two sound bulbs, destined to give blooms of strongly contrasted hues, are chosen, and each bulb is carefully divided by a sharp table-knife down the middle, near the centre, but without hurting the actual heart. The core-bearing halves of the two bulbs are then bound together with bast and planted in the ordinary way. In due time they amalgamate and blossom in a spike of multi-coloured flowers growing on one stem. The same idea might be carried out with many other bulbous-rooted plants.

Somewhat similar effects may be produced by grafting different-hued roses on a common parent stem, care being taken that they are varieties which bloom at the same season. The sight of a well-grown standard rose-bush carrying red, white, and yellow blossoms simultaneously never fails to excite the wonder of those not well versed in horticultural matters. This is a device needing some little time to perfect. Quicker colour curiosities are produced in other ways. The tints of soft-stemmed flowers may be altered in an hour or two by taking advantage of the rapidity with which they absorb moisture. If a bunch of fresh-gathered lily-of-the-valley, or of white violets, for instance, be set in a bottle of red ink, the flowers blush a delicate crimson before the evening, and continue fresh as long as if placed in ordinary water. White carnations become green in the same way if placed in suitable ink. The coloration of all flowers is closely associated with the sources of their nourishment. An ordinary pink hydrangea takes on a cerulean blue if rusty iron scraps are placed among its roots, and many wild plants vary in response to the nature of the soil they grow in.

Form as well as hue may be influenced by the gardener's art. The common violet grown as a 'standard' makes a dainty little instance of this. A strong plant of the popular spring favourite is chosen, and every shoot removed save the longest runner, which is tied firmly to an upright stick, all side buds, except three or four at the top, being taken off. Under such treatment in due time a neat mop-headed bush, eighteen inches or two feet high, is produced, covered with sweet-scented flowers not less attractive for their novel position.

Very queer pranks, again, can be played with the grafting-knife and the training-stick on the cactus. Most plants of this family coalesce readily with near relatives, and not only may rainbow mixtures of colour be brought about, but weird combinations of form may be obtained well calculated to puzzle the scientific botanist. A globular cactus growing on top of a naturally straight one, or supported on three dissimilar 'legs,' like a vegetable milking-stool, illustrates this kind.

Nor need the gardener's adventures be purely whimsical. Thus, we still go to great expense in the erection of forcing- and hot-houses, but few people know that peaches, plums, and many other fruits may be ripened twice as early as would naturally happen, by the simple means of making a cut all round through the bark of a fruiting branch. This seems to concentrate the sap on the fruit, with remarkable results. Gooseberries, again, are thirsty things, and any one who wishes to astonish the judges of an agricultural show may do so without difficulty when the secret of 'the big gooseberry' is known. If the dry points of a few of the pendent berries be cut off, and a pan of water placed directly under them, so that they are just touching it, they will drink greedily, and increase to an immense size in a short space of time.

Gourds are other thirsty things, very soft and ductable when growing, but hard of rind when mature. Advantage is taken of this in the East to make them into water-bottles of many different forms. A broad tape is tied round the young fruit where the neck is to be, the gourd developing on either side of it. Or a flat-sided or square bottle can be got by enclosing the plant in pieces of board. This is the secret, also, of the 'square' bamboo, which always fetches fancy prices when made into walking-sticks. When the gourd is ripe and has turned yellow, a round hole is made at the top, whence the seed is extracted with the help of water and coarse sand, a light and most enduring vegetable flask resulting. The well-known loofah

washing-pads are simply the hard inner structures of gourds from which, while still green, the flesh has been boiled away.

If English sunshine will not always ripen these Eastern fruits, it will play into the hands of the experimental horticulturist where our native plants are concerned. Pretty sun-pictures may be made on apples in a very simple way. Initials, or profile silhouettes, say of some celebrity or favoured individual, are cut out of soft, dark paper, and pasted to the sunny side of the fruit when it is beginning to change colour. If the paper comes off, it can be replaced without much difficulty. The ripe fruit, when picked, will be found to bear a clear design in yellow on the natural ruddy ground-colour, and not every one will guess how it came there.

Even without sunshine interesting experiments are possible at any time of the year by taking advantage of the way in which temporary growth will be promoted with the help of water alone. An acorn suspended by a thread over a tube of water on the mantelpiece will, in course of time, throw up a charming little oak-tree, and ears of wheat with their stalks in moisture quickly develop a bunch of delicate green filaments. Balls of clay, with a hollow at the top to contain water, can be made to grow small ferns, or seeds embedded in their surface while soft. Chestnut or blackthorn twigs, brought into the house when in earliest bud and stood in water in a warm place, grow and develop leaves or flowers weeks ahead of their season in the open. Every schoolboy knows mustard-and-cress is grown anywhere at any time between layers of damp flannel. Indeed, it is said the late Lord Kitchener, possibly remembering early experiments of this kind, once astonished his guests by extemporising a verdant lawn of these two little salad plants on an Indian desert where he was camped—an ingenious but expensive achievement. Russian girls who own no greenhouse often appear with freshly opened roses in their hair at Christmas. The buds have been picked in summer and preserved in salt, after sealing the cut ends of the stems with melted beeswax. Warm water will induce them to open many months afterwards.

Curious things may also be done by the ingenious with trees, but these being of slower growth, much greater patience is needed. Those, however, who have settled country quarters and can look ahead a few years may find a good reward for enterprise in this direction. Dwarf trees, with all the appearance of extreme age, yet only a few inches in height, have been very popular lately, the prices paid for striking specimens—chiefly under the impression that they were really fifty or one hundred years old—being remarkable. Probably few of the dwarfs thus sold had attained any such age. Very creditable little marvels of the kind can be reared in two or three seasons, the whole secret lying in root-pruning and in giving only just sufficient water to keep the trees alive. A dwarf can even be grown in an orange-skin!

For this purpose a round hole is cut at the top of an orange, and through this the entire contents are extracted. The interior is then filled with one of the preparations used for growing bulbs in pots, stiffened by a little loam and a few fragments of charcoal. An acorn, blackthorn, or other seed is then planted in the centre. In course of time a stem with leaves will rise through the hole, and roots pierce the rind below. These roots must be constantly pinched off flush with the skin as they appear, and the soil kept very slightly moist. In two years the 'tree' will be five or six inches high, and will possess all the appearance of having braved the gales of a century. The same result can be attained more conveniently by growing the seed in thumb-pots and lifting out to pinch the roots at intervals without disturbing the hardened soil. Severe root-pruning is the whole art, the most effective results being obtained with trees of a kind having small, hard leaves and naturally rugged bark. I have seen good specimens of miniature oaks and firs growing on Scottish mountains in crevices of rock where their lower growths were completely cramped. Root-pruning to a more limited extent is also invaluable for aiding the production of fruit. Gardeners of the next generation will probably use the knife below ground more than above it, and to their immense advantage.

Topiary is quite a different art from the above. It consists merely in assiduous clipping of shrubs, generally yew or holly, into fantastic forms, and was introduced when Dutch gardening became popular in this country.

Those who own patches of woodland or shrubbery may find a good deal of amusement in growing queer walking-sticks. As the twig is bent, so, to amend the proverb, will the stick develop. Brass curtain-rings slipped over the head of very young and straight holly saplings, and pressed down level to near the roots, will in course of time become embedded in the bark, the young tree being then cut off below them, and trimmed and dried with its strange ornamentation in position. Close-growing chestnut-shoots may be stripped of lower twigs and plaited, a woven stick resulting, such as could not be produced by any other means. A long tape wound spirally round an ash-shoot gives a naturally carved stick, often of a very satisfactory kind; and other developments in the same direction will readily suggest themselves to the ingenious-minded.

We are only at the beginning of understanding the vegetable kingdom. Our horticulture is still conducted on prehistoric principles, and though the experimental gardener may often be laughed at, the future may owe him thanks for discoveries which would never come without the aid of imagination and enterprise.

'WITH THEM IN SPIRIT.'

By Frank H. Melland.

I.

ERICK'S camp was only a small one, consisting of two large round huts and some smaller ones, all roughly built of wattle and daub, with no proper windows or doors, and no trace of comfort. It seemed in many ways typical of the corner of Africa in which it stood —a corner where three European protectorates meet, wild and undeveloped. The owner thereof was a Dane, a small, quiet man with the habits of a sailor, who made a precarious livelihood by trading with the natives. His name, or at any rate the name by which he elected to be called, was Erick, and he lived there all alone.

The sun had set; there had been no dusky customers since four o'clock; so Erick closed the hut which served as a store and moved across to the one in which he lived. Everything was quiet, the murmurs of his 'boys' at the back of the compound being the only sound in the still air. He smoked idly on his veranda for a time, and then whistled for his dog, but pulled himself up sharply, remembering that the poor beast had been poisoned three days before.

He felt very lonely, this son of Denmark, alone in an alien country, and separated by several hours' walk from the nearest camp of the Government officials; the natives in the district were unsettled, and he mechanically fingered the revolver in his pocket to comfort himself. Wearily he thought of the fortune he hoped to make, and wearily regretted the sailor's life that he had left.

Noiselessly the unshod 'boy' who ministered to his wants appeared behind him with a bottle of whisky, a water-cooler, and a tin mug. Erick started nervously at his silent approach, but immediately felt ashamed of himself. Why was he so nervous? he wondered. Was there trouble in the air?

Now Erick did not drink; he had not fallen to that temptation. As a rule, he did not even take the almost universal 'sundowner,' for he felt that he could not afford to spend his very meagre profits on luxuries. But since his dog had been poisoned he felt so much alone that he indulged in one drink of an evening; so he sat down on his camp-chair and poured himself out a tot. His pipe had gone out, and he relighted it; but it was soon finished, and then he remembered that he had left his bag of Magaliesberg tobacco in the store.

'Boy,' he called, 'bring the lamp.' And when his order had been obeyed, he stepped across the compound to the store. He thought he heard something creeping about, and sent his 'boy' to look; but the report was reassuring.

'I saw nothing, heard nothing, *bwana*. Perhaps it was a jackal or a wild cat.'

Erick thought that it might be nerves, but said nothing. He got his tobacco-bag, went back to his dwelling-hut, and brooded long as he slowly sipped his drink. There was no doubt about it, he had a bad attack of African neurasthenia, that creeping malady which sometimes attacks the lonely dweller in the heart of the continent; it is hard to shake off, and frequently leads to suicide, unless its victim can take a trip home, or, at least, a jaunt to some centre of civilisation.

Time passed, and six o'clock became seven, and seven eight, before Erick roused himself and went inside, to sit down to his supper of stewed fowl, sweet potatoes, and a little bread-and-jam, washed down by a cup of tea. The hut was depressing, the food likewise, and he was glad when the 'boy' cleared away and left him to his pipe. But he felt restless; he did not like sitting there in the lamplight, with his big calico windows forming a poor protection from the outside world, and so he decided to turn in. His bedroom was separated from the sitting-room by a bamboo partition. Here the calico in the window was half torn away, and Erick determined that he would mend it the next day, or, better still, put up some boards.

He placed the lamp on a packing-case by the side of his bed, and sat down on a corner of this native-made couch to take off his boots. One was off, and he was struggling with a knot in the lace of the other, when there was a flash and a loud report, and the room was filled with smoke. Erick fell forward with a big copper bullet in his back. He raised himself and pulled his revolver from his coat-pocket. He saw three faces at the window, and two muzzle-loaders resting on the sill, pointing at him. He raised his arm to fire, but another bullet got him in the chest, and his shot went high. Half-sitting and half holding to the bed, he fired again through the smoke, and was met by another explosion, but the bullet missed him. He fell back on to the bed. Life was ebbing fast. The revolver dropped from his grasp, and he lost consciousness.

II.

At 2 A.M. the same night Ferguson, the magistrate at Kabinda, was awakened by his 'boy.' He got up with a start

'Who's there?'

'It's me, *bwana*—Malijani,' said the 'boy.' 'A white man has been shot.'

'A white man shot! Who?'

'Erick, *bwana*. His "boys" have just come in from his camp to say that he has been

shot in his bedroom by the Bakaleba, and is dead.'

Ferguson got up, looked at his watch, and meditated. A dark night, no moon, and no road—it would be quite futile to start off before daylight, when they could see to cycle through the bush. No need to disturb the others yet, so he turned to Malijani.

'Take the "boys" to your hut. Don't say anything to any one, but be ready to cook breakfast for three at first cockcrow or earlier. I will call you.'

Further sleep was impossible; and, anyhow, he had been in bed before ten, so he did not mind much. He put a slip-on over his pyjamas and went into the sitting-room. Then he filled a pipe and mixed himself a whisky-and-soda. Thus, thinking of the tragedy and pondering over the unrest in his district, he waited till half-past three, when he called up the sentry, walked across to Captain MacAdam's house at the police camp, and roused that officer from his sleep. He told him what he knew of the tragedy, and that he would expect him to breakfast at four; after which, at the first peep of dawn, they would start off. As a preliminary step, MacAdam sent off half-a-dozen police towards Erick's place with the dead man's three 'boys,' while Ferguson moved on to the quarters of Evans, the Assistant District Commissioner, and then went back to dress and order breakfast.

At four o'clock these three forgathered and ate their breakfast. Conversation was carried on in whispers, though why no one knew. Then young Blakenthorpe, the subaltern of police, and Sergeant Cross came along to see them off. So, in the gray light of dawn, the three mounted their bicycles and rode off into the forest. Each of them had a Browning pistol ready to hand. It was not long before they overtook the detachment of native police, and at seven-thirty they rode into Erick's compound.

All was still, and not a soul was near. They opened the door and walked in. The door gave on to the sitting-room, and, seeing nothing there, they went into the bedroom. The sunlight was streaming in through the torn calico of the window, and on the bed lay what had been Erick. He was quite cold. Two gaping wounds—either of them fatal—showed the havoc wrought by the rough bullets. His revolver lay where it had fallen.

Ferguson walked round the room, examining it carefully. He found the hole where the third bullet had hit the wall. Then Evans's voice broke upon the still room.

'Oh! look here, Mr Ferguson,' he called. 'Look! this is where they fired from.'

He was standing by the window, and there, on the dust on the rough window-sill, were marks where the barrels had rested. Outside they found footprints leading to a well-beaten path on the north-east; that was all.

'Oh for some bloodhounds now—it would be our only chance,' said MacAdam. 'We must try, though, somehow to get the ruffians. Why should they kill poor Erick? He was harmless enough. Never had any rows with them, did he?'

'No,' said Ferguson. 'They seemed to like him well enough. I don't know that he ever had a row with any one. I don't expect it was personal at all. The murderers were probably some of those discontented people who object to our rule, our taxation, our administration of justice—everything about us—and mean to try to get rid of the white man altogether. Erick happened to be the easiest man to get at—practically defenceless—so they chose him. At least that's my theory, and to one knowing something of the simmering discontent that is about in the land it seems the most likely solution.'

'Was he married?'

'Not to my knowledge.'

'But he was engaged,' put in Evans. 'He told me so one day. That's why he left the sea—to try to make enough money to marry on.'

'Poor devil!' said Ferguson; then, 'I say, MacAdam, I don't see that we can do any more. Will you take careful note of the wounds, position of the body, distance from the window, and all that sort of thing? And when your police come along we can take him to the *boma* and bury him.'

So all that remained of Erick was committed to the earth, and Ferguson read the burial service, held an inquiry, wired to Headquarters, and otherwise fulfilled the routine that such an occasion necessitates.

And then the hunt began.

III.

Ferguson never caught the murderers, though he was sure of their identity—a gang of three lawless men who fled into the bush. He arrested certain relatives and headmen on a charge of being accessories, and harried the country-side with police and raw levies. He knew that the murderers had not bolted into foreign territory, and was continually hearing of them, but the district was full of their friends, so the Government got little but false rumours concerning them; and often his own levies proved none too dependable. For two months he devoted himself entirely to this work, now with MacAdam, now with Blakenthorpe, but he never got a chance of apprehending the fugitives.

Evans helped his chief all he could, but there was plenty of other work to be done, and Ferguson had to give up the active search in time, though he did not give up hope. The natives noticed a harder look in his face, and many felt sorry that the black man had won

this trick, and feared for the game. Others, however, chortled, and boasted openly that they would drive the white man from the country.

The company of police stationed at Kabinda was not augmented numerically, but its efficiency improved. Bad shots and doubtful characters were drafted to other companies, while good shots—trained men who had seen war—took their place. More ammunition was spent on the range, and machine-gun practice was no longer intermittent.

So, with a firm hand and incessant patrolling, the district was kept quiet. Ferguson knew what to do, and his subordinates helped him—the taxes were collected, the roads kept up, and the ordinary district work went on. Laws were obeyed more or less, even if somewhat sullenly, and the smouldering fire was kept under. Several other malefactors were captured. Some were hanged, and others went to jail; but still Erick's murderers were at large.

It was a year later that Spillsbury came up and took over the command from Ferguson, who went home. He needed his furlough badly, and knew it, so he did not delay his departure; but he was sick at heart at having to leave the poor little storekeeper unavenged. His last words to Spillsbury were: 'I do hope you get them, Spillsbury; not only get them, but try them—and hang them *here*. The moral effect would be half lost if they were hanged at Headquarters. If you do, you can think of me wishing that I were here to take a part—but I'll be with you in spirit, anyhow.'

IV.

It was four o'clock on a Saturday morning. Ferguson was walking back from a ball at Covent Garden. Some friends of his had arranged a big party, and he had gone with them. He had done his best to be merry, but it did not seem like the Covent Garden that he had known of old. One and all appeared so much younger than they used to be—or was he so much older? He had been bored at a *revue*, and found supper too boisterous; while the ball itself seemed deadly dull, and the four hours he had spent there had bored him to distraction. Just before the end, feeling that he was out of his element, he slipped away. No one noticed his departure. Choosing to walk, he went slowly and meditatively, and by the time he reached Long Acre he felt a little better.

He reached Stanford's shop—the home of maps—and his thoughts went back to Africa. Then, suddenly, as he walked, the scene changed. He saw before him not London, but a scene in the African forest.

'Good heavens!' he cried to himself. 'It's Kabinda! Yes, the police camp; but it has changed. What on earth is that big fenced compound? I wish the light were clearer, so that I could see it properly. There's—who's that? It's Evans, and Blakenthorpe—in uniform, too—and old Sawbones. What on earth are they doing out at this hour?'

As he walked on he got no nearer, but he did not seem to notice that: he only saw that it was getting lighter, and that the picture grew more clear. The little group of white men began to stir and look round. His eyes followed theirs.

'Ah! here's old MacAdam, and Spillsbury, too. Good Lord! and nearly all the police.'

Then he looked again at the compound. It was daylight now, and above the bamboo fence he saw the top of a scaffold; and then he understood.

'Thank God! they have got them. That must be it. *That* must be for the men who did for Erick. And here come all the Bakaleba chiefs, to see that we *can* avenge. Good—good! Well done, Spillsbury; well done! Here's old Cross with the blackguards. One—two. Two only? Surely they haven't let the third slip through their hands? No, they can't have; he must have been shot resisting, or escaping, or something like that. That's right, they won't be long now. They're all trooping into the compound. They're all in now. I'll bet those Bakaleba are feeling pretty bad, realising a bit what Erick felt when he struggled to use his revolver. How much longer? I wonder. . . . Good heavens! What's that?'

'That's what I want to know, sir. Where are you going?' asked a burly constable at the top of the Haymarket. 'Can't you see where you're going?'

Ferguson pulled himself together. 'It's all right, sergeant,' he said. 'I'm not drunk. I was only dreaming.'

'Well, sir, bed's the best place to dream in at this time of the morning, I should say; but I hopes they was pleasant dreams.'

'Very; thanks. I dreamt I was waiting for two murderers to be hanged, and you interrupted me just too soon.'

'What! them Smith Street murderers? They won't take the jump for some time yet.'

'No, not them. I didn't realise it was their morning, too.'

'Are there any others, sir? I hadn't heard of them.'

'No, you wouldn't. It isn't in England; but there is another couple just going before the Final Court of Appeal, all the same. Good-night, sergeant; good-night—or, good-morning.'

'Good-morning, sir,' said the bobby, and went off ruminating. 'Funny sort of chap that is. Wonder what he's talking about. Walking about Piccadilly Circus, dreaming of murderers and hangings. Looks as if he'd been in India, or some of those parts. Wouldn't be surprised to hear he'd had a touch of the sun; that I wouldn't.'

Ferguson walked to his rooms in Jermyn Street, and had a tub. As soon as any one was astir he left word that he would breakfast at his club, and walked out. He walked down the Haymarket and turned into Charles Street. The telegraph-office was not open, so he continued his walk; but, ending up nowhere in particular, and near no office that he knew of, he turned back towards Pall Mall, and on to the club that he usually frequented in St James's Street, determined to send off from there the cable that he had planned. Noticing, however, that the St James's office had just been opened, he stepped in and started their business for the day. Taking a cable form, he wrote: 'Spillsbury, Kabinda. Hooray. Ferguson.' And then, with a sigh of relief, he walked up the hill.

For the second time that morning suspicions as to his sanity arose—this time in the mind of the telegraph-clerk.

V.

About midday, when the newspaper-boys were making the streets hideous with their cry of 'Hanging Speshul,' the African mail came in, and brought a letter from MacAdam, telling him of the capture.

'One of the blighters'—the letter ran—'became a fair terror, and used to loot everywhere. They had their women with them, and were in that big swamp on the Lukulu River, though, of course, we didn't know it. They lived on forced contributions, and threatened to blot out any one who gave a hint as to their whereabouts. One day Shiburenga, who had made himself a sort of ringleader of the refugees, had a row with his wife, and shot her. The news leaked out, and her brother heard of it. He came along and told us where the hiding-place was. We went out—Spillsbury, Blakenthorpe, and I. Evans was down with fever. He wanted to come too, but old Sawbones was adamant, and kept him in bed; thinks it's spotted fever, but hopes it isn't. We went by different routes. Spillsbury went one way, ostensibly to investigate a bad witchcraft case *in situ*; while B. and I pretended that we were just off on an ordinary patrol. On the third day we converged, and met at night about ten miles up-stream from the hiding-place. We surrounded the place and waded in. It wasn't very pleasant, as we had no canoes and had to mess through as best we could. An ambush could have blotted us out. We had a machine-gun with us, but it was absolutely useless, and a poisoned arrow was as good as, if not better than, a rifle.

Luckily the party had no suspicions. The raid had been planned quietly, and the girl's brother had been too scared to let any one know that he had sneaked. We got safely to the island—a stinking mud flat smothered in reeds—well before dawn, and started lining up the police all round it. The girl's brother knew where each member of the gang slept, and there were only four lean-to's, anyhow. Leaving the police in reserve under B., Spillsbury and I, with a small fatigue-party, crept up and started pulling the lean-to's down, right on the slumberers. That prevented them from using their gas-pipes on us. They got so mixed up that they were helpless, and we got two of them pretty easily, and clapped irons on them. Never fired a shot, though we had our Brownings handy. Our guide, however, grabbed an old nipple-gun and let fly at nearly point-blank range on Shiburenga, getting him in the stomach. We hope to save him, but I'm afraid he'll cheat the gallows after all. However, he wasn't the leading spirit in Erick's murder; that was Mubanga. . . .'

And then Ferguson knew that his day-dream was true, though in his heart he had never doubted it.

VI.

Late afternoon again, and the same day. On Spillsbury's veranda at Kabinda he, MacAdam, a convalescent Evans, Blakenthorpe, and the doctor were having their 'sundowner' and quinine. It was a bit early for the evening drink, as the sun wouldn't be down for an hour or so, but it had been a trying day, and they were still talking of the morning's gruesome work. Suddenly Sergeant Cross—who acted as postmaster—came down the path and saluted.

'Telegram for you, sir,' he said to Spillsbury. 'I thought I'd bring it down myself, because it seems kind of uncanny, sir.'

'Heavens!' said Spillsbury, after reading the message; 'it's a cable from Ferguson, handed in at St James's early this morning.'

'What's in it?' chipped in MacAdam anxiously. 'Nothing wrong, I hope.'

'Only one word, "Hooray." Do you remember how he said he'd be with us in spirit?'

'That's why I said I thought it was so uncanny, sir,' said Sergeant Cross.

EVENING—PORT-APPIN.

ABOVE, two heavy-winged herons fly;
A white owl, silent, fades before our eyes
Into the cliffs; a curlew's plaintive cries,
Notes loved of loneliness, unanswered die
On the still air; against the amber sky
The Morven hills in guardian calm arise,
As, hushed in sleep, fair, holy Lismore lies,
Dreaming of powers and majesties gone by.

We watch till stars shine from the water's face;
Then, suddenly, a peace beyond our ken
Enfolds us, vast, complete; as if in space
Uplifted, far remote from things of men,
Alone and unafraid, we twain did stand
Before the Power who leads us hand-in-hand.

E. E. DOUGALL.

THE VINTAGE IN PIEDMONT.

By EUSTACE REYNOLDS-BALL, F.R.G.S., formerly Editor of *Travel and Exploration.*

I.

THE *vendemmia* (vintage) usually takes place between the 15th and the 30th of September. The observant pedestrian will see signs of the approaching harvest in the closing of the short cuts through the vineyards, and the erecting of rough fences, protected with wire, to keep off trespassers. In one case I was amused to notice that a discarded telegraph-line had been looted for this purpose.

The pleasing pre-war custom of allowing passers-by to help themselves, on asking formal permission, no longer obtains. This is not surprising, when it is remembered that grapes now fetch per *myria* (ten kilogrammes) as many lire almost as they formerly fetched soldi.

Off the main highway one will occasionally see an old coat hung at the end of a row of vines abutting on a lane or a mule-path. This is not intended as a scarecrow, but left permanently by the simple-minded peasant-proprietor, in the fond belief that the passer-by will imagine the owner is working in his vineyard, and that, therefore, he will refrain from pilfering the grapes. As this little dodge is universally known, it is seldom efficacious.

A generation or so ago the vineyard-owners did not go to the expense of elaborate fencing, but were satisfied with guarding the vineyards at night, during the weeks immediately preceding the *vendemmia*. The little huts or shelters one still sees plentifully scattered among the vineyards were used for this purpose. In such a lair would lurk at night the proprietor, armed with an old-fashioned blunderbuss loaded with rock-salt for the benefit of marauders. More damage would probably result to the owner than to his intended victim if the antique weapon were discharged. An equally primitive method of guarding the vineyards when the grapes were ripening was employed in Tyrol in pre-war days. The vineyards used to be guarded by a singular figure (garbed in a huge head-dress of feathers, and armed with a halberd or some other fearsome weapon), who was licensed to levy a fine of ten kreutzers or so on trespassers. This individual was known as a *saltner*. There is a legend—though I cannot vouch for its accuracy—that an innocent English tourist once took this perambulating scarecrow for a brigand, and was amazed at being let off with a ransom of a few coppers.

In the Rhineland districts the regulations with regard to the vintage were, before the war, at least, absurdly rigid. It is said that when the grapes were almost ripe, no one, not even the owner, was allowed to enter the vineyard till the signal was given by the local authority—the idea, presumably, being that all might start fair.

II.

In the last week of September, all along the roads leading to Alba, the capital of the vineyards district, passes an endless procession of vehicles carrying the precious produce to market. They are laden with all kinds of receptacles full of grapes, from huge oblong vats called *arbi* (unpleasantly like coffins) and barrels down to small two-handed tubs, hampers, and baskets.

Ox-wagons are in the majority, but there are many mule-carts and donkey-carts, though few horse-driven vehicles. The ox-wagons are, of course, a picturesque and characteristic feature of the country-side. There is something peculiarly fascinating in the dignified gait of these huge, patient, docile beasts, with their large seal-like eyes and their placid expression. Unlike horses, and, indeed, most draft animals, they will make way for no pedestrian, and should you be ill-advised enough to ignore them and refuse to make way, they are apt to give you a reminder by a gentle shove with their muzzled snouts. Although their pace never exceeds two miles an hour, they will often cover in the course of a day's journey some twenty or twenty-five miles.

Considerable skill is required in the loading of these *arbi* for market. When they are full up to the brim with bunches of grapes, the loader presses them down by means of a short plank, on which he jumps, going from one end of the vat to the other. By this means the grapes are pressed down without being too much crushed. Then one or two layers of uncrushed grapes are placed on the top, and the vat is covered with tarpaulin or sacking, and carefully roped.

At the market-town the prospective buyer is usually satisfied with raising the covering at one end only, being quite aware of the ingenuous practice of placing the finest bunches on the top, according to the time-honoured custom of Covent Garden. On an average seven *myrias* of grapes will make about a *trenta* (fifty litres) of wine, which is about enough to fill seventy-five ordinary pint-bottles.

Old residents in Piedmont are regretfully alive to the significant change in the character of the *vendemmia* nowadays, compared with what it was in pre-war times. Formerly the grape-harvest was in great measure a kind of *festa* confined to the family; but now, owing to the terrible losses caused by the war, the peasant-proprietor of the vineyard has to supplement

his sons' and daughters' labour with outside aid, and *manuales* (day-labourers) are employed. They are paid about seven or eight lire a day, and are fed and lodged by the employer; or, to be more precise, they bring their own bread, but are provided with wine and grapes *ad lib.* by the employer. Indeed, the *vendemmia* is for the *manuale* a kind of grape-cure. There is a great variety of grapes grown in Piedmont, producing the various brands of wine.

There are the cheaper kinds: Dolcetti, Freise, Neirani, Americani, which make the *Vino da pasto*, corresponding to the French *Vin ordinaire*. Then there are the choicer kinds, which produce Barbera and Asti Spumante (white), and the Nebiolo grapes, from which the famous Barolo brand is made. The Barbera and Barolo wines are the only kinds exported (after being duly fortified), and these are the only brands familiar to English consumers.

III.

Though the highly scientific methods of culture adopted in Burgundy and the Bordeaux district are not practised in north Italy, yet the vine-culture demands considerable technical knowledge and skill on the part of the Piedmontese *viticulteur*. Except during the winter months, hardly a week elapses without something having to be done to the vines. The expert knowledge possessed by these peasant vine-growers is astonishing. Suppose cuttings were taken, say, from a dozen different species of vines, they could pick out unerringly each particular kind.

When a vine grows old and requires renovating, it undergoes a curious and elaborate process. A long, deep trench is dug along the side of each row of vines, and each vine is pressed down along the bottom of the trench, and then covered with *fascini* (bundles of brushwood) and earth, until the top of the trench is level with the surface. But an upper shoot of each vine is allowed to protrude above the surface, and from this shoot springs the new vine.

The *fascini* are sometimes put in ponds to soak before being placed in the trenches.

These pits in which the *fascini* are soaked are apt to prove a snare to the unwary trespasser in the vineyards. These are often dug close to the path, and the top, flush with the surface, is loosely covered over with brushwood and earth. If an unfortunate tourist trod on this fragile roof, he would not only get a ducking, but might have some difficulty in extricating himself. The picturesque, if insanitary, custom of treading out the grapes with the naked foot is still adopted by the smaller cultivators; but generally a machine is used, which works on the same principle as a coffee-grinding machine.

The process is as follows. The grapes are brought on an ox-wagon in one of the huge vats already described. They are then pitchforked into the feeder of the crushing-machine, which is intended only to breach the skins, not to crush the grapes, the latter process being a subsequent one. The handle of the machine is turned by a boy, and the bunches of grapes fall from the machine into a second *arbi*. The contents of the vat are then put into a large barrel, and allowed to ferment for five or six days in the cellar.

After the wine is drawn off, the grapes and stalks which remain in the barrels are put into a special crushing-machine called a *torchio*, a wine-press, which presses the grapes far more effectually than the coffee-grinding machine used in the first instance. This wine is put aside in a separate barrel, as it is usually thicker and stronger, owing to there being more alcohol in the stalks of the grapes. It is a rougher and headier wine than the other. It goes through the same subsequent process as the other wine.

The wine is now drawn off and put into a large barrel for six months. It should then be clear. It is next drawn off into another barrel, so as to get it clear of any sediment. (Should it be left too long in the first barrel, there is a risk of its fermenting again on the approach of the hot weather.) It is then bottled. The second quality wine, which is not, as a rule, sold, but is drunk by the wine-grower and his family, is made from grapes discarded when picking. For no grapes are wasted, and the unripe and rotten grapes are put into a second tub, kept for that purpose, when the grapes are gathered.

But there is even a third quality of wine made, for the frugal Italian peasant wastes nothing. After the grapes have been put through the *torchio*, water is thrown on them and left ten days, so as to let the mixture ferment again. This will produce a fairly strong wine, which the peasants drink freely when working in the fields. This wine is usually carried in bottle-shaped gourds.

The above remarks apply only to red wines, the manufacture of white wines entailing a far more elaborate and cumbrous process.

As might be supposed, white grapes alone are used, of which the best-known varieties are Grignolino, Muscatel, and Danascitto, from which are made the well-known brands, Asti, Canelli, and Muscato.

As a rule, the smaller cultivators do not attempt the making of white wine, owing to the trouble entailed and the cost of the appliances. There are several stages in the process. The great difference in the manufacture of red and of white wine is that the latter is not allowed to ferment.

The bunches of grapes are put through the *torchio* at once, and then the wine is drawn off into barrels, where it remains four or five days till sufficient sediment is formed. This process

is repeated two or three times to clear the wine still more. Finally, it is filtered by being passed through glass funnels, in which absorbent paper has been placed to catch any sediment which may still remain. If this filtering is not sufficient, gum or white of eggs is introduced into the barrels to precipitate the sediment. The wine is now fit for bottling.

MAN'S WORK.

By ALAN SULLIVAN,
Author of *The Passing of Oulibut, Blantyre-Alien, The Inner Door*, &c.

CHAPTER XIV.

I.

AT five o'clock on the morning of the 29th Harrison swung his feet to the floor and stood stiffly erect. He listened a moment to the thump of the engine, then went into the cook-tent, where Gertie, her hair in a tangled mass on the top of her head, stooped over the stove.

'Coffee, dad? It's waiting for you. Jack has just had his.'

He sipped it, regarding her thoughtfully over the rim of his cup. Her eyes were shrunken, and smarted like his own, but her youth had come triumphantly through the last three weeks. She had infused a different spirit into the camp, and caught light-heartedly at anything that would ease the burden of the day. Suddenly he wondered what would have happened if she had not come. He put down his cup, and his arm went round her shoulders. 'You remind me of your mother, Gertie.'

Her face grew very tender. 'Do I? Why?'

'Always at something for some one else.'

'I began too late, dad,' she whispered. 'Mother began right away. There's a big difference.'

'But you've pulled us through here. Then there's Bill.'

'What about Bill?' she asked teasingly.

'I was going to ask you.'

'He's the finest man, bar two, that ever stepped in shoe leather.'

'That does me good.'

'I didn't say anything about it because—well—this isn't exactly the time for announcements of that sort—but he'll do for me, whether this is make or break. Does that help you any?'

He nodded. 'A lot.'

'You see, if you strike it to-day we can afford to keep house—and, if you don't, Bill is good for three hundred a month anywhere—and that's enough.'

'Ever hanker for the city now, Gertie?'

'Do I look it?'

'No, you don't; but one can't tell.'

'What I had in the city will do me the rest of my life,' she said, almost vindictively. 'I told that to Bill, and he's satisfied. Dad, did you ever think of what Jack stands for in this outfit?'

'I haven't had much time to think.'

'Well, turn it over in your mind. First, he finds this shale; then, because she believes in him, Miss Winter pushes twenty thousand dollars down his throat; then, because he'd done me a good turn, for one reason, I'm glad to help; then Mrs Sitwell comes along with more boodle; then the man that fired him puts up twenty thousand dollars without a quiver. Now, why do you reckon all that happens? Have some more coffee?'

He laughed and shook his head. 'You'd better ask him.'

'It's because there's some darn influence—I don't know what—that, when things happen to decent men, gets up on its hind-legs and says, "This has gone far enough." That's what struck us, right here on this lease. Say, any folks coming out to-day?'

Harrison grinned broadly. 'Yes; some friends of ours and Spencer Martin. Got anything to eat?'

'I'll make some more cookies and a couple of pies. This grate is burned out, but I guess it will do.'

Their eyes met. 'I guess it will,' he said slowly. 'Spencer Martin is due in Los Angeles in just five hours.'

At ten o'clock Edith Winter turned up, sampled the cookies, and glanced interrogatively at the rig. Harrison was still drilling.

'When do you shoot?'

'Three o'clock maybe—not before; plenty of time.'

'Does your heart go pit-a-pat?' she asked gravely.

'It does,' he admitted. 'How about yours?'

'I'd hate to tell you. Are you having a party to-day? Gertie's made all kinds of things.'

'Folks get hungry round noon,' he said stolidly.

'And you propose to feed a man like Mr Sitwell on cookies?'

'There's Spencer Martin, too,' he chuckled. 'City men can put away quite a pile in the country. I'm darn sorry I didn't think of it before. It's pretty plain food.'

'Don't! don't!' she stormed suddenly. 'You make me feel like a brute.'

'What 's the matter, partner?'

'Everything with me—nothing with you and Jack and Bill and Gertie. It 's worth anything to have known you—even if we never strike oil.'

He flushed under his tan. 'You 'd feel the same way if you 'd had to work. Any one would.'

But Edith was not so sure. She watched Gertie laying a table for her enemies with a care she had never taken for her friends. Beneath it were trodden the black cinders of the former camp. There was no question of war or rivalry, but just the unwritten law that those who passed high noon here must eat, be they friend or foe. Gertie examined her work, her head on one side.

'I could do better with a few flowers and some more fixings, but if this place is going to be swimming in oil in a few hours, what 's the odds?'

Edith laughed a little hysterically. 'What about a few orange-blossoms?'

II.

At half-past eleven a big car pulled up, and Spencer Martin descended ponderously from the front-seat. Behind him were Sitwell, Claudia, and Hunt. They talked for a moment; then a little procession struck through the grove. Edith watched them, and breathed a sigh of relief when she saw that Hunt came last. Her heart had grown unruly. Shanklin and Harrison apparently took no notice. The engine coughed steadily. To all outward appearances there was nothing unusual. Denison stood at the door of the cook-tent, with Gertie close beside him.

'Morning,' said Martin.

Harrison and Shanklin nodded simultaneously. There was no handshake; nor did Martin seem to expect it.

'I 'm trespassing,' he grunted.

'That 's all right; make yourself comfortable.'

The big man glanced at the derrick. 'When do you shoot?'

'About three o'clock,' said Harrison coolly, then stared at Sitwell. The latter was biting his lip. 'There 's nothing special to interest you yet awhile, so I reckon we 'll go about our business.'

He turned away, and Martin's small green eyes followed him curiously. Shanklin was staring at Claudia, who looked back, her whole soul in her gaze. It was as though she were trying to explain why she had come. Presently Sitwell began to talk to Martin in undertones. Edith Winter and Hunt had disappeared. A moment later Claudia was beside the man she loved.

'I couldn't help coming to-day—they both insisted. Do you mind?'

He looked deep in her eyes with the blinding emotion that nothing mattered but one great fact. Toil, effort, weariness, and the tenseness of the day were all forgotten. He knew only that he loved her better than his life. Claudia saw and understood, and trembled.

'In a few hours one of us will be rich,' he said shakily. 'I hope it will be you—who need it more than I do. But, whichever it is, I can't stay here, Claudia. It hurts too much.'

'Don't go, Jack. It was all my fault—mine from the start—but don't go.'

'It was no one's fault,' he answered slowly; 'it was all meant to be. You and I hadn't much to do with it. Burley wants me back, but behind Burley I 'd see you. We 're within a few feet of either fortune or ruin; but, whichever it is, I don't complain of the last few months.'

She regarded him steadfastly, and in her eyes he saw that kingdom of his heart to which he had no key. In him she discerned the anchorage which her soul might once have found, but from which the winds of destiny had driven her far. 'It was always you, Jack,' she whispered, 'but I didn't know, till it was too late. There 's one part of myself that no one but you has ever had—my spirit. It will always be yours.'

He bent his head as though to some invisible caress. It was the world of men for him now, with her sanctuary in his breast.

They turned and went slowly back, each dumb with a consciousness that needed no speech. Beside the derrick, Sitwell was standing with Martin, his face drawn and haggard, but a brilliant, restless light in his eyes. He stared at the two, and his lips curved into a strange smile.

III.

Beyond the camp Edith Winter and Hunt sat beneath the orange-trees. Presently Gertie's voice sounded within the cook-tent. There followed a man's laugh. Denison came out and struck at a steel triangle hanging from a post. It gave out a ringing musical note.

'Dinner,' he called. 'Come and get it.'

Spencer Martin roused himself. 'Eh—what 's that?'

Harrison wiped a pair of greasy hands. 'We haven't got but ordinary stuff; but such as it is, you 're welcome.'

The red face turned a darker red, and the big man hesitated for one of the few times in his life. He had not reckoned on this. The smell of freshly roasted coffee drifted out of the cook-tent, and something querulous stirred in his great stomach. He glanced at Harrison almost with respect. 'Don't mind if I do,' he said shortly.

Harrison, left to do the honours—Shanklin having evaded the duty—made a gesture to Sitwell. 'Might as well come in; it don't

make any difference now,' he suggested with a certain grave simplicity.

Sitwell's face began to work convulsively. His eyes turned to Martin's broad back; then, meeting Claudia's profound gaze, he seemed to be struggling with conflicting inward forces. His features were an epitome of surprise, restlessness, and some overbrooding fear. Harrison's voice sounded again, deep and dominant, like the beat of his own machinery. And at that Sitwell followed his master.

The contractor did not sit down, but, drilling his last few feet, watched his guests with imperturbable interest. Spencer Martin, at the end of the table, ate steadily, with an appetite that seemed sharpened by the manner of his entertainment. The small, green eyes missed nothing, and from the big body spread the suggestion that already he controlled not only the ground beneath, but the fortunes of those around him.

Edith manœuvred Claudia into a seat between Hunt and herself, with a queer feeling that the girl needed protection. Opposite her was Denison, who ate with little side-glances at his companions and an occasional squint at Spencer Martin. This was a meal he would remember all his life. Suddenly Martin looked along the table at Shanklin and stared fixedly. He said nothing, being occupied with a sudden reflection that perhaps this, too, was the kind of man for whom he could make a good opening in the oil business. That was one of Martin's strong points—he could appreciate ability in an opponent.

Something in the air got into Gertie's blood, and she surveyed her guests with a quizzical, whimsical consciousness that this was better than a motion-picture. She stepped behind Sitwell. 'Have some more. I hadn't much time to get this party ready, but I'll guarantee the coffee.'

He gulped, and burned his throat, whereat Martin chuckled.

'Matter of fact, you're too kind.' He tried to catch Claudia's eye, and failed. 'I half expected to be chased off this lease.'

Shanklin smiled grimly. 'Some one is going to be chased off. I wonder which it will be.'

Sitwell experienced a cold chill as the green eyes rested on him for a moment. Then Martin laughed outright. He loved a fight, however unscrupulous might be his own weapons, and for Sitwell he held his usual contempt towards those who had failed. As to Claudia—whose husband was in the hollow of his hand—there was no hurry. He tilted his cup towards Shanklin as though in a toast to the victor.

'My compliments to the cook. You must have lived well out here.'

'We've lived hard,' was the significant reply.

Sitwell's voice came in shakily. 'I see you've got two torpedoes ready. Why two?'

'The second will wreck the well—if necessary. Have some more pie.'

There was a little silence, and Edith gulped at something in her throat. She had a weak desire to scream. It seemed that those who had most to lose were the least disturbed. She stole a look at Sitwell, and was amazed to see him regarding Martin with an expression of fiendish hatred. She remembered, once, an animal in a trap, and shivered. Martin ate steadily. There was nothing the matter with his nerves.

'I'll give you five thousand dollars to leave that well as it stands—if it's dry,' he said deliberately.

Shanklin grinned. 'Ask Harrison?'

The big man twisted his body. 'How about it?'

Harrison sent a contemplative glance to the top of the derrick, then stared at the twin torpedoes that lay gray and menacing, their blunt noses needing only the detonators to transform them into engines terrific and irresistible. He fingered the detonators, rolled in a twist of waste in his pocket, and his mind travelled down—down—nearly two thousand feet, to where the remorseless bit still gnawed at the bowels of the earth.

'I'll make it ten thousand,' said Martin.

Through Harrison's veins leaped a sudden fiery flood. The labour, the stress, the sleepless nights, the struggle against unknown enemies who did their work and disappeared in the night, the sight of this man who was at the bottom of it all and yet immune to anxiety and loss, all combined to infuse him with a spirit of utter defiance. No money could compensate for the dull roar and the spurt of flame that would wipe out this arduously performed work, and leave Martin to do it all over again. He admired the man for his nerve, envied him for his power, and loathed him for his methods.

'What would you do in my place?'

'I'd take the money. I never refuse it.'

Harrison recognised the truth. It was Martin's way.

'This time your money isn't any good. Better stand back a——'

IV.

Harrison's sentence was never finished. From the well's mouth came a dull sound, as though, far below, some surviving Titan of the past were coughing as he slept. The dipping cable quivered. The sound grew sharper—hoarser—and from the smooth steel casing came the vicious hiss of air spewed forth at increasing velocity. The solid earth gave a slight tremor. Came a roar, and the bit sailed up, a tangle of cable and scored metal. With it was a column, black, shining, straight, like the trunk of a lofty tree. Column, bit, and cable hit the top of the derrick and tore

through it. There was a crashing of timber, a rain of fragments and shattered mechanism, and high into the stainless air climbed that black trunk, till, a hundred feet up, it feathered out like a gigantic plume, and caught the prismatic rays of the sun, absorbing them in great waving streamers. From the very skies pelted oil, fed constantly by the ebony column, whose bulk seemed every moment to increase. It rained, profuse and prodigal, as though rejoicing that again, after cycles of time, it had found the light. The wind caught it, brooming it out like dark and driven spray. And ever the hidden caverns of the earth yielded their store. There was nothing left of the derrick; the white tents had turned a rusty brown; rivulets of oil were trickling in little newly formed channels towards the ordered lines of orange-trees; and the air was saturated with a strong, sharp odour.

Harrison picked himself up. Martin had staggered back, and was wiping oil and blood from his cheek. The tent emptied itself with a crash of dishes, and Shanklin raced out, his mouth open, but destitute of speech. Claudia's eyes followed him. Edith flung herself into Hunt's arms and shouted unbelievable things that he only half-heard through the steady roar of the gusher. Gertie had Denison by both hands, and danced hysterically with a wild chant of joy and triumph. The place was transformed from a tense arena of rivalry and effort into a paradise that dripped riches on worthy and unworthy alike.

And Sitwell! Sitwell stood, his face transformed, his muscles twitching, his fingers curved like talons. He stared at the gusher with eyes that gleamed with fear and sheer amazement. Thus for a moment, till he caught sight through the black rain of the bulky figure of Martin. In letters of fire there marched through his brain, warped with fraud and futile crime, the warning words of three months ago. At that he put a hand to his head, which was burning, and, with a scream, sprang forward. Through the oil he came, loping like a beast, inarticulate with convulsive lips. Like a beast he sprang and fastened upon the bull-neck of the man he hated and feared. Terror and revenge were in that desperate grip, for he saw himself from now on under Martin's heel.

Under the driving impact Martin went down. The long fingers tightened and sank, while Sitwell, worrying him like a dog, made strange noises in his lean throat. Thus, with the oil they had stooped so far to capture enclosing them like a pall, till the wind shifted and Harrison came racing up, Shanklin close behind. Five minutes later Martin drew a long breath; the blood began slowly to leave his puffed face, and his swollen eyes lost some of their glassy stare. He groaned, and lifting himself on one arm, saw Sitwell, bound but writhing, a thin fringe of bubbles on his bloody lips.

After that it seemed that the lease became suddenly populous with strangers, who raced up from the highway, scrutinised the wreckage around the gusher, and, perceiving that somehow they were in the presence of tragedy as well as of triumph, maintained a bombardment of questions. Sitwell had been moved into a tent, where Denison sat beside him, regarding his unseeing eyes with mute satisfaction. The unknown God had spoken—that influence about which Gertie had come so near the truth—and in no uncertain sound.

It was to Claudia that Edith, cutting short her transports, turned with blessed understanding. She monopolised the girl, warning away even Shanklin, till the madman disappeared in a closed car, commandeered from an astonished tourist and guarded by Denison. Gertie, who refused to be separated, sat on the front-seat. Then Edith and Hunt carried off Claudia. Shanklin watched silently, still held off by Edith's imperative signals. So the group dwindled till, except the knot of visitors that constantly passed up from the highway and back again, there remained only Spencer Martin.

Shanklin stared for a moment at the two torpedoes. His brain was numb, but the sight of the big man standing so motionless set up a triumphant vibration that ran tingling through his body. What had Spencer Martin to say now?

The broad, uncouth figure came slowly towards him, a travesty of itself, blood-streaked, spattered with oil, torn by Sitwell's maniac fingers, but, for all that, a man vested with brutal courage and a stranger to fear.

'Well, you've won out.' He extended a wide, fat palm. 'That well is making twenty thousand barrels.'

Shanklin looked at the hand, and suddenly it became a loathsome thing, emblematic of fraud and crooked practice—the pudgy fingers vested with dangerous powers—the hand that had led Sitwell to lunacy, and would not hesitate to repeat the gesture when again the occasion arose.

'By God—you swine!'

The bloated face quivered for a moment, and the small green eyes receded. Harrison had overheard, and came up, standing without a word beside his partner. Martin took a long breath and seemed about to speak, but a glance at the two men held him silent. Then, with head bent forward and massive jowl set tight, he walked slowly away through the mist of oil, that last word ringing in his ears.

The gaze of the two followed him till he disappeared behind a cluster of tourists grouped just clear of the black spray. Harrison took a long, deep gulp of pure air.

'Jack,' he said whimsically, 'did Spencer Martin eat all of that second pie?'

Chambers's Journal
SEVENTH SERIES

A GOSSIP ON BOOK-TITLES.

By Sir GEORGE DOUGLAS, Bart.

I.

IN a discussion of book-titles in his *Curiosities of Literature*, the elder Disraeli remarks that an author should ever have 'the fear of his title-page before his eyes,' and goes on to cite Tooke's *Diversions of Purley* as a misleading title, and *Moral Essays* as an inappropriate one for Montaigne's 'immortal history of his own mind.' Well, without for a moment aspiring to cast my net so wide as the compiler of the above-named miscellany, let me be permitted to add a few remarks in lighter vein to his learned omnium-gatherum, and to apply them more especially to the titles of modern novels.

What are the main requirements of a good title? To this I should be inclined to reply that it must be both apt and appetising, must strike the ear or the imagination beforehand, and the sense of fitness afterwards. There are, of course, many instances of one of these requirements being met at the expense of the other. Thackeray's masterpiece, I think, is one. For, judged as an appeal to the imagination, *Vanity Fair* is treasure-trove indeed! But does it answer the test of applicability? Is it a fit description of the sordid history of the Crawley family, set off though that history be by endless touches of human nature, and redeemed by an underplot so pure and tender as the love-story of Dobbin and Amelia? Surely not, unless in a very general sense. To me the title seems to promise a brilliant picture of the world's temptations: a painting on a broad scale of the light, luxurious, heartless if you will, but glitteringly attractive side of life, such as Daudet gave us in *The Nabob*, but such as is very niggardly supplied by the scenes of the ball before Quatre-Bras and the theatricals at Gaunt House. Of course, Thackeray had a preference for ugliness, or at least for painting it, as many a gifted artist has had both before and since his day. But in Vanity Fair ugliness is out of place. Were it otherwise, the booths might close, for the fair would do small trade.

Before Thackeray's day most of the great novelists chose personal names for their titles, and though they generally added the words 'Adventures of' or 'History of' so-and-so, with often a goodly adjunct of subsidiary information, these appendages are invariably dropped. Defoe's *Moll Flanders*, *Roxana*, *Colonel Jack* are all sounding titles. But what magic resides in the syllables *Robinson Crusoe*! How much of it is inherent, and how much due to association, it would be difficult to say; but there is certainly nothing corresponding to it in literature. Crusoe is king of the realm of boyhood's fancies, and countless gallant and adventurous lives have been shaped at his instigation. In his choice of titles Samuel Richardson follows Defoe. His *Clarissa* and *Sir Charles Grandison* remain figures of world-wide repute. But I wonder how many of my readers have followed their fortunes to the end. Yet I know of scarcely any more soothing literary ploy, of none that grows and gains more steadily and insensibly on the reader. These are books for quiet country-houses and for rainy days—successive rainy days. In *Amelia*, *Joseph Andrews*, and *Tom Jones*, Fielding, too, affects the personal title. For breadth and typical quality *Tom Jones* could not be beat. No other name could so well suggest the ordinary full-blooded young Englishman, who has his full share of animal propensity, but whose heart is in the right place—or, at least, is generally considered to be so, though, for my own part, without pleading puritanism, some of his acts stick in my gullet. I shall be told, of course, that allowance must be made for eighteenth-century manners. I maintain, however, that, whatever may have been his parentage, the foundling has a dash of the *canaille* in his composition. In other respects Tom Jones is John Bull in his nonage. Like Fielding, Smollett affected proper-name titles, but Smollett's are the more poetic, the less realistic—designed, as in *Roderick Random* and *Peregrine Pickle*, in defiance of probability, to convey a foretaste of the hero's character. Even Dickens, one of the most original of our great writers, was not above borrowing from Smollett's books, so loved by him in boyhood. For, surely, the assault of Nicholas on Squeers is but Tom Bowline's assault on the schoolmaster over again. This may be a case of playing to the gallery, but, while boys are boys, it will always be an assured bid for success. Dickens's name-titles aim at mere abstract fantasy in sound rather than at suggesting character, and certainly *Pickwick*, *Oliver Twist*, *Barnaby Rudge*, and *Martin Chuzzlewit*

 [*All Rights Reserved.*]

are conspicuously successful. But where Dickens deserted the name-title, he sometimes went astray. *Bleak House* and *The Old Curiosity Shop*, it is true, are excellent; but *Our Mutual Friend* lets him down rather badly. Or so, at least, it seems to me. For, though I love noble Lizzie Hexam and fear sinister Bradley Headstone and Rogue Riderhood, and, in short, know the book perhaps as well as most readers of my years, I am not ashamed to confess that I 've no notion either who the friend was, or of whom he was the friend. Again, whilst clearly realising that the title *Great Expectations* refers to Pip's prospect of inheriting Miss Havisham's money—a prospect, by the way, with which circumstance so strangely juggled—I am certainly by no means so sure that that is the *clou* of the book. On the whole, then, Dickens did best with name-titles. And he was probably conscious of this when he christened his last book after the publican whose signboard confronted him on emerging from Gad's Hill.

II.

Sir Walter Scott's titles are, without exception, models of terseness, euphony, imaginative suggestion, so what wonder if later romantic novelists—Lyttons, Disraelis, Ainsworths, Stevensons—have been content to take their cue from him? He it was who popularised, if he did not invent, the place-name title, as a variation on the personal name. And what could be richer in picturesque suggestion than, say, *The Bride of Lammermuir* or *Peveril of the Peak*, or more evocative than *Kenilworth*? Him Ainsworth followed with *The Tower of London* and *Windsor Forest*, titles of kingly breadth and dignity, of which the books that bear them are not unworthy. And, by the way, this collocation of authors' names suggests the reflection that, if a man so witty as the Merry Monarch could but have divined what romances were to be written about him, he would have gone out of his way to visit Woodstock and Ovingdean Grange after Worcester Fight, which the Boscobel Tracts assure me that he neglected to do.

In *The Black Dwarf* and *Redgauntlet*, Scott seems also to have foreshadowed what I may call the colour-title, which is worth mentioning because, unless appearances are fallacious, it certainly brought good luck to the books to which it was applied—for example, Hawthorne's *Scarlet Letter*, George Cupples's *Green Hand* (figurative), Crockett's *Lilac Sun-Bonnet*, one of his earliest successes, as well as the up-to-date *Scarlet Pimpernel* of the Baroness Orczy and *The Blue Lagoon* of De Vere Stacpoole, to which I must add the delightfully intriguing title of the *Yellow Frigate*, which I used longingly to contemplate on bookstalls as a schoolboy homeward-bound, though, as I never got it read, I must presume that the two shillings went in butter-scotch instead.

With her *Sense and Sensibility* and *Pride and Prejudice*, Scott's realistic contemporary, Jane Austen, devised something new in titles—new, but not, I think, happy. Certainly these titles are anything but inevitable. For it takes time and ingenuity, after enjoying the history of Elizabeth Bennet and her sisters, to fit the title to it. And so with the other book or books. I have stood upon the Cob at Lyme Regis, my mind filled with the touching charm of sweet Anne Elliot, and yet quite at a loss to say upon whom *Persuasion* had been brought to bear or what it had effected. 'Why, how dull you must be!' brighter readers will exclaim. So I hasten to protect myself by acknowledging that it was long since I had read the book. Those personal associations with books would make an article in themselves. But possibly it would be one of those lucubrations which are pleasanter to write than to read. So let me be content to touch the subject very lightly indeed. I recall that it was at a *table-d'hôte* at Bologna, in the autumn of 1882, that I first struck the name *John Inglesant*, and that afterwards for many months I heard no new book spoken of but that. Well, writing close on forty years later, I can still state as my opinion that Shorthouse's masterpiece just missed being a great romance, and that that miss was due to the preponderance of the 'subjective' in Johnny, with whose thoughts we are familiar whilst we fail to realise his presence. The novel of all others, however, which has for me the most tender and appealing associations is Wilkie Collins's *Woman in White*, for it was by means of that book that I was first brought into touch with the world of fiction. It was in 1860, when the novel was running its course in the green-covered monthly parts of *All the Year Round*, and I was still under four at the time. Yet I can recall the vague sense of interest, deepening to awe, that took possession of me while I listened (of course, understanding but little) to the voice of my aunt as, in the growing twilight, she read the story aloud to my mother out-of-doors. And I specially remember my aunt's beautiful foreign pronunciation of the oft-recurring name of Laura. It was my first peep into a world where, since that day, many of the happiest—no, of the most tranquil and enjoyable hours of my life have been spent.

Among the many new types and fashions in titles which from this time onward had their vogue, the provocative and the puzzle titles deserve mention. Of the latter, Collins's *No Name* and Whyte-Melville's *N or M* (Nina or Maude, was it not?) are good examples. Of the other kind, *Can He Forgive Her?* and *What will He Do with It?* are standard examples, though I am not sure that I don't prefer the bold, pistol-in-your-face manner of *Why Paul Ferrol Killed his Wife*—a romance which, many years ago, had its day of notoriety, and was at the time reported to be the work of a clever deformed lady who had married a very handsome husband. And,

by the way, why *did* Paul Ferrol kill his wife? I wonder if there is any one now extant who could answer that question.

And now, to wind up with, just a single word as to my own personal predilections and dislikes in titles. It was the younger Brontë sisters, I believe, Emily and Anne—wild, passionate souls imprisoned in fragile clay—who first struck the keynote of untamed natural scenery in the names of their books, with *Wuthering Heights* and *Wildfell Hall*. Those are titles which appeal to me and set my imagination working. And yet I don't think they have had many imitators to speak of, except perhaps Miss Florence Warden in her ingenious criminal story, *The House on the Marsh*. Titles which by sheer attractiveness have led me to buy the books which bore them are Charles Lever's *A Day's Ride*, *A Life's Romance* (deficient in terseness, and yet irresistible); *The Boudoir Cabal*, by Eustace Grenville-Murray, who sometimes wrote under the pseudonym of the 'Roving Englishman,' and whose title conjures up appetising visions of fair and subtle-brained intriguers at their work of moulding destinies; and, lastly, for the present, *A Conspiracy of Silence*, by 'George Colmore' (Mrs Colmore Dunn), which promises all I could possibly want in the nature of dark suppression of essential facts by the sinister means of fingers laid on lips and significant glances exchanged. To conclude, the style of title I most dislike is the cheap pun—of which I may give two examples, drawn from books to which the great British public has long since given its unqualified approval. These are Andrew Lang's *Lost Leaders* and Ian Hay's *Safety Match*.

MAN'S WORK.

CHAPTER XV.

I.

SO, amongst hidden depths of the earth, the honour and the toil of men, the fortitude and the love of women, found their great reward. Harrison's bit, eating through the hard crust that overlay a great pool, had tapped the compressed accumulation of ages. It was a matter only of capping the flow and letting the breast of the world distribute her largesse. Not only was this well a gusher of fortunes, but the land around had acquired a value beyond all dreams of the past.

It was days before they achieved any real conception of the truth. The rush of oil men; the publicity; the growing general belief that behind it all lay that more thrilling than any gusher; the invasion of lessees who met the partners' terms with uncomplaining alacrity; the drone of work, as derrick after derrick sprang up around them—all this induced a sense of unreality that was but slowly dissipated.

The personnel, too, had changed. Edith and the half-stupefied Hunt departed for Catalina, after the latter, during a curt talk with Martin, had handed in his resignation. He had a feeling, as Edith's story unfolded, that he wanted to bathe in the sea and free himself from an uncleanly contact.

Martin was rolling back to New York. He sucked at his black cigars, staring silently out of the window. California, he decided, offered no further advancement. Claudia's face was erased from a mind which grappled dully with something that not only puzzled him, but even made him a little anxious. He had ruined many a man, but not one of them had gone mad before. The destruction of reason seemed more formidable than that of fortunes. He contemplated this for hours, little dreaming that he himself was but a power of destiny—a necessary factor in the complex development of his country, by whom and through whom the spirit of progress was mysteriously evidenced. Had he been told that it was his chicanery, through the agency of Sitwell, that had called forth every opposed strength of courage, determination, and loyalty, he would only have shrugged his massive shoulders and grunted contemptuously.

Harrison was divided between new duties, a sense of embarrassment over his wealth, and a profound joy in that his girl had come back to him. He did not think much of the money that poured in, knowing how little he asked for himself, but was grateful for what it meant to Gertie and Denison. Since it was not money that united them, it would not be money that held them together. He bought a few clothes, hung about Los Angeles for an empty day or two, then took up his abode in the little ranch-house, and pursued the steady custom of his life—which was work.

Claudia stayed in her boarding-house under the care of a warm-hearted landlady. There was no need for it, because Shanklin sent her a cheque on account, one-twentieth interest in the property. She had examined it with incredulous eyes. It was, he explained in writing, only an estimate, but conservative, and she might expect further remittances month by month. She lingered over his signature with a sensation of having been swept into a backwater of life where she could revolve aimlessly year by year while the main river swept indifferently by. Sitwell, in his padded room, had a stronger hold on her now than when his calculating brain was at its sharpest. He was only the wreck of a man, beating out a blind life against the bars;

but so long as he lived she must wait, however empty her soul of joy and peace. She saw Shanklin but seldom, not trusting herself to come so near the gates of her desire. These sequestered weeks gave her beauty a new and wistful touch of tenderness.

Shanklin, for his part, did not question her decision. He saw Burley as often as he could, and found in Harrison a temporary anchorage for his restless spirit. He dared to long that Sitwell would die, and wondered for what baffling purpose life should be fostered in that insensate shell. He saw to it that the patient had every care, but did not go near the asylum, being told that Sitwell shouted constantly, cursing Claudia, Martin, and himself. His own future was so simple as to be almost uninviting. The promised thrill of freedom and power passed like a dream. He realised that this was a phase that must shortly end, and he would soon face existence again, equipped as never before. But in the meantime he had a queer liking to chat with Harrison, and spend long solitary hours watching the new pipe-line curve into the distance, and listening to the hum of work on new leases around his gusher.

In these hours he seemed to acquire a new perspective of the world and himself. He perceived the inchoate mass of humanity, divided in itself, but moving nevertheless by definite stages toward some, as yet, invisible goal. He heard the murmur of this multitude, of its effort and strife. He saw the puny failures and successes of men absorbed into one great conglomerate matrix in which, however potent they had seemed to be, they were indistinguishable from the surrounding bulk. Where in all this was he going to fit in without love?

II.

One evening, when the declining sun painted the Sierra Madre in fairy tints, Jack Shanklin lay, face to the skies, listening to a far, clear call that reached him from the world of men. The time for rest was over. He recognised this quite definitely, and even wondered why it had not sounded before. Then he sat up with an odd consciousness of human presence. Claudia was standing at a little distance. As he stared, she moved uncertainly towards him.

He went to meet her with a sudden breathlessness, and at the sight of her face all speech left him. Her eyes were wide and glorious, but in them were shadows of mystery, and her face was touched with awe. Tall and graceful she stood, lovely with every allurement of the body, but expressing as well the white purity of her soul, a guardian spirit, an altar for worship, a flame for man's inspiration, a harbour at his journey's end.

'Claudia!' he whispered. 'Claudia!'

'Jack!'

She swayed a little, but something sent him a swift warning. He did not move.

'I want to tell you that—that Bertie died three days ago. I tried to find you, but——'

'I've been away,' he said shakily.

'He was conscious just for a little while. He sent you a message—you and Harrison—then he wanted to die. His mind began to go back over everything, and he got frightened.' She shuddered at the recollection. 'It was dreadful.'

Shanklin put his hand on her shoulder. 'What was the message?'

She trembled at his touch. 'The best man wins,' she breathed faintly. 'It was the last thing he ever said.'

'Claudia, what do you say?' His own voice sounded as coming from a long way off.

Through the gathering dusk drifted the perfume of jasmine. At arms' length these two, on whom destiny was now smiling, gazed at each other till Shanklin drew her suddenly close. Gone were all memories of toil and stress; forgotten was every moment when fate hung in the balance. A wind from invisible fields blew through his spirit. 'Claudia, you're mine—you're mine!'

She gazed up at him with eyes in which moved unfathomable things. In them he discerned that which painted life in noble colours, making it a thing of pride and companionship, throbbing with joys and sanctified with tears. Here was his harbour, the home of his spirit.

THE END.

SALISBURY PLAIN.

THE cowslip studs the velvet folds
Of emerald Sarum's wide expanse;
Like golden stars upon the robe
That clothed some queen of old romance,
Anemone and hyacinth
Carpet each tiny woodland glade,
Gleaming like jewels rich and rare,
Set in a green-veined shield of jade;
A purple orchis here and there
Raises a single vivid plume,
Weaving, with thyme and violet,
A tapestry on nature's loom.
On flickering pinions raised, a hawk
Scans from his vantage earth and sky,
Flashes like lightning down, and then,
With laden talons, soars on high.
Through wood and copse, now faint, now loud,
The cuckoo's halting call resounds,
And every briar, every bush,
With teeming life and song abounds;
From pearly dawn till opal eve
Poises the lark athwart the blue,
Pouring, with undiminished voice,
His heavenward psalm the long day through.
Then, when new-born, the horned moon
Sheds her pale beam o'er dale and hill,
Hushed the lark's song, and down the night
Floats a soft sorrow-burthened trill;
For on the night's enchanted ear
Sounds a first flute-like, throbbing note:
A nightingale pipes to his love,
Ambushed in some still grove remote;
A pause, and then upon the gale
Bursts their alternate hymn of pain,
Filling the woods with ecstasy
Till dawn's faint light appears again.

GUY COLIN CAMPBELL.

THE SEVEN LAMPS OF ADVOCACY.

VI.—THE LAMP OF JUDGMENT.

By His Honour Judge PARRY.

The Seven Lamps of Advocacy are *Honesty, Courage, Industry, Wit, Eloquence, Judgment, and Fellowship*

I.

JUDGMENT inspires a man to translate good sense into right action. I would not quarrel with the philosopher who describes judgment as an instinct, but I would bid him remember that even an instinct is acquired by 'cunning' rather than luck. Let no one think that he can attain to sound judgment without hard work. The judgment of the advocate must be based on the maxim, 'He that judges without informing himself to the utmost that he is capable cannot acquit himself of judging amiss.'

A client is entitled to the independent judgment of the advocate. Whether his judgment is right or wrong, it is the duty of the advocate to place it at the disposal of his client. In the business of advocacy judgment is the goods that the advocate is bound to deliver. Yet he is under constant temptation to please his client by giving him an inferior article. The duty of the advocate to give only his best is wisely insisted upon by Serjeant Ballantine, who relates a personal experience that all advocates must be ready to face.

'The solicitor instructing me,' he writes, 'was vehement in expressing belief in his client's innocence. I was of a different opinion. He, acting upon his belief, desired that certain witnesses should be called. I, governed by my convictions, absolutely refused to do so, offering at the same time to return my brief. This, however, was refused, and I was left to exercise my own responsibility. The above question frequently arises, and some counsel have considered themselves bound to obey the wishes of the solicitor. There is no doubt that this is the safest course for the advocate, for, if he does otherwise and the result is adverse, he is likely to be much blamed, and the solicitor also is exposed to disagreeable comments; but I hold, and have always acted upon the opinion, that the client retains counsel's judgment, which he has no right to yield to the wishes or opinions of any one else. He is bound, if required, to return his brief, but if he acts against his own convictions he sacrifices, I think, his duty as an advocate.'

II.

An advocate of judgment has the power of gathering up the scattered threads of facts and weaving them into a pattern surrounding and emphasising the central point of the case. In every case there is one commanding theory, to the proof of which the facts must be skilfully marshalled. An advocate with one point has infinitely greater chances than an advocate with twenty points.

Rufus Choate was an advocate of great judgment, and not only was he enthusiastic and diligent in searching for the central theory, or 'hub of his case,' as he called it, but having made up his mind what it was, he rightly put it forward without delay, believing that it was the 'first strike' that conquered the jury. Parker, his biographer, tells us that 'he often said to me that the first moments were the great moments for the advocate. Then, said he, the attention is all on the alert, the ears are quicker, the mind receptive. People think they ought to go on gently, till, somewhere about the middle of their talk, they will put forth all their power. But this is a sad mistake. At the beginning the jury are all eager to know what you are going to say, what the strength of your case is. They don't go into details and follow you critically all along: they try to get hold of your leading notion, and lump it all up. At the outset, then, you want to strike into their minds what they want—a good, solid, general view of *your* case; and let them think over that for a good while. "If," said he emphatically, "you haven't got hold of them, got their convictions at least open, in your first half-hour or hour, you will never get at them at all."'

Abraham Lincoln had a genius for seeing the real point of his case and putting it straight to the Court. A contemporary who was asked in later life what was Lincoln's trick with the jury replied, 'He saw the kernel of every case at the outset, never lost sight of it, and never let it escape the jury. That was the only trick I ever saw him play.'

Sir Henry Hawkins held the same view. He used to say, 'Concentration is the art of argument. If you are diffuse, you will be cut up in detail.' And he was fond of quoting the teachings of Denman on this subject: 'Remember also to put forward your best points first, for the weak ones are very likely to prejudice the good ones if they take the lead. It would be better advice to say never bring them forward at all, because they are useless.'

Johnny Williams, who appeared with Brougham and Denman for Queen Caroline, was a man of great sagacity, but much given to strong expletives. He was once induced by an attorney, against his own better judgment, to ask a question, the answer to which convicted his client on a capital charge. The circuit considered he was well justified, when the trial was over,

in turning to the attorney and saying with great emphasis (formal expletives omitted), 'Go home, cut your throat, and *when* you meet your client in hell, beg his pardon.'

But an apology was also due from Williams for surrendering his judgment to that of his attorney.

III.

In nothing does the advocate more openly exhibit want of judgment than in prolixity. Modern courts of justice are blamed by the public, not wholly without cause, for the length and consequent expense of trials. To poor people this may mean a denial of justice. No one desires that the judge should constantly interfere with counsel in the discharge of their duties, but it seems to be his duty on occasion to blow his whistle and point out to the combatants that they are offside.

If every one connected with the trial of an action were to train and use his judgment and co-operate with the judgments of his fellow-workers in a policy of anti-waste, a great reproach would be lifted from our courts of justice.

Prolixity is no new disease. Many wise judges have sought to eradicate it. In the time of Charles II. things seem to have been in a specially bad way, and Lord Guildford, though he probably went to dangerous extremes, was well thought of by the public for his endeavour to speed up the legal machine.

'In his lordship's conduct of trials he was very careful of three matters: (1) To adjust what was properly the question, and to hold the counsel to that; for he that has the worst end of the staff, is very apt to fling off from the point and go out of the right way of the cause. (2) To keep the counsel in order; for in trials they have their parts and their times. His lordship used frequently to inculcate to counsel the decorum of evidencing practice. (3) To keep down repetition, to which the counsel, one after another, are very propense; and, in speeching to the jury one and the same matter over and over again, the waste of time would be so great that, if the judge gave way to it, there would scarce be an end; for most of the talk was not so much for the causes as for their own sakes, to get credit in the country for notable talkers. And his lordship often told them that their confused harangues disturbed the order of his thoughts; and, after the trial was over, it was very hard for him to resume his method and direct the jury to comprise all the material parts of the evidence. Therefore he was positive not to permit more than one counsel of a side to speech it to the jury, by way of summing up the evidence; and he permitted that in such a way as made them weary of it. For, in divers sorts of trials, he wholly retrenched it; and where he observed much stiffness and zeal of the parties in a cause, then, after the evidence was over, he would say, "Come, make your speeches;" and then sat him down; and looked with a sort of contempt of their talents, which gave them a distrust and discomposed their extempore so much that, for the most part, they said, "No, we will leave it to your lordship." And thus the abuse, by fastidious talk, wore away; and the practice before him was so well known, as it became at length a pure management of evidence and argument of law.'

The judgment of an advocate may be called upon at any moment for a sudden decision that may mean the victory or defeat of his client. For this reason it is necessary that he should be always alert. The contents of his brief must be already in his mind, and his attention must be fixed on what is happening in court, which has rarely been foreseen in the best-prepared brief ever delivered to counsel.

It was Russell who turned round to his junior and said, 'What are you doing?'

'Taking a note,' was the answer.

At which Russell burst out in his uncompromising way: 'What the devil do you mean by saying you are taking a note? Why don't you watch the case?'

'Watch the case!' It is a golden rule.

It was the same when he was playing cards. He would get impatient with a partner shuffling and handling his cards in a state of indecision. 'Why are you looking at your cards?' he asked. 'Why don't you watch the game? The game is on the table.'

In the same way an advocate who is always fumbling with his brief when he is examining a witness cannot follow the game that is on the table before him.

IV.

Sound judgment is essential to the examination of witnesses. How few advocates know how to examine a witness-in-chief! Birrell tells us that Sir Frank Lockwood had very clear views on the subject. 'He believed that the examination of a witness-in-chief, or the direct examination of witnesses, as it was called in Ireland, was very much underrated in its significance and its importance. If they had to examine a witness, what they had got to do was to induce him to tell his story in the most dramatic fashion, without exaggeration; they had got to get him, not to make a mere parrot-like repetition of the proof, but to tell his own story as though he were telling it for the first time—not as though it were words learnt by heart; but if it were a plaintive story, plaintively telling it. And they had got to assist him in the difficult work. They had got to attract him to the performance of his duty, but woe be to them if they suggested to him the terms in which it was to be put! They must avoid any suspicion of leading the witness, while all the time they were doing it. They knew perfectly well the story he was going to tell; but they destroyed absolutely the

effect if every minute they were looking down at the paper on which his proof was written. It should appear to be a kind of spontaneous conversation between the counsel on the one hand and the witnesses on the other, the witness telling artlessly his simple tale, and the counsel almost appalled to hear of the iniquity under which his client had suffered.

'It was in this way, and in this way alone, that they could effectively examine a witness.'

There is probably more waste of time and irrelevance in the examination of witnesses-in-chief than in any other procedure of counsel. This is the modern drama of it.

COUNSEL (*his eyes glued to his brief*): 'Your name is Mary Ann Snooks.'

WITNESS (*annoyed*): 'Martha Ann.'

COUNSEL: 'Oh yes, Martha Ann Snooks; and you are the wife of Thomas Snooks, the bookmaker.'

WITNESS (*very indignant*): 'Nothing of the sort.'

COUNSEL: 'I beg your pardon--my mistake—bootmaker.'

WITNESS: 'And has been this thirty year——'

COUNSEL: 'And you live at 139 Doncaster Street, Upper Tulse Hill.'

WITNESS: 'We did live there; we've moved now, sir.'

COUNSEL: 'What is your present address?'

&c., &c., *ad lib.*

Consider for a moment, if you will, the horrid waste of all this irrelevance standing between the Court and Mrs Snooks's version of what she saw of an accident in High Street, Kensington, and reducing her to a state of nervous irritation antipathetic to accurate testimony.

How much more business-like was the method of the eighteenth century! In a State trial in the days of Queen Anne the name of the lady is announced in the oath, and then counsel approaches her, as Sir Frank Lockwood might have done: 'Pray, madam, will you be pleased to acquaint my lord and the jury what you know concerning the matter, and what passed between your brother Mr Colepepper and Mr Denew at his first coming to him?'

Much public time could be saved by more economical methods of examination-in-chief, and greater efficiency would be ensured.

v.

Cross-examination, too, is almost entirely a matter of judgment. Two golden rules handed down from the eighteenth century, and maybe from beyond, are still unlearned lessons to each succeeding generation of advocates:

1. Never ask a question without having a good reason to assign for asking it.

2. Never hazard a critical question without having good ground to believe that the answer will be in your favour.

Serjeant Ballantine has some just observations on the art of cross-examination and the use and abuse of it.

'The records of justice,' he says, 'from all time show that truth cannot in a great number of cases tried be reasonably expected. Even when witnesses are honest, and have no intention to deceive, there is a natural tendency to exaggerate the facts favourable to the cause for which they are appearing, and to ignore the opposite circumstances; and the only means known to English law by which testimony can be sifted is cross-examination. By this agent, if skilfully used, falsehood ought to be exposed, and exaggerated statements reduced to their true dimensions. An unskilful use of it, on the contrary, has a tendency to uphold rather than destroy. If the principles upon which cross-examination ought to be founded are not understood and acted upon, it is worse than useless, and it becomes an instrument against its employer. The reckless asking of a number of questions on the chance of getting at something is too often a plan adopted by unskilful advocates, and noise is mistaken for energy. Mr Baron Alderson once remarked to a counsel of this type, 'Mr ——, you seem to think that the art of cross-examination is to examine crossly.'

How few advocates have the capacity to let well alone! They must repeat and emphasise, and emphasise and repeat. In a case tried before Sir Henry Hawkins, a junior, not content with his own witness's answer, continues:

JUNIOR (*emphatically*): 'And you are quite sure of this?'

WITNESS: 'Yes.'

JUNIOR: 'Quite?'

WITNESS: 'Quite!'

JUNIOR: 'You have no doubt about it?'

WITNESS: 'Well, I haven't much doubt, because I asked my wife.'

SIR HENRY (*pouncing on his prey*): 'You asked your wife in order to be sure in your own mind?'

WITNESS: 'Quite so, my lord.'

SIR HENRY: 'Then you had some doubt before?'

WITNESS: 'Well, I may have had, my lord.'

It is part of the advocate's rôle to make the jury believe in his infallibility, and every question he asks that gives the witness an opportunity to score off him and belittle him in their eyes is an error of judgment. Serjeant Buzfuz, who conducted his case with fine judgment, was guilty of a grave error in his examination of Sam Weller. Brow-beating is always a dangerous policy; it antagonises the jury and leads to reprisals. There is an old story of the counsel in an assault case who asked the witness at what distance from the parties he was at the time of the assault. Not content with the reply of 'A few feet,' but pressing for greater accuracy, he was answered by the witness: 'Just four feet five and a half inches.'

'How do you come to be so very exact, fellow?' asked counsel sternly.

'Because I expected some fool or other would ask me, so I measured it.'

A good story, too, is told against Lord Coleridge in Mr O'Brien's *Life of Lord Russell.* He appeared in a libel action for a young lady who had been expelled from a college. His case was that the breaches of discipline were trivial, and he pressed Mrs Kennedy, the mistress of novices, asking what his young client had done. Mrs Kennedy said, as an example, that she had eaten strawberries.

'Eaten strawberries!' exclaimed Coleridge. 'What harm was there in that?'

'It was forbidden, sir,' replied Mrs Kennedy simply.

Coleridge should have accepted her answer, but he retorted with a contemptuous question, not foreseeing the reprisal, 'But, Mrs Kennedy, what trouble was likely to come from eating strawberries?'

'Well, sir,' replied Mrs Kennedy, 'you might ask what trouble was likely to come from eating an apple, yet we know what trouble did come from it.'

Coleridge's cross-examination dissolved in laughter, in which, of course, he joined good-naturedly.

The art of re-examination, which is a task often as futile as the endeavour to set Humpty Dumpty on the wall again, can be learned only by the experience of watching the game on the table and playing any few remaining cards in your hands with rapid judgment.

A wise student will take Lord Halsbury's advice and go to the Old Bailey to study cross-examination; and, if Lockwood's view still holds good, he might attend the Chancery Courts to learn how not to re-examine. Birrell tells us that 'once, in the Court of Chancery, a witness was asked, in cross-examination by an eminent Chancery leader, whether it was true that he had been convicted of perjury. The witness owned the soft impeachment, and the cross-examining counsel very properly sat down. Then it became the duty of an equally eminent Chancery Q.C. to re-examine. "Yes," said he, "it is true you have been convicted of perjury. But tell me, have you not on many other occasions been accused of perjury, and been acquitted?"'

Most re-examination intending to rehabilitate the character of a witness is apt to make matters worse.

These stories of actual happenings, trivial in themselves, teach us the necessity of judgment in advocacy. And I pray the young advocate not to rejoice too merrily over the errors of judgment of his seniors or lament too grievously about his own. Bear in mind that by acknowledged error we may learn wisdom, and that the only illuminant for the lamp of judgment is the oil of experience.

SAMSON AND THE DELILAHS.

PART II.

IV.

THE leaping flames of the fire lit up the scene with strange effect, shining on the dark faces of the men, and half revealing, half leaving in shadow, the huge forms of the restless elephants. This was a *kheddah* party, sent out by a rich *zemindar*, or landholder, who had paid a large sum to the Government of India for the *kheddah* rights of the district—that is, permission to catch wild elephants in it. The method usually employed by such private individuals, and adopted by this party, is to despatch a number of well-trained cow-elephants—their *mahouts* crouching on their necks and concealed under dark cloths—into the forest to find and approach a wild male. Guided by their riders, they endeavour to retain the male in their company and keep him constantly on the move, until he is thoroughly fatigued and resigns himself to a heavy sleep. Then the treacherous females close in on him, and a couple of their *mahouts* slip down noiselessly from their necks and bind his hind-legs firmly together, so that he awakes to find himself a prisoner. Until he is captured each tame elephant falls behind in turn to allow of her driver being relieved by other men, who follow with a spare elephant carrying the food and bedding of the party, and extra ropes and chains to secure the prisoner when he is taken. These reliefs are effected twice in twenty-four hours, and enable *mahouts* to get food and rest. With the extra elephant are two or more *puhlwans*, men armed with guns, usually old muzzle-loading muskets, to be used in case of necessity against a dangerous captive or an attacking beast of prey.

Their food eaten, the men sat round the fire and smoked, while the old *mahout*, Shaikh Ebrahim, described the happenings of the day, and descanted eloquently on the perfection of Samson. He told how they had first come upon his tracks, and found the spot where he had lain down to sleep the previous night. They had been able to gauge the size of his tusks accurately by measuring their impression in the soft ground where the huge head had rested. They were following up his trail when he had turned back to meet them. Ebrahim's narrative provoked tales of former hunts from the other men, until

the *havildar*, who was the head *puhlwan* and in command of the party, bade them pile wood on the flames, and told off some of their number to act as a sentry and reliefs, to keep guard and replenish the fire throughout the night as a protection against wild beasts. Then one by one the men stretched themselves on the ground, pulled their blankets or *rezais* (quilts) over their bodies and heads, and slept.

Before dawn began to filter through the leaves overhead, the loud crowing of jungle-cocks proclaimed its coming. The men awoke, yawned, sat up and stretched themselves, and cleared their throats with the raucous coughs beloved of the Oriental in the early morning. Shaikh Ebrahim called his coolie, the groom whose duty it was ordinarily to wait on his elephant, and who was now to relieve the *mahout* for the next twelve hours on her neck.

'*Ahré*, Gul Dad,' the old man said to his understrapper, a young Afghan, who as a boy had fled to India from his native country to escape a blood-feud. 'Take thy food and blanket, and unshackle Moti. Let her have her head when ye start, and she will guide thee to the others. For me this is to be the day of *aram* [rest].'

Gul Dad tied his bundle to his *kamarband*, threw his blanket on to Moti's back, and, standing facing her, seized her ears, one in each hand, and placed his bare feet on her trunk. The well-trained animal raised him until he could clamber on to her head and swing himself astride her neck.

'*Chel*' ('Go on'), he cried, kicking her under the ears with his heels; and Moti lumbered off.

The rest of the party did not hurry. There was nothing that they could do until the tusker was captured; and in the meantime it behoved them to keep well out of his way. So they prepared to break their fast. A fireplace was built with stones, and a handful of dry twigs kindled in it. Man Singh, who, being a Rajput, was of sufficiently high caste for any Hindu of the party to take food and water from his hands—Mohammedans have no prejudices about caste—mixed a quantity of *atta* (flour) with water in a brass dish, rolled the dough into balls with his hands, patted these into flat cakes, and spread them on a convex iron plate, called a *towa*, placed over the fire. When they were browned on one side he turned them over, flipping them deftly with his fingers, until the other side was equally toasted. They were now *chupatties*. He lifted them off and stacked them in little piles—he had to bear in mind that the absent *mahouts* had also to be fed. On a small flat stone he minced up green chillies, onions, turmeric, and black peppercorns, and with a round stone crushed, rolled, and mixed them into a paste with a little water, and thus made curry. He distributed a little of this and a handful of *chupatties* to each of his companions. The Hindus withdrew, and each one ate his meal apart, while the Mussulmans fed together. Man Singh then finished his own repast. Besides acting as cook and *bheesti* (water-carrier) for the party, he was Gulabi's *mahout*; and, while eating, he bade his coolie unshackle her and let her loose to graze. When she showed any tendency to stray too far away, he called reprovingly to her; and the elephant, starting at the sound of his voice like a naughty child rebuked, sneaked back with a guilty air.

After a smoke and a chat the *havildar* gave the order to get ready to move on. Gulabi's coolie led her up. While Man Singh was busy cleaning his cooking-utensils, the other men lifted the heavy pad, bound it on her back, and loaded her with the bedding, chains, and ropes. The *havildar* went to her tail, rapped her hind-leg until she lifted it into the air to enable him to place his foot on it and step up to reach the crupper-rope, and the coolie mounted after him. Man Singh, seizing Gulabi's ears, was lifted on to her neck by her trunk. The party started, two of the men, on foot, going on well ahead to pick up Moti's trail and guard against the danger of stumbling unawares on the decoy elephants and their dupe.

V.

All through the night the Delilahs had been stirring, for their *mahouts* had kept them moving around the unsuspecting Samson to prevent him from resting. Their object was to tire him so thoroughly that, when at last he would be overcome by sleep, it would be so profound that the men could safely approach and bind him. When dawn came all began to graze; but the decoys were not allowed to move far from the spot where they had passed the night. Consequently they were soon found and joined by Moti and her new rider, who, like the rest, was concealed under a dark blanket. It is strange that in this method of hunting the tusker does not always wind and discover the men on the tame elephants' necks. Some do, and never let the decoys get near them; but others remain to the end as confiding as Samson was.

On Moti's arrival one of her companions was made to wander out of sight, and then taken to find the rest of the *kheddah* party, one of whom relieved her *mahout* and brought her back to play her rôle of Delilah again. During the morning the other riders of the decoy elephants were similarly changed.

Throughout the day Samson was never allowed to rest. His treacherous charmers played the same game as on the previous afternoon, always cajoling him, always drawing him on, but never permitting him to approach too near, lest he should discover the men on their necks and take fright. The trained elephants, accustomed in captivity to work all day long, were not put out by the loss of the noonday siesta. The tusker, who should have felt the deprivation acutely, did not seem to miss it, and appeared as wide

awake and as little inclined to sleep as they. The concealed *mahouts*, watching him through peepholes in their blankets, marvelled at his vigour and at the strength he displayed in uprooting trees, and began to despair of ever tiring him out and catching him off his guard.

'*Havildar-ji*, he is a *shaitan* straight from Eblis, that *dhantwallah*,' said Gul Dad with conviction when he returned with Moti at nightfall. 'We all, men and elephants, are weary, worn out; but the *budmash* [rogue] is as fresh as ever.'

The *havildar* pulled thoughtfully at the long stem of his gurgling pipe, made out of a coconut-shell, and blew a cloud of acrid smoke into the still air.

'Then he must taste of our *dhawa* [medicine],' he said. 'Shaikh Ebrahim, do thou take it with thee when thou departest in the morning.'

'*Bahut atcha*' ('Very good'), replied the old *mahout*, sucking at the stemless bowl of his earthen pipe. 'I do not like to use it, but—*hukm hai* [it is the order].'

And when, the next morning, he swung his leg across Moti's neck and drove her forward, he carried under his blanket two bundles of sugar-cane cut into short lengths. One, the smaller, contained pieces drugged with opium. In the other the cane was not doctored.

Ebrahim soon caught up with the others, and found Samson as lively and wakeful as ever. When in the early afternoon of this, the third, day of the chase, he still seemed fresh and not inclined to sleep, the old *mahout* took Moti a little ahead of the rest, and in a spot clear of undergrowth scattered pieces of the undrugged cane about on the bare ground. The other elephants were manœuvred to bring them and the tusker on the spot. Samson, to whom sugar-cane was unknown, for it does not grow in the jungle, sniffed it suspiciously and would not touch it. But when he saw his companion eat it greedily, he ventured, after a good deal of hesitation, to try the new delicacy. It was much to his taste. And so, when later on Ebrahim dexterously contrived to drop pieces of the drugged cane in his path, he devoured them readily.

The opium soon took effect. Before long the tusker nodded drowsily, lay down, and stretched his great body on its side. For some time his ear was lifted and dropped regularly and mechanically, falling with a flap that echoed through the forest like a pistol-shot. Then Samson slept the heavy sleep of the drugged.

VI.

Cautiously the hidden riders forced their elephants to gather close around the unconscious victim of their wiles. Then one by one they revealed themselves, thankfully flinging aside the stifling blankets.

'*Kali Maki jai!*' ('Victory to mother Kali!'), exclaimed a Hindu *mahout*, wiping his streaming face with the end of his *puggri* (turban). 'I feared that the *shaitan* would never sleep.'

Shaikh Ebrahim broke off a dry branch from a tree and hurled it at the slumbering colossus. It fell on his ribs, but Samson never stirred. Then two of the *mahouts* slipped down from their elephants, each with a length of thick rope in his hand. One picked up a hard lump of clay, and, from a distance, threw it at the tusker. It struck him heavily on the skull, but elicited no movement from him. The other *mahouts* forced their reluctant elephants close up to him and ringed him round; while the two men on foot crept stealthily between the tame animals' legs and touched the sleeper, at first timidly, then more boldly.

'The *sug* [dog] is as the dead,' said one contemptuously; whereupon he and his companion proceeded to tie the unconscious brute's hind-legs together with ropes they carried. Another *mahout* threw them a longer piece, stout as a ship's hawser, and this they used to tie one leg to a tree.

'*Shabash!*' ('Well done!'), cried Shaikh Ebrahim when Samson lay effectively enmeshed in the toils. He shouted loudly to call up the rear party with Gulabi, while the other *mahouts* slipped off their elephants to the ground. One or two of the animals stretched out their trunks and timidly touched the sleeper; then all of them, freed from their *mahouts*, strayed away to feed. The work of the Delilahs was done. Poor Samson was ensnared, and lay a fettered and helpless captive.

The men gathered about the prize, marvelling at his size. They boldly slapped his rump in derision, and fingered and measured his enormous tusks. Old Ebrahim, who had not dismounted from Moti, turned her round and set off at a brisk pace to find and guide the *havildar* and the others to the spot.

When he returned with them the tusker still lay fast asleep. The new-comers joined in the chorus of wonder and congratulation. Ebrahim slid to the ground and spanned one of the tusks.

'In the name of God!' exclaimed the Mussulman *havildar*, 'never have I seen such an animal. A Rustum among elephants. *Ahré*, brothers, this will mean much reward for us. A rajah would give twenty thousand rupees for such a one to carry his state *howdah*.'

'*Khubbadar! Khubbadar!*' ('Take care!'), cried out Gul Dad, who had taken Ebrahim's place on Moti's neck. '*Khubbadar; the shaitan* awakes.'

The men scattered. The tusker stirred, slowly opened his eyes, and lifted his head. Evidently the drug was not potent enough to keep him long unconscious. He looked about him with a dull, uncomprehending stare. Then he extended his trunk and sniffed the air. Suddenly understanding came to him, and he seemed to realise all at once that there were enemies

around him. He tried to rise quickly, but was hampered by his bound legs. He fell; and the watching men, confident in the strength of his bonds, laughed, and shouted derisive remarks at him. He struggled to his feet. When he realised that he was a prisoner his fury was terrible. He trumpeted shrilly and tried to charge his jeering captors. The treacherous Delilahs paused in the act of conveying food to their mouths to stare affrightedly at him. The men continued to deride his wild and futile struggles.

'*Shabash! Kiya tumasha!*' ('Well done! What an entertainment!'), cried Gul Dad in high glee, restraining the startled Moti from bolting by pounding her thick skull with the *ankus*. She was barely out of reach of the maddened tusker.

'*Durro mut, O Moti*' ('Don't be afraid, O Moti'), said Ebrahim, walking to her head and rubbing her trunk to reassure her. 'The *budmash* cannot hurt thee. See! he is dancing to amuse thee.'

He stopped in front of the fiercely struggling beast, and just beyond his reach saluted derisively.

'*Salaam, O Maharaj; salaam, Jungal ka Badshah*' ('Salutations, O Maharajah; greeting, King of the Jungle').

The tusker glared furiously at him out of his vicious little eyes, and, straining still more madly at his bonds, hurled himself at his tormentor.

VII.

Suddenly the *havildar* shrieked a warning: '*Bagho! bagho!* [Run! run!]. The ropes are breaking.'

The men yelled and fled in all directions, as the stout hawser that fastened the captive to the tree parted suddenly. Almost at the same moment the cords binding his legs gave way. The maddened brute charged furiously at Moti, on to whose head Ebrahim was trying to climb. She turned to flee. Too late. Samson crashed headlong into her, burying his tusks in her side. She was knocked down, falling with stunning violence to the ground, and flinging Gul Dad from her neck. The other elephants, infected with the panic of their men, stampeded. The *havildar* and Man Singh clung to Gulabi as she fled, and tried to clamber up on her pad. They succeeded in doing so, and Man Singh sought to stop her; while the *havildar* endeavoured to unfasten his musket, which was tied to the pad.

When Moti fell, Shaikh Ebrahim was knocked down. But he rose and attempted to run. The savage tusker rushed at him, hurled him to earth, and then crushed the old man's skull to a bloody pulp under his huge forefoot. Gul Dad, who had picked himself up, ran to his *mahout's* rescue, not seeing that he was too late. The gallant young Afghan, drawing the *kukri*, or curved knife, stuck in his waistband, boldly confronted the infuriated beast and slashed at his trunk, inflicting a deep gash. It was his last action. The tusker swung round at him, gored, kicked, pommelled, and pounded him to death. Man Singh had succeeded in arresting Gulabi's headlong flight, and now brought her back; while the *havildar* feverishly poured a charge into his muzzle-loading musket, spilling half the powder from his shaking hands. Capping the nipple with trembling fingers, he fired. But the bullet struck the tusker on the side of his thick skull, glancing off and merely inflicting a slight wound that only served to infuriate him more. With a shrill scream, he charged Gulabi, who swung round and bolted in terror, the two men on her crouching flat to escape being torn off by the low branches.

The tusker pursued her for a short distance, and then returned to the scene of the tragedy. Moti had taken advantage of his absence to scramble to her feet and escape. But the bodies of her men lay crushed and disfigured. The savage brute went back to them, and trampled and kicked Ebrahim's poor, mutilated corpse into a shapeless mass devoid of all semblance to humanity. Next, placing a foot on Gul Dad's body, he wound his trunk around the thighs, seized the legs in his mouth, literally tore them from the rest of the battered carcass, and flung them twenty yards away. Only then was his vengeance sated.

Moving a little away from his victim, he kicked up earth to plaster on his wounds. Then, with the light of battle still in his eyes, Samson, free once more, stalked proudly off through the forest, his heart filled with hatred of the whole race of his new enemies—a hatred that many men were to rue bitterly in the years to come.

THE END.

OUR FRIENDS—TREES.

LORD! I have loved Thy trees,
  Thy spreading cedars and Thy stately firs;
In happy haunting memories of these,
  My slow old pulse even yet swiftly stirs;

Of lime-trees' odorous breath,
  Of birchen tresses waving in the wind;
Of yews defying the stern doom of death,
  Though round their roots some shadowed graves we find;

Of ash-trees near our homes,
  And kindly oaks with wondrous carven leaves—
Forgive me, Lord, if sometimes o'er me comes
  A sigh of vain regret; my spirit grieves.

I love the burnished woods,
  That scatter gold with royal lavish splendour;
Dear are the April merry-hearted moods
  Of fairies, when the buds are small and tender.

The beech and sycamore,
  The ivy clinging to my sheltering wall—
But I have now seen budding springs fourscore,
  And soon must leave friends, home, and trees—and all!

MARION BUCHANAN.

THE REDSKIN OF THE NORTH PACIFIC COAST.

By Charles E. Alford.

I.

SLOUCHING along the road in a tattered suit of tweeds and a battered 'trilby,' the Redskin, as we see him to-day, presents indeed a sorry spectacle when we think of his former glories and the part he played, not so many years ago, in the history of the great North-West. Yet there is a brighter side even to this sad picture. Though the tomahawk, the feathers, and all the gorgeous trappings we loved so well have gone, alas! the way of all things, the American Indian is, even now, a picturesque figure; and that he still retains many of the finest qualities of his race was amply demonstrated in the recent war, when no less than 35 per cent. of the Indian male population of military age, though exempted from the operation of the Canadian Military Service Act, volunteered for active service—and, what is more to the point, covered themselves with glory. But the fact remains that the Redskin of to-day is but a shadow of his former self. The white man is not entirely to blame for this, but I sometimes think, when we go into raptures over our much-vaunted civilisation, that we should at least do well to lower our voices.

Compared with his cousin of the interior, the Indian of the Pacific Coast is not, it must be confessed, a very imposing individual. Short and thick-set, with flat nose and high cheek-bones, he might well be mistaken for a Chinaman, were it not for his darker skin. Unlike the Celestial, however, he is now but a poor simple creature, happy only when fishing and hunting, and caring not a fig for the busy world around him. The younger men, it is true, are employed in some numbers in the canneries; but high wages and the facilities for spending their earnings in the local towns lead only to the devil where native races are concerned.

Generally speaking, however, the Pacific Coast Indian is a quiet, inoffensive fellow, and, when not under the influence of 'fire-water,' most law-abiding.

Each tribe lives on its own reserves, granted by the Government. Though it is, of course, only right that they should receive the pick of their native soil, this concession is rather wasted in the case of the Coast Indians; for they care nothing for husbandry, and, with rare exceptions, the only 'improvements' to their credit are the picturesque but evil-smelling shacks they erect for the accommodation of their families. These Indian villages, with their rows of little gray wooden cabins and painted totem-poles, are familiar sights along the shores of the Pacific Coast and its adjacent islands, and when viewed from the sea, with their magnificent background of fir and mountain, are beautiful beyond words. Even at close quarters, and despite the filth of their surroundings, they are not without a certain squalid picturesqueness; whilst the spectacle of these strange folk, dressed as they are in all sorts of quaint garbs, standing or lying about in various corners of their quiet little beach, some sleeping, others idly playing with some paltry task, conveys to the nerve-racked stranger from the outer world an atmosphere of *laisser faire* that is singularly soothing. Enormously fat old squaws, their heads enveloped in brightly coloured handkerchiefs, waddle to and fro 'twixt house and beach, spreading their filthy garments to dry in the sun; whilst the younger women, in blue cotton frocks, their long black pigtails decked with gaudy ribbons, sit about in little groups playing rather prettily with their small papooses. Their men-folk, too, if indeed they be not away on some fishing expedition, have plenty to keep them occupied. Clad as a rule in red or white sweaters and heavy sea-boots, and all of them puffing briar pipes or cigarettes, they potter up and down the beach, some repairing their little green canoes, others mending tackle or polishing spinners in readiness for the next expedition. And all around, children and dogs and screws of filth and paper roll and tumble about on the beach in evil-smelling clouds of dust and sand.

II.

But if there is squalor without, there is still more squalor within. Let us now peep inside one of the cabins. We must first, however, obtain permission from Crimson Dawn—the man in the white sweater and sea-boots sitting by the doorway mending nets. A short, stoutish individual, with dark, piercing eyes, a long, drooping moustache, and a mop of raven-black hair bulging beneath his cap, there is something about Crimson Dawn that we cannot altogether help liking. Though he is all smiles, there is none of that cringing and grovelling one so often notices in other native tribes; indeed, so natural is he, yet so dignified, that we wonder how many of our modern hostesses, blessed with an equally magnificent name, would bear it half so well. Having motioned us to step inside, and intimating by a courtly sweep of the arm his desire that we should make ourselves thoroughly at home, with a cheerful nod he leaves us in possession. It is indeed a fusty apartment. The first thing that catches the eye is a large log-fire burning merrily away in the middle of the room, and around it, hanging from beams in the ceiling, rows of large fish—salmon, by the look of them—in various

stages of curing. There is no chimney, no outlet of any kind save the door, which is seldom open. Even the one solitary window is innocent of sash or hinge. The result can only be described as terrific. Lest, however, this rather cryptic adjective should leave the reader cold, let him try to picture himself inhaling the hot, sickly smell of fish and lamp-oil through clouds of blinding smoke, and he will perhaps feel more sympathetic. Salmon lie about everywhere—on the floor, on the chairs, even on the wooden bunks which serve the occupants as beds. There are no carpets, no curtains. In a corner, by the door, stand two sporting-guns, a rifle, and sundry spear-heads used for spearing salmon; whilst on a table at the end of the room two empty whisky-bottles and a broken mug hint darkly of 'crimson dawns.' Other articles of furniture include a weather-beaten tin trunk, a blue enamel slop-pail, and a sewing-machine by a well-known British maker. For the rest, from floor to ceiling it is just bare boards, relieved here and there, however, by coloured prints cut from ancient Christmas Numbers and nailed to the walls. And that is all.

Back once again in God's fresh air, half-choking, half-blinded with the smoke, we suggest to our host that the addition of a chimney might make his abode even more delightful—supposing that to be possible—than it is already. But Crimson Dawn only smiles. 'You want smoke salmon want much smoke; fire want shut him in; chimney no damn good;' so there is nothing more to be said. But Crimson Dawn will suffer in the end, as his fathers have before him, for many of these Indians go blind in their old age, and the doctors attribute this entirely to the effects of the smoke.

III.

Though each tribe has its own reserves, they do not always remain in the same village throughout the year. Weather and other conditions frequently render a change of quarters absolutely imperative, and for this purpose they usually have one or more spare villages, which are used at different seasons, according to their suitability. On the west coast of Vancouver Island the only connection with the outside world is by the steamer from Victoria, which makes the journey about three times a month; and during bad weather it is not unusual for her to anchor off a village, only to find the whole place deserted, the inhabitants having moved to more sheltered quarters, perhaps a mile or so away. For their frail canoes, though handled with consummate skill, are of little use in broken water, and in the powerful tides that are such a feature of this wild coast they have on more than one occasion been carried out to sea, never to be heard of again.

They are wonderful fishermen, these Indians; indeed, passing as they do the greater part of their lives on the water, they must be almost as familiar with these little bays and creeks as the fish themselves. Their intuition regarding the movements of the salmon is positively uncanny. Sometimes they will shake their heads and say, 'Fish no good to-day,' although the conditions may seem, to all outward appearances, absolutely perfect. Yet, should we be tempted to disregard their advice and try our luck, it is almost a certainty that we shall have a blank day.

When trolling for salmon the Redskin uses his little 'dug-out'—a tiny canoe hollowed out from a tree-trunk, and only barely large enough to accommodate the navigator. Hardly an ideal craft, one would think, from which to entice the gamesome cohoe.* But the Indian takes no chances. As soon as a fish is hooked, it is hauled to the surface with all possible speed, and unless the victim be unusually refractive, no attempt is made to play it. Even so, I have seen these little craft being towed about in all directions by a large and frenzied salmon before the quarry has been finally landed.

Their women-folk, too, are equally skilful anglers, and charmingly pretty pictures they make as they paddle up and down through the silver water, the very poetry of grace and motion. Indeed, one cannot help thinking that they must possess, unconsciously perhaps, the instinct of colour in quite an unusual degree, so wonderfully do their garments blend with the painted loveliness of their surroundings. One that I saw not long ago would have been a joy to any artist. Paddling a little green canoe beneath the shade of some overhanging trees, her rich black hair bound with a green ribbon, and a bright orange-yellow shawl around her shoulders, she might well have been the genie of these wild regions, so naturally did she blend with the green of the waters and the amber tints of autumn on the shore. I have never seen a more pleasing harmony of colours.

All through the day these Indians will paddle to and fro over the same sheet of water, pausing only to unhook a fish or change a spoon; then on again, just like machines. Sometimes we may see dozens of them thus engaged—small urchins, little girls with long black pigtails, buxom squaws (some also with pigtails), withered old hags with nasty tangled hair and bony knuckles, and gray old men just like shrivelled gorillas—all of them paddling, paddling, paddling, softly and silently, to and fro, conscious of nothing save the spangled salmon that splash and play in the waters around them.

Another, and more thrilling, method of catching salmon, indulged in chiefly by the younger men, is by means of the spear. For this purpose the spearman paddles along close to the

* A species of salmon common in the North Pacific.

shore until he finds a stretch of water suitable for his operations—where it is clear and shallow, and not too weedy on the bottom. Having selected a likely spot, he stops paddling, and taking up his missile and holding it poised in readiness to strike, peers intently downwards into the water. For some moments he may remain thus, quite motionless. Then, quick as a flash, down shoots the spear, to reappear, in nine cases out of ten, with a dripping, wriggling salmon impaled on the end of it—a marvellous exhibition of skill when one considers the lightning movements of a fish in its native element.

But perhaps the richest prize that ever falls to the lot of the Redskin in these days is the sea-otter, a species of seal formerly abundant in these waters, but now extremely scarce, a good skin fetching as much as fifteen hundred dollars (some £300 at par). Like others of their kind, these beasts have to come to the surface at intervals in order to breathe, and the Indians kill them by surrounding them in their canoes and forcing the unfortunate brutes to keep beneath the water until they are drowned.

IV.

Though it cannot be said that the average Redskin takes much pride in his personal appearance, I have from time to time met with some very ludicrous exceptions to this rule. One young fellow whom I encountered in a remote fishing-village on the west coast of Vancouver Island I shall not easily forget. Attired in a pair of black-and-white-check riding-breeches, with coat to match, brown boots and leggings, and a 'loud' check cap with a huge peak, he was the most perfect caricature of a racecourse tipster that I have ever seen. He was even chewing the inevitable straw, and with hands deep in breeches-pockets acted the part to such perfection that one could not help wondering whether he had studied the type from a photo in some derelict newspaper, and determined to imitate it.

With his white neighbours the Redskin lives on excellent terms. Though living more or less apart from the world on his own reserves, he is always in and out of the settlements, selling either fish or wicker-baskets (made by his women), or buying tobacco and other necessaries of life from the local store; whilst at many of the up-country inns squaws are employed to do the laundry. Moreover, at the local regattas and other similar functions there are always classes for the Indians, the race of the war-canoes, in which half-a-dozen or so of these craft usually take part, being invariably the most popular event on the programme. These war-canoes, it may be of interest to mention, are about fifty feet in length, and manned by a crew of eleven. In appearance they rather remind one of the familiar shells used in the 'Varsity Boat Race, and, like these, are capable of great speed. There are several large boarding-schools, both Protestant and Roman Catholic, where the younger generation is now being educated in the Christian faith, and excellent institutions they are. There are times, however, when, despite their Christian upbringing, the 'red' in these small Indians will assert itself in no uncertain manner. At one of the Roman Catholic schools, not many years ago, a small girl, on being sent to her room for some trivial offence, deliberately set fire to her apartment, with the result that the whole building was burnt to the ground.

And so it is with all wild creatures, human and otherwise. We may tame them, or think we have, but we cannot change their instincts. As the rising tide of progress creeps remorselessly onwards, they must either sink or swim, and the Redskin, alas! is slowly going under. A few more centuries perhaps, and the last of this once splendid race will have passed to the happy hunting-grounds. Where these may be no man knows, but I always like to picture him returning to his old loved haunts, where

> In the drowsy, dreamy sunshine,
> In the never-ending summer,

he may paddle away as of yore, unseen, undisturbed, in his paradise of solitude.

THE VALUE OF SWAMPS.

By A. W. Thomson.

THE writer is an ardent nature-lover, ornithologist, and snipe-shot of some years' experience. In the course of nature-study he has constantly been impressed by certain points of usefulness of swamp-land that may not fully or generally be realised; and, therefore, he is constrained to put them forward.

During some years of residence in Ireland, he noticed repeatedly that cattle having access to swamps in summer fatten better and more quickly than those kept to the diet of well-drained grazing-fields. Those cattle which, in summer, are so often to be seen up to their stomachs in rich green swamp, lustily feeding on the swamp herbage, seem to come into wonderful condition. Botanists may be able to say why; the writer cannot do so. Possibly the swamp growth contains herbage of a medicinal character not found on well-drained land. On the other hand, swamp herbage possibly forms a change of diet that may be essential to the best results in cattle-feeding, so far as their

portion of food of natural growth is concerned. Possibly the food of the swamp forms a combination of these two advantages. In short, it may be the fulfilment of Nature's definite requirements for the natural fattening of stock.

There are, however, many different types of swamp-land. And, so far as the writer has noticed, much of the marsh-land that commonly goes under the name does not possess the necessary feeding and fattening quality. The real swamp, the natural green mire prolific in bright, rich, green herbage, in which a man sinks above his knees, is a scarce commodity. Such swamps seem to have been regarded as pestilent features in the landscape, and so have been mostly drained away. Sometimes you still come across such delectable spots in the shape of swampy green fields forming the shores of little rush-covered lakelets. There are plenty in Ireland; fewer—much fewer—in this country. But where, as too often proved here, lakeside fields and also those bordering alluvial streams have been drained to firmness, the swamp herbage has gone. The cattle can go into the water and bathe, but the food of the swamp is absent.

There is a vast practical difference in results between the provision of a bathing-tank and a combined feeding and bathing swamp. Enlightened agriculturists who are fortunate enough to possess real swamps on their lands, and have specialised therein, will agree.

The immense fattening value of green swamp, so forcibly impressing the mind of the writer, leads one to consider the common systems of agricultural drainage as a whole. Do we not, as ordinary procedure, tend to overdrain our land? Is it not obvious that we drain so much that, when a prolonged drought comes, we have no alleviation? Scientific irrigation is practically *non est* with us. It is, of course, not always either a desirable or a practical proposition, but much English land might be so manipulated, and certainly some of it with advantage. What must have been the value of his land last summer to the farmer who was lucky enough to possess a few low-lying grass fields over soil always moist? Surrounded, as he probably was, by neighbours whose grass was burnt brown, he could not only feed his own beasts, but could also, at considerable profit to himself, fatten some of his neighbours'.

Human nature is so prone to proceed from one extreme to the other in seeking cure from trouble. Modern farming is based on the cultivation of very thoroughly drained land, rather than on land drained under a carefully-thought-out scheme comprising the draining of certain fields to a lesser degree than others. As to swamps, the idea has been to drain them all. The precept 'Never drain *all* your swamps' has not been taken seriously. The last word is not yet said as to the uses to the agriculturist of water, and its manipulation. The average proprietor, or his agent, makes a fetish of draining—if he can spare the money to carry it out. Through their very keenness to make the best of land, do they not, sometimes at all events, defeat their own end? The point that appears to have been overlooked is that it is one thing to drain to reclaim utterly waste-land, and quite another to drain all the water off every field on a farm.

Farming is a difficult profession. Only the keenly observant, far-seeing, and clever man can score possibles at the game. So many look on the field that is covered with water during much of the winter as only a pitiable thing. As for the green swamps, which have appeared to the mind of the present writer as the Mecca of fattening stock, these are lamentably scarce, and to the detriment of English beef, alas! It is a common thing in life that we know scarcely enough to know how little we really know. And, in ignorance, we often attempt to improve on Nature's best, which, having been designed to fulfil a special purpose of its own, is incapable of improvement so far as that purpose is concerned.

A MYSTERY OF THE EUPHRATES.

THE story of the siege of Samawah has been told in print by more skilful pens than mine. From it we learn that the defence vessel *Greenfly* ran aground while patrolling the river Tigris between Samawah and Kidr, where the Arab tribesmen made continuous efforts to capture her.

But what of the *Greenfly*; and what is the story of her capture?

She was one of the fleet of smaller armoured gunboats built to patrol the Euphrates and the Tigris. She mounted two 13-pounder guns, besides several machine-guns. Her fighting crew, in addition to the ship's officers, consisted of six gunners of the Royal Artillery, with an escort of an Indian officer and fourteen rifles from one of the regiments at Samawah, besides the ordinary complement of Indian stokers and lascars for working the ship, who were, of course, non-combatant.

She ran aground in about three feet of water, some sixty yards from the river-bank, where she was soon discovered by the Arabs, who perpetually sniped her. Various attempts were made to put rations into her by aeroplane, but most of these were picked up by the enemy, and the last bit of food she is known to have got from outside was a sheep sent up by the

Political Officer of the relieving column, in charge of a friendly Arab. This was acknowledged, and a few days later the aeroplanes reported the ship was holding out no longer.

Then arose in the relieving column persistent rumours, gathered from Arab sources, that the white men had been murdered by the Indian escort, who handed over the ship to the enemy.

When the gunboats with the relief force came abreast of the *Greenfly*, a boat was sent off to examine her, but its crew returned, saying they could not face the smell on board. On this, a British officer went, and found the ship had been thoroughly looted, the guns and everything movable taken out of her, and then she had, as far as possible, been burnt. There was only *one* much-decomposed body in the ship, that of a very big man, obviously a European, who had two wounds, one in the leg and another through the chest, which last had evidently killed him. There were no other bodies, not even traces of them; they had probably been thrown overboard. The officer, knowing the rumours which were prevalent, then looked most carefully at the decks and inside the vessel to see if there were any bullet-marks which would tend to show that the British had been murdered when they were in their cabins, but he could find nothing to confirm this idea.

After Samawah was relieved, one of the lascars was recaptured, and a day or two later a wounded sepoy of the escort was found by a patrol. These men told a most extraordinary tale when brought before the Court assembled to inquire into the circumstances of the loss of the vessel. Of course, they had been kept apart and were examined separately, to avoid any collusion. The substance of what they told was as follows.

The *Greenfly* ran aground going down-stream, and every attempt to get her off failed, owing to the strength of the current. The Arabs soon discovered her difficulty, and by day kept up heavy rifle-fire, which could be answered only by rifles and machine-guns, as the banks were too high for the big guns to fire over. Whenever fighting took place, the non-combatants were invariably sent below, to be out of the way.

At night some one who could speak Hindustani, supposed to be a deserter, used to call out to the escort to murder the white men and give up the ship, and then they would be rewarded and receive good treatment. Let them well consider this, and if they decided to do what was wanted, they were to fire two shots from a big gun as a signal they had done so.

The witnesses stated that hitherto the casualties on board were not heavy; only the big sergeant, who worked a machine-gun in the fighting-top, was shot through the thigh, and one of the Indian escort had his arm broken. These two were, of course, in hospital. No one was killed till the very end. Rations got very short, and there was no word of early assistance.

One night fire was opened from the bank for a short time, which was rather unusual, and the lascars went below. Soon they heard heavy firing and movement on deck, which continued for some minutes, and then stopped; but there was no more firing from the shore. Immediately the noise on deck ceased two bombs exploded—one in the river, so close to the ship that water splashed on board; no rifle-shot was fired after that. A minute or two later the vessel was boarded by many Arabs—men, women, and even children—who soon discovered the lascars below, dragged them out, and took them ashore, whilst others looted everything they could lay hands on.

Before they left the ship they saw no bodies on deck, but the fact that the moon had not yet risen might have accounted for this. By the time the vessel was set on fire and everybody ashore, the moon was up, when it could be seen that the Indian officer and his men were all together in one party, and the lascars in another; but there were no white men. The lascars were told that all the British had been killed, though none of the Indians had lost their lives. The Arabs then took them away, the lascars being kept separate from the sepoys.

The sepoy witness said he actually saw nothing of what went on on deck, as he was below in hospital; the lascar told a similar story. The only material difference in their evidence was as to the time the firing on deck continued: one said five minutes, the other twenty. Both were positive that no big gun was fired, but that two bombs were thrown at the end. They knew nothing of the Indian officer and other members of the escort and crew, except that they supposed they were still with the Arabs or Turks.

The Court could elicit no details of the fate of the British officers or soldiers, but it seems highly probable that these bombs were thrown after they were killed, either because the big guns had been disabled, or the Indians did not know how to fire them; and also that the sepoy was careful only to describe what he actually knew to have happened before he was taken ashore, for, as he was kept with the rest of the escort after that, it is inconceivable that he should not have heard how it was that the only casualties which occurred were confined to the British, whilst there was not one amongst his Indian comrades.

There would seem to be good reason for supposing that the white men were surprised by the Indians, for they would scarcely have gone down without accounting for some of their opponents. The loss of the *Greenfly* may well be termed a mystery of the Euphrates, as no one who was on board her, except the two men who were recaptured, has ever been heard of since.

IONIDES.

By COUNTESS OF CROMARTIE, Author of *The Golden Guard*, &c.

PART I.

CHAPTER I.

THE ship of Hamilco of Carthage, the disreputable old slave merchant, was off on the raid among the Isles of Greece. Hamilco's reputed son, Mathabal, was with them, a tall, beautiful, sullen-eyed youth in a ragged, fringed tunic and a Phrygian cap. He always seemed to stand strangely aloof from Hamilco's vicious-eyed crew, even when, later, his deeds matched theirs. They had not met with any human merchandise on this particular voyage, save one small child kidnapped off the Isle of Samos.

Little Ionides was barely six years old. That his mother, a fair, golden-haired maiden of a noble house, had fallen an easy prey to one of the wild Phœnician sea-rovers who haunted the coast, Ionides was never to know. She had died. And the fair-haired, black-eyed baby had been handed over to the tender mercies of a harsh-featured old peasant-woman, whom he vaguely supposed to be some relative of his. The hut where he lived stood upon the flower-starred shore on the edge of the sea. There, playing among the flowers one evening, he had fallen into the hands of some of his father's nation. Young Mathabal's arms had gone about him like a serpent's coils, and the child's startled yell of terror was stifled against the hand over his mouth.

Once on the slave-ship outward bound, Ionides had neither screamed nor complained. Limp as a little dead thing, he had gazed wide-eyed at the callous, dark faces surrounding him, with a blind stare in his long-lashed dark eyes. He knew that Hamilco had wrenched his scanty white tunic from him with a growl of approval at the physical perfection of his tiny figure. For being stripped naked he did not care—he often went totally unclad, after the Greek custom; but he was afraid—horribly afraid—of the cruel eyes of the captain and his gang. He looked like a forlorn little cupid as he stood there on the deck in the blazing sunset, his golden curls damp with terror, and his tiny hands hanging limp at his sides.

The captain had gone. Zarkim, one of the crew, an evil-eyed young ruffian with huge brazen rings in his ears, flung back his head with a laugh and some evil jest at the child's terror. Next instant Zarkim had measured his length on the deck, and young Mathabal, cursing venomously, stood over him.

Ionides gazed up at his captor hopelessly. To him Mathabal looked as dangerous as the others—perhaps worse. He could not understand what his flood of vituperation meant, and as the fight between the two raged up and down the deck, he shrank away from the clashing of the curved knives, and hid himself under shelter of the red sail.

Like all his kind, young Mathabal could speak Greek. The fight over, and his opponent gone to bandage a sliced arm, he hauled Ionides out of his hiding-place, and grinned at him encouragingly. A slow smile dawned over the terrified baby face. It was late night now, and Ionides shivered as the ship swung out to sea before a light breeze. Away at the helm of the ship a lantern swung, showing the steersman's figure dark and distant.

'Where is thy tunic?' said Mathabal. 'Oh, here!' He caught up the minute white thing, knelt, and reclad Ionides. Very timidly the baby hand went up, and touched his face, and one of the heavy rings in his ears. 'Cold?' asked Mathabal.

The large dark eyes regarded him trustfully, and, with no word at all, Ionides swarmed up to his neck like a kitten, and clasped both dimpled arms about his throat. Mathabal rose with the child still coiled about his neck, pulled from behind a coil of rope a thick silken rug that he had filched from Hamilco's cabin, and lay down under shelter of the scarlet sail.

Ionides was very sleepy. The agony of suspense in his baby mind was gone, with this new kindness towards him, and he was not shivering any more. He buried his little nose in the ragged scarlet tunic on Mathabal's breast, clutching a handful of the rough red stuff in one tiny fist, and so fell asleep.

Mathabal had neither known nor shown any tenderness towards a single human being in his life till that hour. Young as he was, nothing had ever come across his path to break the flint

 [*All Rights Reserved.*]

of Phœnician hardness, which could be that of the nether mill-stone; but, as with nearly all his race, under much apparent callousness was a sort of fierce tenderness for any weak thing, child or animal, that trusted him, as this kidnapped babe apparently did trust him. The strangeness of the thing kept him awake, when usually he would have slept the sleep of a conscienceless young animal. The little body against his heart was very soft and warm, and the golden curls of the small head buried against him were glinting in the moonlight that forced its way under shelter of the red sail.
